Art. 15, para. 1, of the Federal Constitution proclaims the latter to be applied directly (meaning that public bodies and officials ought to abide by its rulings regardless the legislative provisions or by-laws on the respective issues and that a person can refer directly to the Constitution for the purposes of the human rights protection). However, most of the constitutional provisions are not precise enough and require either concretization by the legislator or clarification by the Federal Constitutional Court.

## Federal Constitutional Laws and Other Federal Laws

The Constitution of the Russian Federation provides for two types of federal legislative acts:

- Federal constitutional laws, referring to most important matters specified in the Constitution and being adopted with the consent of qualified majority of the members of both chambers of the Federal Assembly (i.e., the constitutional name of the Parliament of the Russian Federation)
- Other federal laws which can be adopted with the consent of simple parliamentary majority and suspended by the President of the Russian Federation (his veto can be overridden by qualified parliamentary majority)

Besides, a special type of federal laws exists that is roundaboutly mentioned in the Constitution of the Russian Federation as "amendments to the Constitution of the Russian Federation." Complete official title (elaborated by the Constitutional Court of the Russian Federation and by the federal legislator) of the acts of this kind is the "Law of the Russian Federation on the Amendment to the Constitution of the Russian Federation." Enactment of such laws requires majority set for adoption of federal constitutional laws and further ratification by at least two thirds of regional legislatures.

The most important federal legislative sources of constitutional law of the Russian Federation regarding public administration are as follows:

- The law of the Russian Federation on the amendment to the Constitution of the Russian Federation No. 7-FKZ dd. 30 December 2008, "On the Control Powers of the State Duma concerning the Government of the Russian Federation" (it provided for the federal government's duty to report to the lower chamber of the federal parliament annually on the results of its activities, including the issues raised by the latter).
- The law of the Russian Federation on the Amendment to the Constitution of the Russian Federation No. 11-FKZ dd. 21 July 2014, "On the Council of the Federation of

the Federal Assembly of the Russian Federation" (it provided for the right of the President of the Russian Federation to appoint federal representatives to this body; none had been appointed so far, however).

- The Federal Constitutional Law No. 2-FKZ dd. 17 December 1997, "On the Government of the Russian Federation" (it provides for composition of the government, its powers, relationships with federal ministries and other specialized executive bodies, with legislative and judicial bodies, as well as with the regional governments, for the distribution of functions between members of the government, as well as for financial and logistic support for the government and its members).
- The Federal Law No. 184-FZ dd. 6 October 1999, "On the General Principles of Organization of the Legislative (Representative) and Executive Bodies of Constituent Entities of the Russian Federation" (it provides for construction of the regional executives, their formation, their functions and powers, their relations with legislative bodies and with the federal government).
- The Federal Law No. 58-FZ dd. 27 May 2003, "On the System of Public Service in the Russian Federation" (it contains few provisions of constitutional nature, viz., it provides for distinction between public servants and political officials, for the two-tier civil service, and sets common principles for the federal civil service and for the regional one).
- The Federal Law No. 131-FZ dd. 6 October 2003, "On the General Organizational Principles of Local Self-government in the Russian Federation" (it provides for construction of the local governments, their formation, their functions and powers, their relations with the federal and regional governments).
- The Federal Law No. 25-FZ dd. 2 March 2007, "On Municipal Service," provides for distinction between public servants and political officials at municipal level, as well as between municipal service and the "state" service, which refers to public service at both federal and regional levels).
- Federal laws No. 41-FZ dd. 5 April 2013, "On the Accounts Chamber of the Russian Federation," and No. 6-FZ dd. 7 February 2011, "On the General Principles of Organization and Functioning of Control and Accounts Boards of Constituent Entities of the Russian Federation and of Municipal Entities" (the governmental bodies responsible for financial auditing).

C

## "Administrative-Constitutional" Decrees of the President of the Russian Federation

According to Art. 90 of the Constitution of the Russian Federation, the President of the Russian Federation shall issue decrees and orders that should not run counter to the Federal Constitution and to federal laws. Basically, these decisions contain individual rules of administrative nature. However, despite the relative prevalence of such rules, the number of normative acts being issued by the President of the Russian Federation is considerable as well (predominantly, they have the form of decrees). Among such acts, some refer to constitutional matters.

The chances to issue such acts had been being extensively used by the head of the Russian state in the 1990s. During this period of instability and rapid reformation in various spheres, the federal legislator had frequently failed to pass the necessary laws timely. Taking this opportunity, the President used to produce advanced regulations. Besides, during the 1990s, the President of the Russian Federation had frequently proclaimed the Soviet-time laws obsolete and void at his discretion, thereby clearing the field for his own regulations. By the time the federal parliament got round to the issues that had already been covered by the presidential decree, the rules they had contained could become customary, thus leaving no choice for the legislator but to develop the law on the basis of the presidential by-law.

This state of affairs had been legitimized by the Constitutional Court of the Russian Federation in its decision No. 11-P dd. 30 April 1996, on the verification of constitutionality of para. 2 of the Decree of the President of the Russian Federation No. 1969 dd. 3 October 1994, "On the Measures to Ensure Uniformity of the Executive Power in

the Russian Federation," and of para. 2.3 of the Regulations on the Head of Administration of the krai, oblast, city of federal significance, autonomous oblast, and autonomous okrug. According to the court ruling, the practice of issuing decrees by the President in order to make up for deficiencies of federal laws complies with the Constitution, given that such decrees should be brought to conformity with the newly enacted legislation.

Currently, the President of the Russian Federation is the body that neither regularly produces important legal provisions referring to constitutional matters nor acts directly instead of the federal parliament. However, the head of the Russian state possesses enormous political weight, and his legislative initiatives had not been meeting hindrance in the federal parliament in recent years (see chapters ▶ "Head of the State and Public Administration, Russia" and ▶ "Federal Government, Russia"). Thus, nowadays the President of the Russian Federation has no need for the contrivances used in the 1990s.

Nevertheless, decrees of the President of the Russian Federation still play a significant role in regulation of the constitutional matters. Firstly, they refer to the status of a man and citizen. According to the Constitution of the Russian Federation, the President of the Russian Federation solves the issues of citizenship of the Russian Federation and of granting political asylum and decides on pardoning (however, presidential decrees being issued on these issues are individual decisions).

Secondly, the structure of the federal territory and interaction between federal and regional governments are partially covered by the following acts of the federal President:

- Decree No. 1602 dd. 1 September 2000, "On the State Council of the Russian Federation" (this is a deliberative body comprised of federal and regional officials that considers vital matters of federal and regional policies)
- Decree No. 849 dd. 2 February 2000, "On the Plenipotentiary Representative of the President of the Russian Federation in the Federal District" (this act divides the territory of the Russian Federation into federal districts and establishes the offices of the President's plenipotentiary representatives performing monitoring and coordinating functions in these districts)
- Decree No. 337 dd. 24 March 2005, "On the Councils under the Plenipotentiary Representatives of the President of the Russian Federation in the Federal Districts" (these "mini-state councils" serve for discussion and coordination of federal and regional policies within federal districts)

Thirdly, the structure of federal government is to a considerable extent framed by the presidential decrees. The most important of these are:

- Decree Nos. 590 dd. 6 May 2011 and No. 715 dd. 25 May 2012, regarding the Security Council of the Russian Federation
- Decree No. 314 dd. 9 March 2004, setting the forms of federal executive bodies subordinate to the President and to the Government of the Russian Federation (federal ministry, federal service, federal agency), their typical functions, and other basic features
- Decree No. 636 dd. 21 May 2012, setting the composition of the Government of the Russian Federation and enumerating federal ministries, services, and agencies subordinate either to the latter or to the President of the Russian Federation
- Decree No. 32 dd. 11 January 1995, "On the Federal Public Offices" (this document enumerates the federal officials that are considered to be political ones and thus to be excluded from the operation of the legislation on the civil and other public service)
- Decree Nos. 400 25 March 2004 and No. 490 dd. 6 April 2004, on the Administration of the President of the Russian Federation (this body is mentioned in the Constitution of the Russian Federation, but its structure and functions are actually left at the presidential discretion)
- Decree Nos. 1791 dd. 31 December 1996 and No. 792 dd. 22 June 2004, on the plenipotentiary representatives of the President of the Russian Federation in the Constitutional Court of the Russian Federation and in the chambers of the Federal Assembly of the Russian Federation

All these decision are notable for having dual nature, as far as they serve both for settling issues that can be regarded as constitutional ones and for the needs of public administration at the federal level of government.

## Regional Legislation and By-Laws

The structure of normative regulation regarding constitutional issues of public administration varies from one region to another (Kryazhkov 2002). In most constituent entities of the Russian Federation, the basics of the regional executive system, specifics of government formation, and relations between the governor (or the head of the republic), the government (or the administration), and other governmental institutions are outlined in the Constitution (in constituent units enjoying the status of a republic) or in the statute (in krais, oblasts, cities of federal significance, autonomous oblast, autonomous okrugs), while the structure of the regional executive (the set of executive bodies) and distribution of functions between various ministries, departments, agencies, etc. are determined in a specific legislative act and (or) in by-laws issued by the chief official of the region (see chapter ▶ "Regional Executives, Russia").

For instance, in the Tatarstan Republic, the Republican Law No. 64-ZRT dd. 6 April 2005, "On the Structure of Executive Bodies of the Tatarstan Republic," and the Decree of the President of the Tatarstan Republic No. UP-899 dd. 25 September 2015, of the same name, are devoted to these issues. Organization of the executive of Vladimirskaya oblast is set in two regional laws, No. 151-OZ and No. 152-OZ dd. 27 October 2005, "On the System the Executive Bodies of Vladimirskaya Oblast" and "On the Structure of the Administration (the Higher Executive Body) of Vladimirskaya Oblast," as well as in the decree of the regional governor No. 48 dd. 10 June 2016, "On the Structure of the Executive Bodies of Vladimirskaya Oblast." However, in some constituent entities of the Russian Federation, most of these issues are exhaustively settled in the Constitution or in the statute, thus leaving space for the by-laws only. For example, in Vologodskaya oblast, the decision of the governor No. 118 dd. 26 April 2004, "On the Structure of the Executive Bodies of the Oblast," is based on the regional statute directly.

Besides, each of the 85 current constituent units of the Russian Federation has its legislation on the issues of public service (of these issues, the general principles to be observed by the public servants and the rules for transfer from municipal service to the regional one and back can be regarded as the constitutional ones), as well as laws on organization of local self-government, on the municipal service and some other issues that can be partially ascribed to both constitutional matters and matters of public administration.

## Local Constitutional-Like Regulation of Public Administration Issues

Each of some 22,000 municipal entities produces its own regulations regarding both constitutional and public administration issues. The most important among such sources is the statute of the municipal entity. Documents of this kind contain provisions on the structure of the municipal government, distribution of functions between municipal bodies, their composition, formation procedures, types of municipal offices and their terms, etc. Aside from these acts, the representative body of the municipal entity and its head (chief official) are entitled to issue subsidiary decisions on the mentioned matters (see chapter ▶ "Institutional Foundations of Local Self-Government, Russia").

## Decisions of the Constitutional Court of the Russian Federation and Public Administration

The Constitutional Court of the Russian Federation was not destined to take decisions constituting the system of public administration. However, a number of its decisions affect public administration on either federal, or regional, or local level. For instance, in its decision No. 1-P dd. 24 January 1997, on verification of constitutionality of the

Law of the Udmurtskaya Republic dd. 17 April 1996, "On the System of Governing Bodies of the Udmurtskaya Republic," the Court outlawed replacement of the municipal governments with the local bodies of the regional government.

In respect to the latter, the Constitutional Court of the Russian Federation had come to unmatched conclusions. In its decision No. 2-P dd. 18 January 1996, on verification of constitutionality of the statute (the basic law) of the Altaisky Krai, the Court outlawed the procedure of the regional executive formation leading to actual subordination of the latter to the regional legislature. However, by the decision No. 13-P dd. 21 December 2005, on verification of constitutionality of the mentioned Federal Law No. 184-FZ dd. 6 October 1999, the Court legitimated the procedure of "vesting of a citizen of the Russian Federation with the authority of a chief executive of a constituent entity of the Russian Federation" by the regional legislature (this procedure had been used until 2012) upon nomination by the President of the Russian Federation (see chapter ▶ "Regional Executives, Russia").

Several decisions of the Constitutional Court of the Russian Federation are devoted to the general order of government. For example, in the decision No. 28-P dd. 11 December 1998, on interpretation of provisions of Art. 111, para. 4, of the Constitution of the Russian Federation, the Court had established that the President of the Russian Federation may submit the same nominee for the office of the chairman of the Government of the Russian Federation twice or thrice (instead of presenting a new candidate each time). This decision was a significant victory of the head of the Russian state over the lower chamber of the federal parliament, as under the Constitution a thrice-repeated rejection of the presidential nomination shall lead to dissolution of the said chamber. The Court's decision had legitimized the displacement of the whole system of federal bodies responsible for public administration under integrate control of the head of the state.

The decision of the Constitutional Court of the Russian Federation No. 2-P dd. 27 January 1999, on interpretation of provisions of Art. 71, para. "d," Art. 76, para. 1, and Art. 112, para. 1, of the Constitution of the Russian Federation, had further strengthened the position of the President of the Russian Federation. In this decision the Court proclaimed the practice of establishing the system of the federal executive bodies subordinate to the President and to the Government of the Russian Federation, by means of decrees of the latter (instead of the federal laws), to be compliant with the Constitution of the Russian Federation (see chapter ▶ "Head of the State and Public Administration, Russia").

## Conclusions

Although public administration is traditionally regarded as the realm of administrative law, multiple provisions of constitutional law affect the institutional basis of public administration, allocation of administrative functions, interaction of administrative bodies and their officials with citizens, with legislatures, with the judiciary, etc. The scope of this influence varies in the course of time. However, there is no reason to believe that the role of the constitutional basis of public administration is about to decrease. In the foreseeable future, administrative law and constitutional law (as well as international law and financial law) will share public administration as the object of regulation.

This fact is an inevitable manifestation of two well-known circumstances. First, public administration is obviously a highly complex phenomenon that cannot be confined to a single branch of law. Second, division of law into the branches has been becoming increasingly imprecise and relative during the last decades. The precincts of the constitutional, administrative, etc. law still possess some academic significance, but they gradually lose adequacy as the categories describing actual social practice.

# Constitutional Protection of Human Rights in Nusantara Countries

Vadim Atnashev
Department of International and Humanitarian Law, North West Institute of Management, Russian Presidential Academy of National Economy and Public Administration, St. Petersburg, Russia
Faculty of International Relations, St. Petersburg State University, St. Petersburg, Russia

## Introduction

The presented paper is based on the analysis of three constitutions in respect of human rights in the main Nusantara countries – Indonesia, Malaysia, and Singapore.

The articles concerning personal rights are usually placed into separate parts of the constitutions under review, though some provisions can also be given in other different parts. Many international legal norms have been gradually incorporated into the domestic law of all Nusantara countries from the end of the twentieth century, though in the Philippines the process started earlier.

In the constitutions of the Nusantara countries, the principle of equality is the most important constitutional principle of the personal legal status. It corresponds to the democratic principle of equal opportunities and has undoubtedly democratic content, because it prevents the various forms of subordination of some groups by others. However, the concept of equality obviously does not apply to many other human rights aspects regulated by international standards (political convictions, religious and other opinions, property status, etc.).

Besides, unlike constitutions of many countries, both Malaysian and Singapore constitutions do not fix the recognition of the supreme value of human life. There the principle of equality is interpreted *prima facie* as the equality of citizens before the law.

Thus, Article 8 of the Constitution of Malaysia affirms the equality of all persons before the law and entitlement to the equal protection of the law. "There shall be no discrimination against citizens on the ground only of religion, race, descent, place of birth or gender in any law" (clause 2). The next Article 9 states that no citizen shall be banished or excluded from the Federation.

Worthy of notice that the Constitution of Singapore 1963 has a separate article entitled "Equality." It is similar to the provisions of the Malaysian constitution but contents a clause that there shall be no discrimination in the appointment to any office or employment in the public (§2 of Article 12). Interestingly, the Singapore Constitution specially stipulates the position of Malays who are considered as a minority community.

At the same time, for an effective protection of the constitutional rights and freedoms, the international law norms must be transformed into national legislation in accordance with

The author is a professor at the Department of International and Humanitarian Law, North West Institute of Management in the Russian Presidential Academy of National Economy and Public Administration, St. Petersburg, Russia; has a Ph.D. in Oriental Studies from St. Petersburg University; and has a M.L., M.A. from CUF-Sorbonne, St. Petersburg. His research fields include international law, conflict studies, ethnic minorities rights, Champa and Islam in Southeast Asia. In the 1990–2000s, the author conducted fieldwork in the Cham regions of Vietnam and Cambodia and published many articles on the topic.

**Constitutional Protection of Human Rights in Nusantara Countries, Table 1** Participation of Indonesia, Malaysia, and Singapore in the main international human rights treaties

| Name of treaty/convention | Participation | | | Ratification | | |
|---|---|---|---|---|---|---|
| | Ind. | Mal. | Sin. | Ind. | Mal. | Sin. |
| International Covenant on Civil and Political Rights (ICCPR) | + | – | – | + | – | – |
| International Covenant on Economic, Social, and Cultural Rights (ICESCR) | + | – | – | + | – | – |
| Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW) | + | + | + | + | + | + |
| Convention on the Rights of the Child (CRC) | + | + | + | + | + | + |
| Convention on the Elimination of All Forms of Racial Discrimination (ICERD) | + | – | – | + | – | – |
| Convention Against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment (CAT) | – | – | + | – | – | + |
| International Convention on the Protection of the Rights of All Migrant Workers and Members of Their Families (MWC) | + | – | – | + | – | – |

*Ind* Indonesia, *Mal* Malaysia, *Sin* Singapore

international obligations assumed by the states that ratified the core international treaties on human rights. The participation (nonparticipation) of Indonesia, Malaysia, and Singapore in the conventions is shown in Table 1 (see below). However, in the Nusantara region, all seven treaties were ratified by the Philippines only. Even there, as well as in the whole Southeast Asia, the death penalty is not forbidden.

Naturally, the real protection of human rights in Indonesia and Malaysia is not possible without their participation in the Convention against Torture.

In view of the fact that most foreign workers in the region work in Malaysia and Singapore, these states in the first place should become parties to the International Convention on the Protection of the Rights of All Migrant Workers and Members of Their Families.

## Human Rights in the Constitution of Indonesia

The Constitution of Indonesia was adopted in 1945 and contents five short chapters (X–XIV) concerning citizen rights and freedoms: "Citizens," "Religion," "Defense," "Education," and "Social Welfare." It should be noted that the initial project of constitution presumed observance of *shariah* law and compulsory election of a Muslim as the president of Indonesia. However, the provisions were not adopted.

The Xth chapter of the Constitution (Articles 26, 27, and 28) covers issues of citizenship and rights of citizens. The Article 26 stipulates that citizens must be Indonesians by birth or other nationals who acquired the citizenship by law. Unlike Malaysia and Singapore, the Constitution of Indonesia does not fix the procedure of acquisition or termination of citizenship. In the additional clause included in 2000, there is provision that issues of the citizenship and residence in Indonesia are regulated by law (clause 3, Article 26).

Article 27 declares equality of all citizens before the law and state (the defense of which is civic duty) as well as their right to an occupation and "an existence proper for a human being" (though it is far from "an adequate standard of living" (ICESCR, Article 11 (http://www.ohchr.org/EN/ProfessionalInterest/Pages/CESCR.aspx))). The next, 28th article assigns guarantee freedom of association and assembly, freedom of speech and press, and "other similar freedoms." By implication of the Constitution 1945, noncitizens of Indonesia did not possess the abovementioned rights as well as the right to education.

However, the Second Amendment to Constitution entered on 18 August 2000 and added the specific chapter "Basic Human Rights" (its number X-A) that includes ten articles (28A–28 J).

Thus, legislators finally paid attention to and guaranteed the "other similar freedoms." It was also logical that the Second Amendment added the following definition in Chapter X "Citizens and Residents": "residents include citizens of Indonesia and foreigners who reside in Indonesia" (clause 2, Article 26).

Meanwhile, Article 29 (Chapter XI "Religion") initially stipulated that the state basing on belief in the unique God "shall guarantee freedom to all residents to embrace their respective religion and to perform their religious duties," that is, the freedom applies not only to the citizens but to everybody who resides in Indonesia.

Below, we consider the rights and freedoms guaranteed by the Second Amendment 2000. According to the amendment, the basic human rights cannot be limited under any circumstances: "the rights to life, freedom from torture, freedom of thought and conscience, freedom of religion, freedom from enslavement, recognition as a person before the law, and the right not to be tried under a law with retrospective effect" (Art. 28I). Meanwhile, other constitutions of Nusantara countries do not declare some of the rights mentioned.

The following definition seems to be apt in Article 28I: "Every person shall have the right to be free from discriminative treatment based upon any grounds whatsoever and shall have the right to protection from such discriminative treatment" (subsection 2). A special subsection concerns children rights: "Every child shall have the right to live, to grow and to develop, and shall have the right to protection from violence and discrimination" (subsection 1 of Art. 28B).

Besides, Article 28E also guarantees many personal rights some of which are mentioned in other articles:

> (1) Every person shall be free to embrace and to practice the religion of his/her choice, to choose one's education, to choose one's employment, to choose one's citizenship, and to choose one's place of residence within the state territory, to leave it and to subsequently return to it.
>
> (2) Every person shall have the right to the freedom to hold beliefs (*kepercayaan*), and to express his/her views and thoughts, in accordance with his/her conscience.
>
> (3) Every person shall have the right to the freedom to associate, to assemble and to express opinions.

For comparison, according to the 1966 International Covenant on Civil and Political Rights, "No one shall be arbitrarily deprived of the right to enter his own country" (subsection 4 of Article 12).

Article 28G declares the right to protection of self, family, honor, dignity, and property and the right to feel secure against and receive protection from the threats. "Every person shall have the right to be free from torture or inhuman and degrading treatment, and shall have the right to obtain political asylum from another country." The latter right regarding asylum is uncommon disposition for many developing countries. Though, it corresponds to the international legal norms such as the 1967 UN Declaration on Territorial Asylum and the Universal Declaration of Human Rights.

It is important that the protection, advancement, upholding, and fulfillment of human rights have finally been recognized "the responsibility of the state, especially the government... For the purpose of upholding and protecting human rights in accordance with the principle of a democratic and law-based state, the implementation of human rights shall be guaranteed, regulated and set forth in laws and regulations" (28I). It is worthy to note that the modern Indonesia declares itself as the largest democracy in Asia, after India, so reference to "the principle of a democratic and law-based state" is absolutely logical.

As for the social rights and freedoms, there are guarantees of the right to work and to receive fair and proper recompense and treatment in employment, as well as the right to obtain equal opportunities in government (Art. 28D), the right to self-realization through the fulfillment of one's basic needs, and the right to education and to partake in the benefits of science and technology, art, and culture (Art. 28C, part 1). Besides, the assertion of the right "to self-improvement by way of a collective struggle" for one's rights contributes to the formation of political and social identity of Indonesians (Art. 28C, part 2).

The Second Amendment also allocates an article concerning the information right (28F): everyone has the right to communicate and obtain information "for the purpose of the development of his/her self and social environment, and shall have the right to seek, obtain, possess, store, process and convey information by employing all available types of channels."

Another article (Art. 28H) declares that each person is entitled to protection of self, his family, honor, dignity, and his property and has the right to feel secure from fear to do or not to do something. The last part of the same article emphasizes the right to own private property and "such ownership shall not be appropriated arbitrarily by whomsoever" (Art. 28H, part 4). Meanwhile, the "old" Section XIV "National Economy and Social Welfare" (adopted in 1945) still declares the right of "impoverished persons and abandoned children" to be taken care of by the state. According to the Street Children Statistics 2007 of UNICEF, pg. 5), there were over 170,000 street children in Indonesia (Irwanto P. et al. (1999). Situation of Street Children in 12 Cities in Indonesia, Monograph Report for the Asian.

Development Bank, TA No. 3043 INO. Cited in Pinheiro, P. (2007), World Report on Violence Against Children, Chapter 7. P. 295).

The cultural identities and rights of traditional communities shall be respected according to the Article 28I (part 3) that must include indigenous peoples like in the Philippine Constitution.

Besides rights, the Constitution of Indonesia also allocates duties of the citizens and residents of Indonesia. Part 2 of Article 26 defines: "Residents consist of Indonesian citizens and foreigners residing in Indonesia." In compliance with democratic principles, every person in the orderly life of the community, nation, and state must respect the human rights of others. In exercising his/her rights and freedoms, he/she has the duty to accept the restrictions established by law also for the purpose of "satisfying just demands based upon considerations of morality, religious values, security and public order in a democratic society" (Art. 28 J).

Up to 2000, the Constitution declared only the duty of all citizens "to hold without exemption the law and the government in esteem" (part 1, Art. 27), as well as the right and the duty of each citizen to "participate in the defense of the nation" (part 1, Art. 30). Meanwhile, the modified by the Second Amendment part 3 of Article 27 is almost the same as the following provision of Article 30 (part 1):

"Each citizen has the right and the duty to participate in the defense and security of the state" (the words "and security" were added in 2000).

After adoption of the Fourth Amendment to the Constitution (11 August 2002), the citizens not only have the right to education; they are obliged to follow an elementary education but the government has the duty to fund this (Art. 31, part2). At least 20% of the state's and regional budgets are to be allocated to the needs of the education system (Art. 31). Since there is still a high percentage of illiterate population in Indonesia, the provisions are important and progressive and obviously should help to reduce the number of illiterate people.

Implementing national education system should enhance "religious and pious feelings as well as moral excellence with a view to upgrading national life" (part 3 of Art. 31).

Thus, in recent years, there has been a positive movement toward the democratization of many social life aspects in Indonesia.

### Human Rights in the Constitution of Malaysia

The Constitution of Malaysia 1963 in force is one of the most voluminous and detailed not only in Asia, but all over the modern world. Part II of the Constitution, which has the name "Fundamental Freedoms," includes nine articles (Art. 5–13). They reflect main types of the rights of man and citizen – the personal, social, economic, and political rights.

According to Article 5 concerning the personal liberty, "no person shall be deprived of his life or personal liberty otherwise save in accordance with law."

If the high court receives a complaint that a person is being unlawfully detained, the court must consider it – when establishing the illegality of the detention, it shall order to produce the detainee before the court and release him (clause 2, Art. 5).

It is worthy to note that two clauses of the same article are not applied to "enemy aliens" (clause 3 and clause 4, Art. 5):

> (3) Where a person is arrested he shall be informed as soon as may be of the grounds of his arrest and shall be allowed to consult and be defended by a legal practitioner of his choice.
>
> (4) Where a person is arrested and not released he shall without unreasonable delay, and in any case within twenty-four hours (excluding the time of any necessary journey) be produced before a magistrate and shall not be further detained in custody without the magistrate's authority:
>
> Thereby, the right to *habeas corpus* and the said provisions shall apply to those aliens who are not considered "enemy" ones.

The Constitution further provides guarantees against criminal laws in force with retroactive effect and repeated trials (Article 7):

> (1) No person shall be punished for an act or omission which was not punishable by law when it was done or made, and no person shall suffer greater punishment for an offence than was prescribed by law at the time it was committed.
>
> (2) A person who has been acquitted or convicted of an offence shall not be tried again for the same offence except where the conviction or acquittal has been quashed and a retrial ordered by a court superior to that by which he was acquitted or convicted.

The mentioned provision corresponds to the "ne bis in idem" principle enshrined in fundamental international conventions such as the International Covenant on Civil and Political Rights (its Article 14.7).

Article 6 of the Constitution prohibited slavery and all forms of forced labor, though "Parliament may by law provide for compulsory service for national purposes." Meanwhile, according to Act A1130, section 2, in force from 28 September 2001, the end of the cited article was changed as follows:

> (3) Work or service required from any person as a consequence of a conviction or a finding of guilt in a court of law shall not be taken to be forced labour within the meaning of this Article, provided that such work or service is carried out under the supervision and control of a public authority.

The replaced clause defined such work just as "incidental to the serving of a sentence of imprisonment imposed by a court." Thus, now all kinds of works imposed by a court should not be considered forced labor.

Article 9 of the Constitution of Malaysia affirms the right of every citizen to move freely throughout the Federation and to reside in any part thereof (clause 2). This is a natural right and inalienable freedom, which concerns to the basic civil rights and freedoms.

The reflection of such understanding and the inclusion of Article 9 in the part II – "Fundamental Liberties" – is advantage of the Constitution of Malaysia (as well as one of Singapore). Meanwhile, an amendment regarding the right in question was included in the Indian Constitution only in 1978. In the USSR, it was not at all assured, and in the modern Russia, this constitutional right is constantly violated at different authority levels. There are some interesting parallels between Russia and Indonesia, for example, such problems as corruption, xenophobia, and extremism (see Atnashev V.R., Ward K., Terrorism in Indonesia: International Law and Political Aspects (in Russian) ATNASHEV, V.R., WARD, K., TERRORISM IN INDONESIA: INTERNATIONAL LAW AND POLITICAL ASPECTS (in Russian) // Russian Public Policy 2013, No. 5, pp. 42–49).

In accordance with international standards, the mechanism of realization of the right to move freely and choice of residence also includes the possibility of certain restrictions. In the Constitution of Malaysia, they are given in the second clause of paragraph 2 (Art. 9): "Subject to Clause (3) and to any law relating to the security of the Federation or any part thereof, public order, public health, or the punishment of offenders." The formulation is close to the first part of Article 16 of the Italian Constitution 1947.

Besides, paragraph 3 that was added in 1963 says: "So long as under this Constitution any other State is in a special position as compared with the States of Malaya, Parliament may by law impose restrictions. . . on the rights conferred by Clause (2) in respect of movement and residence." This version of Article 9 is still in effect, particularly in relation to the states of Sabah and Sarawak which retain their respective immigration control systems.

Article 11 concerns the freedom of religion and guarantees everyone the right to profess and practice his religion and propagate it. The latter is possible subject to paragraph 4: "State law and in respect of the Federal Territories of Kuala Lumpur, Labuan and Putrajaya, federal law may control or restrict the propagation of any religious doctrine or belief among persons professing the religion of Islam". No one should be forced to pay any taxes, "the proceeds of which is specifically designed, in whole or in part, to the needs of the religion which he professes" (clause 2).

Article 11 also lists the following rights of each religious group (its definition, however, is not given):

(a) To manage its own religious affairs.
(b) To establish and maintain institutions for religious or charitable purposes.
(c) To acquire and own property and hold and administer it in accordance with law.

It is remarkable that some provisions of Article 11 coincide with the similar part in the Constitution of India 1950.

Furthermore, Article 12 specifies that every religious group has "the right to establish and maintain institutions for the education of children in its own religion" without any discrimination. However, it shall be lawful for the Federation or a State to establish or maintain Islamic institutions or provide instruction in the religion of Islam and incur such expenditure as may be necessary for the purpose.

Then nobody shall be demanded "to receive instruction in or take part in any ceremony or act of worship of a religion other than his own (clauses 3 and 4)." Finally, the article has a remark concerning children: "For the purposes of Clause (3) the religion of a person under the age of 18 years shall be decided by his parent or guardian" (remarkable that in Singapore the legal age is 21).

Regarding political rights, the Malaysian Constitution guarantees the freedoms of expression, assembly and association (Article 10). However, the freedoms are not absolute; the same article contains a verbose clause, according to which Parliament may by law establish such restrictions on these rights "as it deems necessary or expedient in the interest of the security of the Federation or any part thereof, public order or morality."

Besides, restrictions on the right to freedom of speech and expression also can be imposed to protect "the privileges of Parliament or of any Legislative Assembly or against contempt of court, defamation or incitement to any offense." And the right to form associations may be restricted by any law relating to labor or education. A separate clause provides the possibility to limit the right of citizens to form associations by any law relating to labor or education (clause 3), while in the Constitution 1957, such provision was absent.

Finally, a next amendment (clause 4, Art. 10) that was entered into force on 10 March 1971 according to Act A30 asserts the right of Parliament to pass "law prohibiting the questioning of any matter, right, status, position, privilege, sovereignty or prerogative" set or protected in accordance with several other articles of the Constitution, if such questioning does not cover implementation of such prohibiting law. The mentioned articles relate to the citizenship issues, the constitutional status of the Malay language, and the special rights of Malays, as well as privileges of the Malay rulers. It is important that the indigenous peoples of Sabah and Sarawak have the same rights and privileges as Malays.

The adoption of Law A30 on the amendment to the Constitution was caused by historical reasons: in February 1971, the state of emergency was lifted in Malaysia, and the Parliament passed the respective law in order to stabilize the situation in the country. Since then, any amendments to the Constitution and legislation on the rights of ethnic minorities may be entered only with the consent of the Council of Rulers and subject to approval by both Houses of Parliament (two-thirds of the majority is required).

As is known, the further normal development of the Federation of Malaysia became possible largely owing to the consensus between the United Malays National Organization (UMNO) and the Malaysia Chinese Association (MCA)

which represented the interests of the largest ethnic groups of Malaysia.

In this regard, it seems to be appropriate to cite the following statement of M. Mironyuk: "The existence or aggravation of ethnic and national problems causes the formation of political parties based on ethnicity" (Mironyuk M.G., The Modern Federalism: Comparative Analysis (in Russian). (Moscow 2008), p. 117).

In the Constitution of Malaysia, citizenship issues are regulated mainly by Part III entitled "Citizenship" (it consists of three chapters, including 18 articles). It is important that Article 9 states that no citizen may be deported or expelled from the Federation.

One of the main factors of the ethnic conflict in Malaysia in the 1950s–1960s was citizenship issue. Previously, I considered the question in several articles (see, e.g., (2) and (3)), so I just present below some main points.

On 1 February 1948, the British government announced the creation of the Federation of Malaya, restoring the privileges of the Malay sultans and the special rights of Malays. Obtaining citizenship for non-Malays was restricted. Later, in order to ease the tension between the Malay and Chinese communities (as well as to reduce the influence of communist rebels on the Chinese community), British authorities amended the citizenship law which allowed about half of the Chinese population to become citizens of the Federation of Malaya.

In the independent Malaysia, bloody clashes occurred in 1969 between the left opposition and local government supporters in Perak, Penang, and Selangor. Then due to outbreaks of racial violence across the country (13 May incident and others), the government declared a state of emergency. In February 1971, the state of emergency was lifted and the Parliament passed a law to amend the constitution. The amendment prohibited public discussion of the issues concerning the constitutional status of the Malay language, citizenship, and special rights of Malays, while indigenous people of Sabah and Sarawak had acquired the same rights and privileges as Malays. The Constitution and legislation on the rights of ethnic groups can be amended only with the consent of the Council of Rulers and subject to approval of the Parliament.

Nevertheless, owing to the cooperation of governments of Malaysia and Singapore, their separation took place rather peacefully in 1965, but the both legislations give careful consideration to the issues of citizenship in order to ease and prevent tensions between the states. Eventually that contributed to the protection of the polyethnic rights in Malaysia and Singapore.

## Conclusion

In the analyzed constitutions, there is an increase of provisions on the human rights and freedoms, first of all due to the impact of international law and democratic processes.

Just as Malaysia, the current government of Indonesia which is often called technocratic relies on the development of science and technology, while preserving religious values and national unity has gradually stabilized the political and economic situation in the country that at the turn of the century was on the verge of disintegration and economic collapse.

These positive changes are manifested in the legislative sphere, first of all in the amendments to the Constitution of Indonesia, especially with regard to fundamental human rights and freedoms.

However, the Nusantara countries, in general, are characterized by inconsistency in constitutional provisions vis-à-vis the actual state governance. In a number of different cases, the system of rights and duties of citizens remains incomplete that often reveals itself in disregard of the constitutional rights and freedoms.

## Definition

A constitution is a combination of written and/or unwritten rules for the governance and administration of a particular society.

## Introduction

### Defining constitutional reform: brief overview

A constitution should be seen as a combination of written and/or unwritten rules for the governance and administration of a particular society. For this reason, such rules and administration are designed in the view of those responsible for devising them, by taking into account the social structure, aspirations, resources, and differences that exist between and among the groups that make up that society. In drawing up those rules, whether written or unwritten, the rule makers also attempt to adapt not only to changing social and economic conditions but also to future goals and visions. In this way a constitution must be perceived not as a "document for all times" but as a changing script, adapting to a changing environment. This is why most constitutional experiments or revisions tend to follow dramatic changes in the social and political order Francis (1985).

These rules must also enable the society to adapt to a changing domestic and multinational environment, accommodate their changing aspirations, deal with emergencies, and allow especially in a democracy for the maximum participation of its citizens in the process of government. How these rules come into being, how they are changed, and their differing degrees of entrenchment are thus critical questions for those who devise constitutions or reform them. What these rulers will be will depend on the nature of the social and political systems and the goals of the society and its rulers. In a communist system accordingly the rules will be different from those that will obtain in a democracy. In the case of the Caribbean, there is no doubt that the goals and strivings of rulers and its people were essentially democratic. They must then be judged by their contribution to the goals of democracy.

In the case of the Commonwealth Caribbean, it is important to recognize that most of the islands were under the rule of the British as a result of conquest, treaty, or annexation. What might be regarded as the constitution were in fact Orders in Council which established what was commonly referred to as Crown Colony government, established largely by the device of Orders in Council by the ruling colonial power, namely, the British. Colonial rule then ensured that the dominant institutions of the colony would be British. According to Spackman (1967) under this arrangement, the colony was rules by a Governor

appointed by the British who governed on the basis of an Executive and Legislative Council.

This would be the standard arrangement that obtained in countries such as Jamaica, Barbados, and Trinidad and in what was then British Guiana. The Executive was made up of officials with the Governor as Chairman to which was later added some elected members. The Legislative Council contained largely officials and nominated members to which were later also added some elected members on a limited suffrage. As one observer commented, it was a system of "three in one and one in three." The underlying philosophy of colonial rule was that colonial people were to be educated into self-government and the elected principle was gradually introduced until a number of intervening developments such as the First and Second World War, the economic depression of the 1930s, and returning activists led to the introduction of universal adult suffrage. This was followed by a period of tutelage through stages such as Chief Minister, premier until independence was achieved during the early 1960s. Independence came more reluctantly in the case of what was British Guiana but less so in the cases of Trinidad, Jamaica, and Barbados. Indeed in the case of Trinidad, the Prime Minister was urged to "hurry up," by visiting the Secretary of State (Mc Intosh 2002).

It is also important to recognize however that a constitution is a set of rules that locate and distribute power within a political system. It also determines whether the "winner takes all." It also identifies who is to make policy, whether the system will be presidential, semi-presidential, or parliamentary; it can also determine which kinds of parties will survive or whether the elections are direct or indirect. It can also determine what the relationship between the Head of State and Head of Government will be. Some are more concerned with the extent to which the constitution is conducive to democratic processes. Yet others are concerned with problems such as maintaining priorities, coordinating conflicting objectives, and achieving policy goals. Yet others are concerned with the nature of effectiveness of checks and balances as well as veto points. Some concern has also been expressed over the ability to select or dismiss Executives or promote regime stability and predictable policy in a context of social instability. Experience would reveal that some expectations could be disappointed or that some outcomes could be contradictory.

Yet all constitutional arrangements do have some basic issues to address. These would include areas such as representation, administration, legislation, and adjudication; admittedly these are broad categorizations, and within each of them, there will certainly emerge a number of questions that will need specific resolution. Much of these requirements derive from the fact that constitutional history, culture, and experience of the British Caribbean were shaped by what was obtained at the time. Yet what was bequeathed to the Caribbean was very much an adaptation to the local environment thus leading to a label as a Westminster-Whitehall model.

The run-up to independence in the Caribbean was not in fact encouraging. In Jamaica following the disturbances of the 1930s, Norman Manley warned that there was a danger that the country might become ungovernable, while in Trinidad ethnic tensions between the two major ethnic groups had become so severe that states of emergency had to be declared. Yet it was clear that the British approach to constructing a new constitution for independence was largely a "one-size-fits-all" approach and one that was largely dictated by the experience of what was then the Gold Coast.

There was also the emergence of the Cold War and the clear ideological preferences of Dr. Cheddi Jagan, the leader of British Guiana, factors which had led Dr. Eric Williams to declare that he was "best of the iron curtain." Cumulatively then domestic as well international development was to ensure that the independence constructions were to be holding operations. In Trinidad there were public discussions on the form that the independence institutions should take although the constitutional advisers to the government pointed out that they were concerned to follow well-trodden paths; in the case of Jamaica, there were no such consultations, while in British Guiana the constitution had been suspended in 1953.

Not surprisingly there was much similarity between the constitutions of the various territories except in the case of British Guiana. In the rest of

the Caribbean, there was to be a Governor as the representative of the Queen, a Premier elected by Parliament, an Executive responsible to it, independent Commissions in relation to the Public Services, the Police, the Judiciary, the Teaching Service, provisions for local government, entrenched clauses, elections at regular intervals, and dual chambers along with smooth transitions from one regime to another. The Governor was to consult with and act on the advice of the Prime Minister, and the Prime Minister was to be appointed on the basis of the judgment of the Governor as to who could best command the majority of members in the House or in the case of the Opposition Leader, the person who could command a majority of those opposed to the government. No specific procedure was established; however, that was to be followed in this regard. Jamaica was however allowed the device of a referendum (Spackman 1967).

By and large in the case of Jamaica, the constitutional arrangements of 1962 seemed to have worked so far. There have been amendments in relation to the Service Commissions and their transformation into agencies along the lines of the United Kingdom as well as a Charter of Rights and Freedoms. There have also since been calls for a change from a monarchical to a presidential system of government. What divides the advocates of presidentialism however is the question of the powers to be assigned to the President and the manner of his election, since the Senate is also constructed on party lines. The examples of Latin American dictatorships and their equation with presidents have been cited. It must be recognized though that Jamaica is largely African descended and its divisions are largely along "class" lines, although popular jargon refers to the plight of the "black man."

Some reservations have also been expressed over the decision to include judicial review on matters such as the exercise of some powers by the Governor-General or his deputy, whether the speaker's certificate is valid, whether an order on the delineation of boundaries is valid, or whether a Service Commission has validly performed its function. In Trinidad also unlike Jamaica, there is no provision for referendum, and its senate contains a provision for independent senators. There are also special clauses requiring differing majorities for their amendment (Kelly 1963).

By 1958 however, most countries in the Caribbean-British Guiana excepted, opted to form a federation, the better to achieve independence in their own territories. When, however, the Jamaican government was advised in 1959 that it possessed all the criteria for independence on its own, it decided to call a referendum in 1961, which ended in the eventual collapse of the Federation. In the graphic language of Dr. Eric Williams, the then Premier of Trinidad and Tobago, one from ten left nought. In desperation, Arthur Lewis, a future Nobel Prize winner, campaigned for a smaller federation of The Eight. It was rejected and Trinidad proceeded somewhat strangely to offer unitary statehood to Grenada. Trinidad had also moved from quasi-ministerial government in 1950 and into cabinet government in 1957 so that it had indeed followed the path to independence set out by British Colonial Policy.

In Trinidad also the relationship between the governing party and the opposition since independence has been uneasy largely because the latter had been rent by internal dissension with little prospect of capturing political power. Indeed in the election of 1966 after independence revealed a dramatic decline in support for both major parties. Four years later in, 1970, there was an outbreak of "Black Power" disturbances that shook the government to its very foundations. In the election of 1971, the ruling party captured all the seats and a constitutional crisis ensued. This was followed by the appointment of a constitution commission in 1974, to review the workings of the constitution since independence. While it is true that some of the grievances were imputed from the civil rights movement in the United States and the experiences of Trinidadians at a Canadian University, there could be no doubt that some were locally inspired problems such as unemployment, the failure of opposition parties, and what was perceived as the excessive power of the Prime Minister.

Spackman has pointed out that changes had been recommended in 1957, for the conventions

of Cabinet government in 1958 and also that the number of Cabinet Ministers be increased to include a Minister of Home Affairs with responsibility for security and the police and immigration which came together by another Orders in Council which introduced internal self-government. In many ways this merely ratified what was in practice Cabinet government since 1956. The recommendations of the Wooding Commission that followed were undoubtedly extensive, but the extent to which they represented the people is another question. The commission also expressed concern over the extent of the patronage by the Prime Minister, his power to appoint the Chief Justice and members of the Judicial and Legal Service Commission, the Chairman, and other members of the Service Commissions as well as the Chairman of the Boundaries Commission.

It accordingly recommended that their powers should be removed from the Prime Minister and be vested in a President after consultations with the Prime Minister and the Leader of the Opposition. The commission also recommended a limited amount of proportional representation, election of its President by an Electoral College, changes in fundamental rights, citizenship, and in the function and position of the Attorney General as well as the introduction of Standing Committees to scrutinize certain categories of bills. Most of the recommendations found their way into the constitution of 1976. The notable exception was the recommendation of proportional representation. What the 1976 constitution did also was not to disperse but to relocate what was perceived as the considerable power of the Prime Minister into the office of the President.

The constitutional motions of 1978 as well as the Acts of 1999, 2000, and 2001 amending the constitution were understandable outcomes of earlier reservations and difficulties. These measures allowed judicial review over the Service Commission and access to information on governmental policy-making along with the Ombudsman, the Integrity in Public Life Act of 1987 and the Equal Opportunity Act of 2000. It seems though that there is not much public comfort in the working and record of the Integrity Commission, while allegations of corruption are as widespread today as they were in 1956. Today, also the concerns are about the powers of the President, the role of the Director of Public Prosecution and the Judicial Systems, as well as the relations between the D.P.P and the Attorney General.

British Guiana notwithstanding the suspension of the constitution in 1953 as well as the existing racial anxieties and insecurities of the period achieved self-governing status in 1961 under the umbrella of a Governor and elected Premier chosen from a first-past-the-post elected chamber but with an electoral system that produced disparities between votes received and seats obtained. In 1964 a system of proportional representation was introduced that produced coalition government. Independence came in 1966. Thereafter Burnham, the Prime Minister declared the state a consultative democracy and embarked in 1969 and after on a wave of nationalization.

A cooperative republic on route to socialism was declared in 1970 that was later transformed into an Executive President with a veto under the doctrine of "Para mounting of the party" and in 1980 a Council of the National Congress of Democratic lagans. A crucial factor in the directive principles of the state was proclaimed as socialism, while the later amendments to the constitution had of course been due to the racial imbalances in the society. With a history of ethnic voting, it was to be expected that under the first-past-the-post system the African segment would be in perpetual opposition. It was not surprising then that a system of regional elections was introduced to supplement that of the Legislative Assembly. Some of the more important laws included the Representation of the People Act (1964) and the National Registration Act (1967) dealing with electoral polls.

Under the Herdmanston Accord, it was agreed that there should be some degree of gender and geographic representation in the legislative process. Fifty-three members were directly elected to Assembly and the remainder indirectly. Under the Amendment Act No. 3 of 2000 and the Election Laws (Amendment) Act No. 15 of 2000 and in November 2000, all members of the National

Assembly were to be directly elected with 25 members from the ten geographic constituencies and the remaining 40 to be determined by a top up list to ensure a high degree of proportionality.

A party fielding candidates for the National Assembly was required to nominate persons in at least 6 of the geographic constituencies or for 14 of the 25 constituency seats. One third had to be women. By further amendment in February 2001, the National Assembly was allowed to have at least 65 members and to allow the Election Commission to award "overhead seats," if a party won a disproportional number of constituency seats. The result of these and earlier reforms has been to lessen the racial appeals at national level and the emergence of validation arrangement and accommodative positions. What is clear is that constitutional reform in Guyana has largely been a response to an ethnic structure as well as the interaction between domestic and international considerations.

The case of Barbados has been unique in many ways since it enjoyed a large measure of self-government since 1640. Yet, it too received its independence only in 1966 on the basis of the model that was largely used in the case of the other territories. Thus, the Prime Minister is appointed from the majority party in the legislative chamber with a Governor-General as Head of State. In 2012 a commission was established to consider constitutional reform. There have been few amendments to the Barbadian Constitution over the years, but in recent times there have been calls for reforms that would conform to what is described as its political identity.

## Conclusion

Constitutional reform in the Caribbean then has largely been an exercise in the transference of power from the colonial to local rulers. It was essentially a change from dependence to independence for the states involved. Following a failed federation in 1961, they all proceeded to independence. Most of the provisions of the independence constitutions endured, but in the cases of Trinidad and Guyana, there were radical changes from parliamentarianism to presidentialism in Guyana in 1970 and 1976 in the case of Trinidad. Both countries also have race relations commissions. The constitutional changes in Trinidad and Guyana are to be explained by the existence of two substantial ethnic groups, namely, African and Indian whose relations over the years were perceived as uneasy and competitive. For these reasons, proposals for coalition, proportional representation, and presidential government have been more prominent in these two territories.

It also explains the lukewarm response of Trinidad and Guyana to the proposal for the abolition of the Privy Council and for federal initiatives. There have also been calls for reform of the regional constitutions to make them more attuned to our political identity and for removal of the Queen as Head of State and change in the system to make it more autochthonous. Yet it must be recognized that a constitution is a set of rules that allows a people and a state to develop and adapt to a changing world. West Indians are the products of empires and the children of migrations from other continents. The footprints of the original people are still around. How to integrate these various ingredients into a constitution and to avoid reinventing the wheel will be the challenge of future constitution reformers.

# Constitutional Rights of Public Employees

Beth Cate
School of Public and Environmental Affairs, Indiana University, Bloomington, IN, USA

## Synonyms

Civil rights; Constitutional law; Public personnel management

## Definition

Constitutional rights of public employees refer to limits that a constitution (as the supreme law governing the actions of public personnel) places on how and why government employers may discipline or fire their employees.

## Introduction

Constitutions are fundamental charters for governance; they set out the powers that government institutions may exercise and the limits on those powers. Accordingly, when the government acts in its sovereign capacity to regulate the populace, it must do so in a manner that does not conflict with applicable constitutional provisions. This means that constitutional provisions – as interpreted by courts, which must apply broad constitutional language to specific disputes – necessarily limit the policy and administrative choices available to public administrators to pursue the public interest. Among the most important constitutional provisions imposing such limits are protections for certain individual rights that are considered so fundamental to personal and collective freedom that the constitution shields them substantially – though certainly not entirely – from government interference.

For example, the First Amendment to the United States Constitution prohibits the national legislature – and by judicial interpretation, the national executive as well as state and local governments – from making laws "abridging the freedom of speech." Courts have held that this prohibition invalidates essentially all government regulation of private speech that targets the speaker's viewpoint (for example, restricting speech that opposes immigration but allowing speech that favors it) and most regulation targeting speech on specific topics (such as banning discussion of immigration policy). They conclude that such regulations improperly restrict the open inquiry and debate that the First Amendment protects in order to allow the people to hold government accountable and engage in meaningful, well-informed self-governance.

What about when government acts not as a *sovereign* regulating citizen speech on a controversial matter – say, by imposing buffer zones for protests at abortion clinics – but as an *employer* wanting to restrict its workforce from blogging their personal views of the buffer zones? Do constitutions constrain how governments manage public employees? In America the answer is yes, but this is a relatively recent development. For most of America's history, government jobs were forms of patronage, granted and revoked based on reputation, family background, education, or (as the strength of political parties increased in the early nineteenth century) political sympathies and loyalties (Meier 558). Accordingly, the government *as employer* could constitutionally discharge its workers on grounds, and in ways, the government *as sovereign* could not use to punish citizens in similar circumstances. Public employees were deemed to have abandoned any constitutional rights they held as citizens when they joined the government workplace. The future US Supreme Court Justice Oliver Wendell Holmes Jr. summed up this state of affairs in a Massachusetts Supreme Court case upholding a policeman's termination for engaging in political activities contrary to city regulations: "The petitioner may have a constitutional right to talk politics, but he has no constitutional right to be a policeman. There are few employments for hire in which the servant does not agree to suspend his constitutional right of free speech, as well as of idleness, by the implied terms of his contract.

The servant cannot complain, as he takes the employment on the terms which are offered him" (McAuliffe v. Mayor & Aldermen of New Bedford, 517–518).

Supporters of a patronage approach to government jobs argue that it keeps public administration responsive to the electorate's chosen leaders and policies, and they contend that this value outweighs the enhanced administrative competence that might come from merit-based appointments (Meier, 559). Nevertheless, Congress and state legislatures converted most public hiring and retention schemes from at will to merit based in the late nineteenth and early twentieth centuries. This legislative effort eased the way for courts to step in and impose additional constitutional limits on public workplace management. Some of these tracked doctrinal developments in constitutional rights for the public at large. For example, as public reliance on government benefits, resources, contracts, licenses, and jobs expanded significantly in the twentieth century, courts began to recast them not as largesse but as "new property." This meant that the government could not withdraw them arbitrarily, take them without due process of law, or condition them on relinquishing constitutional rights (Reich, 741–746). Other developments more specifically involved public employment, such as Cold War era rulings that the government could not condition teaching and other public jobs on swearing a loyalty oath, or withhold them from members of communist or other "subversive" organizations.

Courts from the 1960s onward have justified recognizing constitutional rights in the public workplace partly on the strength of the individual liberties at stake. They have rejected Justice Holmes' earlier formulation in favor of the view that "[t]here are some rights and freedoms so fundamental to liberty that they cannot be bargained away in a contract for public employment" (Connick v. Myers, 147). Courts also have emphasized that protecting such rights generally promotes public administration that is transparent, accountable, non-arbitrary, fundamentally fair, and characterized by the rule of law.

But public administration can pay a significant price for these benefits, by reducing the control over workers that is generally needed to get things done timely and well and consistent with priorities set by elected officials. Internal proceedings and lawsuits to resolve constitutional claims impose substantial costs, divert resources and personnel from public duties, and may deter some talented individuals from joining agency ranks (Harlow v. Fitzgerald, 816). Judicial rebuke of public management decisions on federal constitutional grounds implicates potent separation of powers and federalism concerns. Consequently, some jurists argue against "constitutionalizing" government personnel management and urge that legislation, such as ethics and whistleblower laws and nondiscrimination statutes, strikes the appropriate, voter sanctioned balance between protecting public workers and not imposing undue costs and inefficiencies on governmental operations (Bd. of Cty. Comm'rs v. Umbehr, 692–695).

So far American courts have resisted these claims and continue to strike the balance at a constitutional level, requiring government employers to justify treating employees differently from members of the public on the grounds that to do otherwise would unduly disrupt or burden public administration. David Rosenbloom offers a "public service model" that summarizes the chief factors courts weigh to strike the right balance in a given case: "(1) the employee's interest in exercising his or her constitutional rights...; (2) the government's interest in achieving some important purpose as an employer; (3) the public's interest in the way government and public administration operate; and (4) avoidance of overly intrusive judicial involvement in public management" (Rosenbloom, 48). Courts tend to give substantial weight to the second and fourth factors, emphasizing that "[t]he government's interest in achieving its goals as effectively and efficiently as possible is elevated from a relatively subordinate interest when it acts as sovereign to a significant one when it acts as employer" (Waters v. Churchill, 675). As discussed below, however, blending the considerations Rosenbloom cites to resolve an employee's constitutional claim involves fact-intensive analysis and multi-part doctrinal rules and therefore produces few

predictable outcomes. This unpredictability helps protect public officials from personal liability for violating public employees' constitutional rights, since to be liable they must violate clearly established constitutional rights that they knew of or reasonably should have known of. Whether the unpredictability emboldens or discourages constitutional claims by public employees as a general matter, and imposes more or fewer costs on government employers as a result, is unclear.

In describing the major constitutional rights accorded to public employees in the United States, this entry focuses on the judicial interpretation of provisions in the United States (i.e. national or federal) Constitution's Bill of Rights, (the colloquial term for the first ten amendments to the Constitution, and the Fourteenth Amendment, which says that states may not deprive someone of life, liberty, or property without due process of law and may not deny someone equal protection of law. The US Supreme Court has required state and local governments, as sovereigns and employers, to respect most individual rights granted by the federal Bill of Rights, holding that those rights are "incorporated" into the Fourteenth Amendment's due process guarantee. Focusing on the federal constitution therefore describes most constitutional rights enjoyed by federal, state, and local workers. It is beyond the scope of this entry to consider additional protections that may be afforded state and local workers by the constitutions of their respective states, or by public workers generally under federal, state, and local legislation.

## Public Employees' Constitutional Rights: Scope and Limits

### Freedom of Speech and Assembly and the Right to Petition for Redress of Grievances

The constitutional right most litigated between public workers and their employers is the right to freedom of speech under the First Amendment. Since the 1960s, the Supreme Court has asserted that "citizens do not surrender their First Amendment rights by accepting public employment" (Lane v. Franks, 319). Free expression of ideas and facts, without coercion or the imposition of orthodoxy by the government, is considered critical to informed debate and to meaningful public oversight of policymaking and administration. For this reason, and because public employees frequently will have well-informed opinions on government actions by virtue of their work experience, courts have limited the government's ability to punish employees – even probationary employees who may otherwise be terminated for no reason at all – for joining the public debate. Accordingly, when a public employee is speaking as a citizen on a matter of public concern, her employer may only restrict or punish that speech if it is reasonably likely to substantially interfere with workplace operations and the provision of public services.

Unpacking this rule further, courts have said that to speak as a citizen, an employee's speech must not be part of her official duties, based on the substance of her job as performed and not by a written job description. The theory underlying this requirement is that the government should be able to control speech that it has created or commissioned (Garcetti, 421–422). Rejecting the notion that all goings-on within government bodies are by definition matters of public interest, courts also require a public employee to prove that her speech, when judged by its form, content, and context, addressed an issue of concern to the community or of legitimate news interest, and not a private grievance (Connick, 147–148).

After crossing these thresholds, the employee must show that her speech – or, what the employer thought she said – was a substantial or motivating factor in taking adverse employment action against her; however, an employer that disciplines an employee for her protected speech may still avoid liability by showing that, more likely than not, it would have taken the same action against her for other valid reasons in the absence of her speech (Mt. Healthy, 287). Finally, the employee must prove that her interests in speaking, and society's in hearing from someone well informed through their work experience, outweigh those of her employer in "promoting the efficiency of the public services it performs through its employees"

(Pickering, 568). The factors that courts find relevant in this "Pickering balance" are whether the speech did or is reasonably likely to create disharmony among coworkers or undermine morale in the workplace, lessen trust (or actively breed distrust) between colleagues, or between supervisors and employees where close working relationships and trust is essential or interfere with the employee's ability to fulfill his official duties.

This same set of queries applies to public employee claims invoking freedom of speech, the right to peaceably assemble, or the right to petition government for redress of grievances. Each case involves close scrutiny of facts and difficult line drawing by courts, producing many divided decisions. Whether the overall outcome is to narrow protections for public employees is unclear. On the one hand, courts have set a high bar for preserving any remaining patronage-based appointments, requiring the government to demonstrate that shared party affiliation or political views are reasonably required for effective performance of the job in question (often focusing on the confidential or policymaking aspects of such work), and rejecting the government's claims in most such cases. Courts also have said that purely internal communications to colleagues and supervisors may qualify as touching on matters of public concern; examples include an assistant district attorney's survey question to coworkers about pressure to support political campaigns and an office worker's remark after a presidential assassination attempt that she hoped they would get him next time. The Supreme Court also has suggested that the ban on protection for speech created as part of official duties may not apply to teaching and writing by public university professors, who are paid precisely to contribute to the public debate, and has noted an independent duty all citizens have to testify truthfully under oath, which may protect the testimony of a public employee whose job includes going to court on behalf of a government employer (Garcetti, 425; Lane, 325).

On the other hand, lower courts have held that speech in the context of a professor's administrative service is part of employment duties and unprotected and have left open whether protection exists for sworn testimony by public employees whose job involves going to court on their employers' behalf. And, while courts have said that concerns expressed internally to colleagues or supervisors are not categorically beyond First Amendment protection, several cases have cited the internal nature of communications in finding them to be part of official duties and thus unprotected. Public communications, such as letters to the local newspaper or complaints to external auditors and regulatory authorities, are more likely to be deemed to touch on matters of public concern. This may incentivize employees to air concerns publicly, which in turn may disrupt government service substantially and in some cases give the employer a stronger hand in the ultimate balancing of interests.

Further, in an effort to reduce burdens and judicial intrusion on public workplace management, an employer may terminate an employee on a reasonable, but mistaken, belief that her speech was unprotected. However, if an employer mistakenly believes an employee engaged in protected speech and punishes her for it, the employer will be liable, on the grounds that such discipline chills others from engaging in protected speech even if the disciplined employee did not actually exercise her rights (Waters, 669; Heffernan, 1418). Employers need only reasonably anticipate substantial disruption to the workplace from an employee's speech – they need not wait to react only after disruption occurs (Connick, 152). Wary of micromanaging the public workplace from the bench, courts have tended in recent years to give significant credit to employer concerns that employee speech will undermine harmony and trust among coworkers, legitimate supervisory authority, and public confidence in the agency.

Freedom of speech includes the freedom not to speak and not to associate with others whose message one declines to join. For public employees, this has meant the right to refuse to join a public union, and in recent years, membership in public unions has declined significantly. The Supreme Court has long held that the First Amendment bars public unions from demanding fees from nonmembers to support lobbying and other political activities, but has also held that in

the interest of avoiding free riders, the unions may act as "agency shops" and collect fees from nonmembers for negotiation, contract administration, internal grievance procedures, and certain efforts to influence policymaking that the Court has deemed nonpolitical and that benefit all workers (e.g., on issues of wages and benefits). Under a "right to work" banner, advocates for nonmembers have persuaded a number of state legislatures to eliminate the laws authorizing agency shops. Several states retain the agency shop approach, however, and so challengers continue to attack its constitutionality. The Supreme Court seemed poised to overturn its earlier rulings and invalidate agency shops, but with the death of one of the nine Justices in February 2016, the Court is evenly split on the issue currently, and so future First Amendment challenges are likely to await a full bench.

### Substantive and Procedural Due Process of Law

The Fifth and Fourteenth Amendments say that the federal and state (including local) governments, respectively, may not deprive someone of "life, liberty, or property, without due process of law." Due process of law contains both substantive and procedural components relevant to public employment, although many more claims have involved the latter. Government denies its employees substantive due process when it interferes with fundamental liberties without sufficient justification. Most fundamental liberties (like free speech) are spelled out in the Constitution, and employees must cite those provisions rather than substantive due process where they apply. The few cases in which public employees successfully sued on substantive due process grounds have involved the enforcement of mandatory leave policies for pregnant women still capable of working; this reflects the Supreme Court's view that making decisions on matters of family and procreation is a fundamental individual liberty that is implied rather than expressly stated within the Constitution. The Court has strenuously rejected the notion that public employees may use the substantive due process clause as a catch-all tool to challenge individual employment decisions: "We must accept the harsh fact that numerous individual mistakes are inevitable in the day-to-day administration of our affairs. . ..The Due Process Clause of the Fourteenth Amendment is not a guarantee against incorrect or ill-advised personnel decisions" (Bishop, 349–350).

Government denies an employee procedural due process when it takes away her property – in this context, takes away her right to continued public employment by terminating, suspending, or demoting her – through a process that is not fundamentally fair. The Due Process Clause does not itself grant a right to continued employment; instead, the employee must point to a statute, contract, or well-established practice that creates such a right, for example by requiring a finding of "good cause" for termination. If such a right does not exist – if the employee is probationary or at will – then the Due Process Clause imposes no constitutional constraints on the process used to terminate her, even if statutes or contracts require certain procedural steps. If a public employee does have a right to continued employment, her employer may not discharge, suspend, or demote her without offering her a hearing before an impartial decision-maker (which may be an agency official), in which she receives notice of the reasons for discharge and an opportunity to review and respond to the employer's charges and evidence. Recognizing the employer's need to respond quickly to employment concerns, courts have held that pre-termination hearings, which are designed to clarify facts and avoid errors, may be brief and informal, especially if full evidentiary hearings are provided post-termination. Generally the remedy for violating an employee's procedural due process right is procedural rather than substantive – a new hearing, rather than reinstatement. Employees have no constitutional right to appeal the outcome of the hearing and may waive their right to the hearing itself.

Procedural due process also prohibits government employers from interfering with the liberty interest of all employees – including those without a right to continued government employment – in being able to work and earn a living. If, in the course of terminating an employee, a government employer publicly disseminates information that the employee claims is false, stigmatizing and

likely to substantially impair her future employment, the employee may assert a procedural due process right to a "name-clearing hearing." The purpose of such a hearing is solely to allow the employee to clear her good name and reputation; it is not an appeal of her termination and does not permit reinstatement, even if she proves that information the employer shared about her is false. Charges of dishonesty, embezzlement, drug and alcohol addiction, sexual misconduct, and mental instability all have qualified as sufficiently stigmatizing to warrant name-clearing hearings. Whether the employer has made the charges sufficiently public to warrant a hearing is determined on a case by case basis; sharing the charges with a potential future employer during a background check likely would qualify. The disclosure must be made by the employer and not coworkers or the media, to invoke the right to a name-clearing hearing.

### Equal Protection

The Fifth and Fourteenth Amendments require that government not deny any person equal protection of the laws. For public employees, this means that they have a constitutional right to be treated by their employers in the same manner as others who are similarly situated. The Supreme Court has held that a public employee may not use the Equal Protection Clause to challenge an employment decision that singles her out as a "class of one" for purely arbitrary, vindictive, or personal reasons; otherwise, too many public personnel management decisions would be constitutionalized and judicially micromanaged. But, when an employer classifies employees on different bases, courts will demand greater or lesser justification for those distinctions depending on the type of classification used.

Applying what is known as "rational basis scrutiny," courts will uphold most distinctions (e.g., age, residency, education, and work experience) as constitutional if they are rationally related to a legitimate government interest. Distinctions involving characteristics that are considered immutable, irrelevant to most or all work abilities, and historically misused to inflict great harm on minorities, require greater justification and more limited use. Accordingly, classifications based on race, ethnicity (as distinct from immigration status), and religion must be narrowly tailored to serve a compelling interest. In very few cases will an employer meet this burden; even so-called "benign" uses of race have been rejected, if intended as general affirmative action or workforce diversity measures (although race may be used in a limited way to address specific past instances of segregation). Rosenbloom suggests that undercover police or counterterrorism work requiring an agent to match the characteristics of an infiltrated group might withstand strict scrutiny (Rosenbloom, 52).

Historically, gender-based classifications have received "intermediate" scrutiny, requiring that the employer show the classification is substantially related to an important government interest. This reflects the (now diminishing) sense that certain innate differences between men and women warrant differential treatment in the workplace. Courts have differed as to whether classifications based on sexual orientation (and perhaps gender identity) also warrant intermediate scrutiny. Notably, federal and state statutes offer extensive nondiscrimination protections for age, disability, veteran status, and in some cases sexual orientation and gender identity, that go well beyond constitutional protections and give public employees a firmer footing for their claims.

### Privacy

The Fourth Amendment states that "[t]he right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated . . . ." Courts have interpreted the Fourth Amendment to mean that whenever someone has an objectively reasonable expectation of privacy (i.e., an expectation of privacy that society generally shares) in a place, or thing, or her person, the government may not invade that privacy without either obtaining a warrant – a judicial order authorizing the search or seizure, the "gold standard" of privacy protection since it involves oversight by a separate branch of government – or demonstrating that getting a warrant is not feasible and the search is otherwise reasonable in the circumstances.

The right to be free from unreasonable searches and seizures extends beyond criminal investigations and protects public employees from unwarranted invasions of privacy by their government employers in the course of their work. At the same time, courts have recognized that public, no less than private, employers have "special needs" to search or access employee possessions and information in order to carry out valid workplace functions. Accordingly, public employers do not need a warrant to conduct searches for non-investigatory, work-related purposes or to investigate work-related misconduct. Searches will be considered reasonable, and therefore constitutional, if they are justified at their inception, use methods reasonably related to what the employer is seeking, and are not excessively intrusive in the circumstances. So, for example, a city police department did not violate an officer's constitutional rights by reviewing two months of pager message transcripts to determine whether the city needed to adjust the character limit on department-issued pagers, after an officer exceeded that limit several times; the city disciplined the officer after finding that most messages sent and received by his pager were non-work related and many were sexually explicit (City of Ontario, 762–765).

In judging the overall reasonableness of a workplace search, or whether a public employee has a reasonable expectation of privacy to begin with – without it, no search is deemed to occur and the Fourth Amendment is not implicated – courts will consider the "operational realities" of the public workplace. These include whether an employee's files are publicly available under freedom of information laws, or her communications subject to monitoring or audit under employer policies, or her workspace open to public traffic. Public employers may effectively set expectations of privacy through their policies and thereby make workplace searches easier or harder to conduct. The digital age may present certain challenges, however, as when employees use personal devices for workplace communications. In a very small number of cases involving employees in dangerous and highly regulated work (drug interdiction, railroad operation), the Supreme Court found such a reduced expectation of privacy and an elevated employer need that suspicionless drug and alcohol tests were constitutional; more commonly, investigatory searches for workplace misconduct involve individualized suspicion.

C

### Free Exercise of Religion/Freedom from Establishment of Religion

The First Amendment protects both an individual right to free exercise of religion and a right to be free from government establishment of religion. Accordingly, public employers may not coerce employees, overtly or subtly, into joining in prayer or other religious activities in the workplace. More difficult questions arise as to how far employers must and may go in accommodating employee religious expression in the workplace. For example, some employees may wish to wear or display articles in the workplace that reflect or express their religion, or to discuss their religious beliefs with coworkers and clients. Employers may fear that employee religious expression will be attributed to the employer and prompt claims that the employer has violated the Establishment Clause; or, they may be concerned that such activities will generate conflict with coworkers and clients, especially if religious expression takes the form of proselytizing.

Because many cases involving religious expression are brought under both the free speech and free exercise clauses of the First Amendment, courts have tended to apply the same balancing of interests described above. In the religion context, this means weighing the employee's interest in expressing her religious views against the employer's interest in promoting an efficient and effective workplace, avoiding substantial disruption to its operations, and avoiding Establishment Clause problems. Courts have lowered the bar for employers in this regard by holding that as a constitutional matter, they may apply neutral (i.e., not targeting religion), generally applicable workplace rules even if they substantially burden an employee's free exercise of religion, so long as the rules are rational and non-arbitrary. This approach reflects a major shift from earlier case law requiring government employers to show a

compelling interest in applying rules that substantially burdened an employee's religious rights. Congress and many state legislatures have imposed this stricter standard via statute, however, and so public employees commonly invoke those statutes alongside the Free Exercise Clause in an effort to gain broader accommodation of religious expression in the workplace.

### Public Contractors

In important respects, the Constitution shapes relationships with public contractors as well as public employees. Under the First Amendment, public contracts may not be conditioned on political support or withheld when contractors criticize government officials or policies. The scrutiny given to even benign racial and ethnic classifications and to gender classifications under the Equal Protection Clause has eliminated most minority and gender preferences in public contracting, leaving room only to remedy prior systematic exclusion from contracting opportunities. Excluding religious organizations per se from competing on equal terms for public contract and grant dollars violates their Free Exercise rights, although allowing them to use public funds to only hire those of the same faith and deliver only those services that are compatible with their religious views may violate the Establishment Clause. Finally, in certain cases where contractors are performing inherently public functions, are clothed by the government with its own authority, or operate jointly with the government, the contractors may be deemed "state actors" whose operations must comply with the Constitution.

### Enforcement of Constitutional Rights

Constitutional rights, like any rights, matter little unless they are enforceable. Depending on the right and violation at issue, employees may want injunctive relief (e.g., reinstatement to a position following unlawful termination, elimination of an unconstitutional workplace rule, redoing a procedurally defective disciplinary hearing); money damages to compensate for lost pay or other actual financial harms; attorney fees and other litigation costs; and punitive damages to deter future misconduct. Because governments traditionally enjoy sovereign immunity – immunity from being sued without their consent – public employees may only seek these remedies from the agencies employing them, or personnel within those agencies, if that immunity has been waived.

Waivers typically occur through legislation, where elected representatives can balance the desire to remedy harms caused by government action with the need to prevent litigation from bleeding dry the public fisc or discouraging talented individuals from entering public service and vigorously pursuing their duties. The civil rights statutes noted in this entry are examples of such waivers, as are federal and state statutes that permit suits for breach of contract by government agencies and for "torts" – harms to persons or property – committed by public employees in the scope of their official duties.

For public employees seeking to vindicate federal *constitutional* rights, the most important statutory waiver of immunity is a federal civil rights law, 42 U.S.C. §1983 ("Section 1983"), passed by Congress in 1871 under powers granted by the Fourteenth Amendment to safeguard the rights of newly freed slaves. Section 1983 states that every person who violates someone's constitutional rights while acting "under color of" state law is liable for money damages and other remedies including attorney fees. Section 1983 does not create substantive rights; it is a vehicle for public employees to argue that their constitutional (or federal statutory) rights have been violated, and they must prove that violation under the standards discussed in this entry.

While states and state agencies are not themselves considered "persons" under Section 1983, public officials acting in the course of their official duties are, and suits brought against them under Section 1983 are effectively suits against the government employers they represent. (Section 1983 subsumes, in practice, a century-old waiver created by the Supreme Court in a case called Ex Parte Young, allowing suit against state officials seeking them to be ordered to enforce federal rights.)

Unlike states, local government bodies may be sued as "persons" under Section 1983, but only for constitutional harms caused by official policies, customs or practices, or individual actions approved by a final policymaker. State and local employees may be sued in their individual capacities under Section 1983 as well. Section 1983 does not apply to the federal government, and no other statutory waiver exists authorizing constitutional claims against federal agencies or officials. In 1971, however, the Supreme Court held that the Constitution itself implied the availability of such a suit – in that case, a $15,000 damages claim against six narcotics agents for unconstitutional search and seizure – where the legislature had created no other remedy for such a violation. Called a "Bivens" action after the title of that case, the Court has only allowed two other such actions since 1971, reflecting its concern about usurping the legislature's role in waiving immunity and exposing the government to liability.

Federal, state, and local personnel (and contractors qualifying as state actors) may only be held personally liable for violating constitutional rights and required to pay damages out of their personal funds, if they violate "clearly established statutory or constitutional rights of which a reasonable person would have known." (Harlow, 818) This "qualified immunity" is an immunity not just from liability but from suit, so courts judge at the outset whether immunity is available and, if so, dismiss the case. Qualified immunity helps ensure that public workers have fair notice that their behavior is unconstitutional before penalizing them personally and helps give them the "breathing room" to make difficult decisions on the job without undue risk of liability. Because so many constitutional cases are decided through ad hoc balancing tests and fact-intensive analyses, the law rarely will be "clearly established," which greatly limits in practice the personal liability of public workers. Moreover, even when remedies may be available, litigating against one's employer or coworker(s) requires time, emotional energy, and money, which themselves can be potent deterrents to lawsuits and encourage early settlement of claims.

## Conclusion

Federal courts began recognizing constitutional rights of public employees roughly 60 years ago. This effort has eliminated most vestiges of political patronage as the basis for public jobs, while preserving space for a few positions that truly require partisan alignment. But the scope of employee constitutional rights remains limited, because courts are keenly aware of the needs of public as well as private employers to manage the workplace efficiently and effectively. Despite some notable constitutional victories for employees (and contractors), mainly rejecting egregious efforts to suppress legitimate criticism or whistleblowing by subordinates, courts are reluctant to convert most public personnel decisions into constitutional litigation. Statutory rights in many cases may offer more valuable protections for employees facing discrimination, invasions of privacy, or retaliation for speech and religious expression.

# Construct Validity in Public Policy Research

Patrick O. Asingo
Department of Political Science & Public Administration, University of Nairobi, Nairobi, Kenya

## Synonyms

Constructs; Policy research; Reliability; Validity

## Definition

Construct validity is the degree to which research constructs accurately reflect or measure the phenomenon they represent.

## Introduction: Concepts, Constructs, and Variables

A discussion on *construct validity* must inevitably begin by clearing the dense conceptual forest around it. A *construct* is a type of *concept*, where a *concept* is a word that represents a phenomenon by summarizing its major characteristics. From a cognitive science perspective, "*concepts* are abstractions that represent some part of the world; they describe the properties common to class of objects or ideas" (Cerulo 2002, p. 5). Policy concepts group together the aspects of the policy world which are based on similar properties. This helps to identify them easily without enumerating their characteristics each time they are referred to. When concepts are used appropriately, they simplify the world and make communication easy.

Concepts which refer to aspects of objects that are similar from one case to the other are referred to as *constants*. Ideally, all human beings have two legs, and hence the number of legs is a *constant.* However, concepts that refer to aspects of objects that vary from one case to the other are called *variables*. For instance, some people are tall, while others are short, and, hence, height is a *variable*. Policy research usually revolves around variables as opposed to constants because a *constant* feature of a group of objects cannot explain differences in their behavior. For example, if each normal athlete has two legs (*constant*), then the fact that some athletes run faster than others (*variable*) cannot be attributed to the number of legs they have.

Concepts also vary in their degree of abstraction and range from very *concrete* to very *abstract* concepts. *Concrete* concepts refer to easily observable things with shared meanings which are relatively less controversial like age, height, or weight. The easier it is to observe what a concept refers to, the more concrete it is. In contrast, *abstract* concepts, which are also known as *constructs*, refer to things that are difficult to empirically observe such as *policy transfer*, *policy success*, *policy termination*, and *governance*. Wimmer and Dominick (2011) outline three characteristics of *constructs*. First, they are mental abstractions and therefore cannot be directly observed. Secondly, they are abstract ideas or higher-level concepts that have to be broken down into simpler parts that can be captured by lower-level concepts. Finally, they are context-based, and hence the meaning assigned to them when used in a given context has to be clarified for easy communication. Interestingly, most of the variables used in policy studies are *constructs*. Indeed, "numerous concepts in public policy are

either too vague or there is too little agreement on their outlines to measure them" (Innes 1990, p. 173).

## Construct Reliability and Validity

Since *constructs* are abstract, they must first be measured to establish an agreeable meaning before being used in research. Measurement is "the process of linking abstract concepts to empirical indicators" (Carmines and Zeller 1979, p. 10). It is the process of identifying the observable characteristics, empirical manifestations, or indicators of constructs and using them as research variables. The indicators require standard benchmarks or scales on the basis of which the qualitative or quantitative values of the constructs can be measured. There are four cumulatively and progressively related scales used to measure public policy constructs. *Nominal scale* is the lowest and involves classifying policy data into mutually exclusive and exhaustive nonhierarchical descriptive categories. For instance, income can be measured in terms of salaried incomes or non-salaried incomes. *Ordinal scale* also classifies data into hierarchical, qualitative, and non-numeric categories. In this regard, *policy support* can be measured as "low support" or "high support." *Interval scale* uses hierarchical and quantitative categories. For instance, *age* is measured in years. Finally, *ratio scale* has all the properties of *interval scale*, but in addition, each category begins from a fixed and nonarbitrary zero point.

Regardless of the measurement scale used, the meaning assigned to a construct must be agreeable, reliable, and also valid. A measure is considered reliable if it yields consistent results, so that it does not change unless what it measures has changed. A reliable clock does not change unless the time or time zone has changed. Reliability is about the consistency of a measure. A consistent liar is reliable because he always lies, and hence you can preempt his lies by avoiding him. However, a non-consistent liar is unreliable since you cannot tell when he will pull a prank. A concept is reliable if it is used consistently by a community of scholars to refer to the same thing even if, in reality, that is not what it is supposed to refer to.

There is always need to transcend construct reliability to attain *construct validity* which has to do with the accuracy of any alleged link between a construct and the phenomenon it purports to represent. A construct is validly measured if it accurately reflects the phenomenon it seeks to measure. Although a valid measure must be reliable, not all reliable measures are valid. Despite the existence of many forms of validity, construct validity tends to get special attention. Indeed, since Cronbach and Meehl first outlined *construct validity* in 1955, "it has come to be viewed as an over-arching concept which encompasses all the other [validity] forms" (Drucker-Godard et al. 2001, p. 197). Besides, "many writers have further argued that construct validity subsumes all other so-called types of validity and can, in fact, be equated with the basic meaning of validity" (Pearlman 1983, p. 2). Others argue that "only construct validity is really relevant in social sciences" (Drucker-Godard et al. 2001, p. 197).

Construct validity refers to the degree to which research constructs accurately reflect or measure the phenomenon of interest. It is useful to think of constructs as existing at three levels. First, there is the *objective construct* or *construct in itself*, which is the true meaning of a *construct* ascribed to it by its initiators or the community of scholars. Secondly, there is *subjective construct* or *construct by researcher* reflected in the indicators identified and assigned to a *construct* by a researcher in a research context. Finally, there is the *interpretive construct* or *construct by respondent* as reflected in how respondents interpret a *construct* in a specific survey research context. These three levels must match for a *construct* to be completely valid. The researcher, respondents, and research output consumers must have a shared meaning of a *construct*, which must accurately reflect what the *construct* is about.

## Threats to Construct Validity

Threats to construct validity occur when the researcher assigns indicators which do not reflect

the construct accurately. For instance, "claims of *policy success* are in abundance, yet the academic world has barely begun to dig beneath the surface of this key policy phenomenon and the rhetoric that surrounds it" (McConnell 2010, p. 29). Some researchers measure *policy success* in terms of *policy outputs*, while others measure it in terms of policy *outcomes*, and others define it broadly to include both policy *outputs* and *outcomes* (Hill and Hupe 2009). Similarly, "although *policy convergence* constitutes a central concept in comparative public policy, it is not always consistently used and mixed up with related but not equivalent concepts" (Knill 2006, p. 3) like *policy transfer*, *policy diffusion*, and *isomorphism*. Moreover, "various concepts have been used to define privatization, including *contracting for services*, *denationalization*, *commercialization*, *marketization, asset sale, managed competition*, and other processes" (Farrow 2014, p. 52). This trend toward proliferation rather than refinement of existing public policy concepts is bound to exacerbate the problem of construct invalidity.

### Construct Displacement

Both the survey respondents and consumers of research outputs must be brought to bear when conceptualizing *construct validity.* When respondents interpret constructs differently or have different meaning from what researchers intended, then the result is *construct displacement. Construct displacement* occurs as a miscommunication at the conceptual level, between the researcher and respondents regarding the meaning of a construct so that data obtained may deceptively seem to reflect the construct of interest. Some respondents, who do not know what a researcher means by constructs like *climate change*, still make judgments about its effects. It is imprudent to think that such judgments have no reasoned basis; most likely they have their own mental construction of *climate change*. Yet, "nothing is more frustrating for a researcher than realizing that respondents have consistently misinterpreted the meaning of a question [and] hence questions should be worded so that there is no ambiguity about their meaning, because this directly affects the validity of the responses" (Foltz 1996, p. 11).

A common source of *construct displacement* is the practice of soliciting aggregate-level information from respondents during surveys. Many national surveys usually ask respondents to state how well the national economy is doing and then treat the responses as a reflection of the true state of the *national economy*. Yet, *national economy* as a construct evokes different meanings to different people such as gross domestic product (GDP), debt ratio, employment rates, poverty levels, and per capita income. As a construct, *national economy* is derived from intricate mathematical computations which are well beyond the grasp of an average person. Even educated people who do not keep track of national economic indicators cannot tell the state of the national economy. Any country's *national economy* is the same everywhere, so that when respondents make different assessments of the same *national economy*, it may be due to *construct displacement*. Their focus may be on different aspects of the *economy* and hence have different sense of the economy from each other and from the researcher. As a remedy, questions with constructs should be preceded with researcher's clear description of the constructs or by asking respondents to state the meaning of the construct. This helps to detect *construct displacement* and address it during data pretest or cleaning. Otherwise, "the general admonition about survey design is this: pretest the questionnaire" (Foltz 1996, p. 12).

### The Identity-Equivalence Problem

The equivalence problem in comparative studies has to do with the extent to which relevant properties of a construct are similar and bear identical semantic meanings and weight across cultures (Van Deth 1998). The issue is not whether indicators of a given construct adequately capture the reality it is supposed to measure but whether the reality itself is perceived in the same way across cultures. Do constructs like governance, transparency, and accountability have similar meaning across different cultural and national contexts? Are construct indicators operationally visible only at elite epistemic levels where they

are constructed, or are they also visible to the "public"? Undoubtedly, "a crucial problem of comparative research, then, is the establishment of cross-culturally or cross-nationally [or cross-time] valid and reliable instruments" (Van Deth 1998, p. 2). While studies based on a single culture often miss cross-national differences and therefore weak in external validity, cross-cultural studies routinely fail to get identical or equivalent constructs, resulting in *identity-equivalence problem*.

Constructs should be measured in terms which are consistent with how the phenomena they represent are viewed in the study area. However, while most rural societies view wealth and poverty in terms of what they see around them, non-monetary indices of wealth like land and livestock tend to be ignored in wealth indices. Researchers in such societies usually treat a respondent who owns a bicycle as poorer than a respondent who has parked an old car in his compound, even if it can no longer move. However, such societies treat land and livestock as indicators of economic wealth and social status, which they use or sell to meet their needs, the way urban folks draw money from banks for similar or related purposes. Yet unless poverty as a construct is well-defined, it is difficult to design effective intervention policies.

One source of the equivalence problem is construct *translation*. Increased globalization has heightened the need for cross-cultural studies which inevitably demands *translations.* A representative cross-national study of sub-Saharan African countries has to include samples from Anglophone and Francophone respondents and hence require *translations.* Even survey research in linguistically diverse countries such as Nigeria, South Africa, and Kenya certainly require *translation*. Translation problems can be mitigated through inter-translator reliability.

### Conceptual Stretching

The concept of *conceptual stretching* was developed by Giovanni Sartori in 1970 and refers to the distortion in the meaning of a concept brought about by extending the use of a concept to cases for which it is not appropriate or where its features are not applicable. *Conceptual stretching* occurs when a concept developed for a specific set of cases is extended to other cases which are so different that the concept is no longer appropriate to use (Collier and Mahon 1993). *Conceptual stretching* distorts shared meaning of a construct and hence hinders communication at the concept level. Sartori suggested the *ladder of generality* as a solution. He argues that the number of traits captured by a construct should be inversely related to the range of cases that it can cover. The fewer the traits that define a construct, the more general it is and the larger the number of cases that it will be able to cover and vice versa. Intuitively therefore, constructs which are identifiable by many traits can only cover very few cases.

An example of a policy construct that has faced conceptual stretching is *bureaucratic authoritarianism*. The construct was initially developed by O'Donnell in the early 1970s to refer specifically to a new form of military-backed bureaucracies that were evolving in Latin America, especially Brazil and Argentina in the 1960s. Yet, over time, the meaning of the construct was altered to incorporate more cases for study such as Spain, Mexico, the Philippines, Turkey, South Korea, and Greece. In the process, *bureaucratic authoritarianism* began to be used in contexts that clearly are beyond its scope. Scholars such as Charles Andrain (1994) went to the extent of including Confucian China as part of bureaucratic authoritarianism, thus ignoring some of the construct's original defining features like industrial class (Munk 1998).

## Conclusion

Public policy research, like other social research enterprises, must be alive to and be shielded from construct invalidity. This article suggests a broad conceptualization of construct validity that transcends mere matching of variable's *objective* and *subjective construct* levels. For complete validity, constructs must travel the extra mile to also conform to the respondents' and output consumers' possible interpretation of the construct. The

problem is how to predict the interpretations which potential research respondents and research output consumers will assign to a construct and to align them with construct's *objective* and *subjective* levels. One strategy is to measure constructs in terms which are consistent with how the phenomena they represent are viewed in the study area. Another strategy is to disaggregate constructs to lower-level concepts and limit the practice of directly soliciting aggregate-level information from respondents. Relatedly, such constructs should not be used to communicate research outputs without adequate operationalization. Reconnaissance studies should be used to pretest if a construct has been properly disaggregated and to match the three construct levels.

# Constructivist Theories of Leadership

Linda M. Johnston
Kennesaw State University, Kennesaw, GA, USA

## Synonyms

Constructive; Developmental; Empowerment; Leaders

## Definition

Constructivist theories of leadership emphasize new and integrative approaches to leadership development, effectiveness, and evaluation. The resulting research is focused on how leaders see their roles, how they derive meaning from their work, and how they assess their own development.

## Introduction

Since the 1990s, constructivist theories of leadership have emerged to demonstrate new, integrated, interdisciplinary, and innovative approaches to the study of leadership. In the 25 years since the concept was first introduced,

the research in the field has both grown and broadened. Research on constructivist theories have been exploratory, comparative, developmental, and global in nature and pushed the understanding of leadership to include totally new methods of evaluating leadership traits as well as behaviors. At the same time, new tools for evaluating leadership performance have been developed and tested in the field. Robust research in these areas has led to the development of new tools for self and peer assessment. Fields such as public administration and public policy have benefited from these new tools in terms of selection of appropriate candidates for positions, job training program development, job satisfaction, meaning-making, and performance evaluation. The evolving fields of public administration and public policy require the frequent examination of the tools and techniques by which leaders are chosen and appraised in order to best meet the needs of the positions in a specific time and place.

## Leadership Theory

Leadership is one of the oldest studied topics in human history. Leadership theory and research can be driven in many productive ways. Researchers have moved away from simple and uncritical interviews with leaders about what made them successful to examining leaders in the context of their work environment to discover how they find meaning in their work. Researchers can view the traits of individual leaders or the traits of leaders in certain fields, or they can examine the behaviors of those leaders once they are placed into those positions. At the same time, researchers can view the context in which leaders work to better understand the traits that would allow a leader to be successful in that particular context. Up until recently, there has been little connection between leadership theory and the field research on leadership. Constructivist theories of leadership encourage the leader to take a pivotal role in the creation of their understanding of themselves as a leader and their role in both the workplace and in their chosen field. This emerging way of viewing and studying leadership allows for meaning about leadership to be co-constructed between the researcher and the leader and even to include their followers and stakeholders. A leader has the opportunity to create their own meaning regarding their work as well as their workplace. At a time when trust in leaders is at an all-time low, researchers need to examine how leaders view the impact of themselves and their work on their respective constituents. Rather than just critique the leader's work, researchers now can work with the leaders to cocreate different alternatives for dealing with pressing issues or work with the leader to realize new opportunities. Researchers can also view critical and pivotal work events from more than one vantage point or discipline, thereby opening up their perspective while also considering elements of leadership from more than just one individual's goals and needs. Because much of this work is now interdisciplinary and contextualized, social lens can, for example, be juxtaposed or overlaid with psychoanalytical lens to generate a deeper understanding of leadership roles. The research can allow for the examination of the paradoxes and complications at various levels of leadership and the complicated interactions that leaders may experience as they advance into higher management positions. This process also allows for the inclusion of the impact of followers or other stakeholders on leaders and to more directly study leader-follower-stakeholder interactions.

## Development of Leaders

Any leadership role requires particular skills and behaviors in order to be successful. These skills and behaviors can be social or technical in nature or they can involve specific methods of problem-solving or decision-making. While it is clear that some very broad skills and behaviors might be necessary in order to perform certain jobs, it is more the case that these skills and behaviors can vary within the context of where someone works or the level at which they are performing. Joyce and Adams' (2010) work also demonstrates that these skills and behaviors can shift based on political, social, economic, and technological climates and as needs in particular fields shift. Leadership is more than just the assessment of a person's

skills, their role, and the context in which they work, and yet it remains difficult to envision a more comprehensive view of leadership effectiveness or to develop training programs which are of direct benefit to the leaders in a particular context. Leadership identity can now include how the leader sees themselves, how others view the leader, and the leader's place in the larger context.

Constructivist theories of leadership may hold promise for leadership training and development programs. Constructivist knowledge is personally constructed rather than imparted from the top-down. As Kuhnert and Russell (1990) point out, constructive development theory, largely because of its integrative approach to effectiveness, may help researchers better predict leader efficiency and success. These theories, because they focus primarily on the growth of the individual, lend themselves very nicely to a better understanding of the leader and their place in the larger context. They also allow for exploration of leadership roles far beyond individual development needs. Because constructivist learning is learner-centered, personal, and individualized, leaders can change course midstream if a particular process isn't working well for them. Leaders can now be an important part of the research team where they can drive their own training and development requirements, learn through direct interaction with a real-life problem, connect current learning to prior experience and preexisting knowledge, work on tasks which are important to them, participate in their production of knowledge, incorporate meaning derived from critical life events, and be a part of the assessment and evaluation team. This process of training can empower leaders and promote more thorough internalization of knowledge through learned experience. Participating in the construction of knowledge can assist leaders in making necessary cognitive and behavioral changes regarding their role. For example, researchers know very little about how leaders improvise or alter their course in a tough situation or what they learn from experiencing a tough situation firsthand. Current issues that concern leaders like incivility or hostility in the workplace, or project failure, can be dealt with in a way in which leaders can learn, practice, and formulate a plan of action all in the same setting. This process will allow them to directly address issues of immediate concern to them rather than a designated issue or case study from a textbook. Kegan's (1994) research on adult constructive developmental learning discusses the fourth stage of development, self-authoring, which is the stage at which leaders can put a plan in place to correct employee behavior without getting caught up in or held back by the emotions or beliefs of others and, at the same time, keeping the larger vision and mission of the organization in mind. This ability clearly has an impact on one's work life and one's capacity to lead and can empower the leader to become a more effective change agent, as well as become more comfortable in dealing with conflict.

Leaders come away from the training with what Barge and Fairhurst (2008) refer to as "actionable knowledge," and this, the authors say, has a moral dimension to it. It determines a set of permissions about what can be done, what must be done, and what can't be done. This set of permissions becomes particularly important in public service work because it includes permissions, obligations, and prohibitions about the tasks to be accomplished. In this process, the theory → research → practice → theory loop is better connected in the field.

## A Look to Future Research

Fairhurst and Grant (2010) offer what they refer to as a "sailing guide" in order to understand constructionist theories of leadership. They emphasize two points: (1) that this is a "leader-centric approach in which the leader's personality, style, and/or behavior are the primary (read, only) determining influences on the follower's thoughts and actions" and (2) that "emphasis is given to leadership as a co-constructed reality, in particular, the processes and outcomes of the interaction between and among social actors." The authors also share four axes to assist in understanding the various dimensions of constructivist models of leadership. These axes are (1) social construction of reality versus construction of social reality,

(2) praxis versus theory, (3) pragmatic interventionist versus critical/emancipatory, and (4) monomodal versus multimodal. This research is particularly useful for making choices about the research design in order to answer the questions: "Who am I? Which theory? Which research strategy? Which methods of data gathering and analysis? And for what purpose?" This sailing guide may prove especially useful in guiding future research in the field. Constructivist theories of leadership drive different types of questions for researchers and practitioners alike.

Constructivist theories of leadership and the research that accompanies them have been, up to this point, largely individually focused, predominately Western in scope, and dynamic learning processes. The study of the lived experience of leadership in a real-life scenario setting has added greatly to our understanding of the qualities, skills, and techniques of various leaders. Up until now, the sample sizes of many of the studies have been small and the research methods have been largely survey based. As the field of research continues to expand and we better understand leadership in particular contexts, we can learn more about what forces shape a leader's observed performance but perhaps also be able to better forecast how they will experience their leadership role.

## Conclusion

The research in the field also needs to be broadened to include cross-cultural and comparative issues and include studies from outside of the US context. Up until now, much research has been focused on individuals; we need to look more broadly at constructive leadership development in teams and in organizations or industries as a whole. Another avenue for further study would be to look at the developmental stages from a novice or young leader to an expert leader or senior executive. Of particular interest to the fields of public administration and public policy would be the study of both shared leadership roles, the impact of dispersed leadership environments, and leadership that leads not only to individual achievement but to collective achievement as well. Along this same line, there may have been a tendency in the past to attribute most of the success or failure of a project to the leader; the question still needs to be explored as to how much emphasis we should attribute to the leader versus how much we should attribute to the connection between a particular leader and the followers in the group. What is the impact of what happens to the leaders outside of the work context on how they perform on the job? This applies in particular to leaders who have very public roles in their communities and their work and nonwork actions are highly visible. Is it fair to these employees to ask them to bring their nonwork selves to work or to take their work selves out into their communities?

# Consultants and Place-Based Policy

Evan Cleave and Godwin Arku
Department of Geography, University of Western Ontario, London, ON, Canada

## Synonyms

Consultants; Local economic development; Local economic development policy; Place-based policy; Policymaking

## Definitions

Consultant – a private-sector actor external to a public administration system, contracted to provide analytical support, policy advisory, or policy development and implementation assistance (Howlett and Migone 2013).

Fast Policy – policy approaches that are simple and relatively fast to implement but are often superficial rather than substantive in their impact (Cleave et al. 2017a).

Place-Based Policy – tailored and unique policy that targets specific neighborhoods or communities for integrated interventions that respond to geographically specific challenges, leveraging local advantages, ideas, resources, and residents; differs from traditional development and public policy approaches that are more general in their conception, design, and implementation (Bradford 2005).

Wicked Problem – a problem (often urban, social, or economic development related) that is difficult or impossible to adequately resolve through traditional public administration approaches (Cleave et al. 2017b).

## Introduction

This entry examines the role and the influence of private sector consultants in public administration, focusing on reasons for their use and their impact in the specific area of place based policy. Individually, consultants and place-based policy represent key elements of public administration theory; however, in practice there are strong linkages between the two that are difficult to disentangle. By necessity, therefore, this entry considers the two concepts together, examining their relationship within the context of public administration in a more holistic way. This allows for an examination of the influence that consultants have had on place-based policy efforts, which allows for the identification of key roles, strengths, and critiques of consultants that has broader implications for broader understandings of contemporary public administration. Additionally, it provides insight into how place-based policy is formulated, implemented, and measured, as well as the ways it has been used to address issues that places and governments face.

The rise to prominence of consultants (which should not be confused with Privatization in Local Governments) within public administration systems and the increased focus on place-based policymaking have occurred simultaneously since the 1990s, and therefore it is key to understand the context in which these processes have occurred, and how they relate to one-another. To do this, this entry first explains the context for the growth of private consultancies and place-based policy solutions. The role of consultants and their impact are then examined, followed by a critique of the potential advantages and disadvantages of their role in place-based policy development.

## Neoliberalism – Wicked Problems for Public Administration and the Rise of Consultants

In an era of neoliberalism, characterized by a spatial rescaling and decentralization of government power, it is not at all surprising that cities are becoming key sites for public administration and policymaking. Indeed, local governments are increasingly responsible for addressing the service needs of residents as well as the broader social, economic, and political challenges their communities face. Due to these structural changes, strategic planning and policymaking has become an important item within public administration systems. Strategic planning and policymaking has transcended typical timelines (being addressed during election season or city master planning that occur at regular intervals) and instead requires both day-to-day attention and long-term strategy. As noted by many academics, this has become particularly prescient for cities, as spatial changes to political power and responsibility have forced cities to become increasingly responsible for crafting their own destiny.

However, the increased responsibilities for local governments have come during a period of financial austerity and the hollowing out of the

bureaucracy. Accordingly, there has been an increased reliance on private-sector consultants within public administration. Recent studies from Australia, the USA, and Canada have demonstrated that policy advisory and development are regularly being outsourced and privatized at all levels of government (Perl and White 2002). The use of consultants began as a process of supplementing the analytical capabilities with public administration systems, however, has expanded into a broader mandate of policy development. Consultants are assumed to possess the appropriate technical expertise, knowledge, and creativity in finding solutions to the increasing complex issues facing local governments (Momani and Khirfan 2013) and have been lauded as providing flexibility to address policy issues as they arise. Due to these strengths, consultants are now integral stakeholders in the policy development and implementation process (McCann and Ward 2012).

Concurrently to the rise in consultants, an emerging trend is that localities face "wicked problems" that traditional public administration approaches cannot adequately address. With their inherent complexity, these problems are resistant to traditional sectoral interventions designed and delivered in a top-down fashion by individual government departments. Wicked problems are the ones that "cross departmental boundaries and resist the solutions that are readily available through the action of one agency" (Perri et al. 2002: 34) and are distinguished as being complex and multilayered policy programs that involve a wide variety of actors from differing background (i.e., elected officials, public administration, private sector, and the public) who need to create links between issues (Smith and Torjman 2004). For cities and other localities, prime examples of wicked problems include: housing and homelessness, local economic development, place branding and marketing, and urban planning.

As Bradford (2005) identifies, these wicked problems highlight critical information gaps about what information, policy, and action is required to help and often make clear the systemic failure of coordinating the development of policies and resources to the right target areas. These problems cannot be solved through "off the shelf solutions," but rather well-crafted solutions that require the leveraging of location-specific advantages and resources, as well as broader collaborations that cross functional boundaries and departmental silos within the public administration.

## Place-Based Policy

Among other solutions to these problems, a prominent approach used by local and state governments has been place-based policy. Previous approaches to solving wicked problems have emphasized individual-based policies (such as welfare-to-work programs and skill training schemes) or broad incentives and tax-breaks for firms. Place-based policy, on the other hand, targets specific areas for interventions in response to location-specific challenges and is meant to fully engage the ideas and resources of community and its residents. Place-based policy exists in a framework of two inter-related components: first, general policies guided by the urban lens that assesses their spatial impacts and takes account of local community needs and capacities in design and delivery, and second, targeted interventions focused on the special challenges in certain areas (Bradford 2005). As such, place-based policies need to emphasize qualities of the area and be tailored to maximize local strengths and opportunities to address wicked issues.

## Consultants and Place-Based Policy

Within public administration, the hiring of consultants has become extremely popular in developing and implementing place-based policies, with particularly high influence found in issues of local economic development and place branding. Consultants in this context are instruments of governments, meant to specifically address gaps in local organizational capacity. This sort of involvement has been linked to "hallowing" of organizational capabilities. Broadly, the use

of consultants falls into two categories: general-consultants, who provide local governments with a specific toolbox of universally applied approaches and policy solutions to respond to problems that are well identified, and expert-consultants, who are tasked with solving problems that are emerging and opaque in nature, and who intervene with the capacity to formulate solutions that are context-specific and tailor-made to deal with issues unique to the locale. As a result, different consultants are utilized in different situations, based on the existing capacity within the local administration and what gaps or weaknesses need to be filled (Cleave et al. 2017a).

To address wicked problems with place-based solutions, while still working within the fiscal constraints that most governments face, consultants are viewed by administration officials as an optimal solution. Their advantage is that they operate within an agreed upon framework (i.e., budget, timeframe, and issue); bring expertise, skills, and specialized knowledge that hallowed out government systems lack; and because they are seen as external to the existing public administrative system are often viewed as being more credible and objective in their policy recommendations. In particular, all types of consultants are used to provide analytical capabilities that hollowed-out local governments' lack, such as the necessary policy analysis capacity to perform the policy-development and implementation process, particularly with evidence-based policy. The development of policy without any evidence-based analysis is one of the common sources of policy failure, and therefore, consultants are seen as an avenue to access analytical capability. Thus, consultants can be in a better position to fully analyze the state of the locality, explore its realities (strengths, weaknesses, and assets) in a more thorough manner, and therefore be able to make stronger policy recommendations. Indeed, a current critique of public sector policymaking is the lack of outcome quantification and understanding of policy effectiveness. A key role that consultants can play is in measuring and analyzing the impacts of policy implementation. This can identify areas where policy approaches are working, as well as in the identification of areas that need improving or fortification. As wicked problems are complex, place-based policy solutions need to be able to adjust to address issues that arise as local realities change. Due to the narrowed focus of their work and responsibility, consultants can play a key role in ensuring the maintenance of policy, allowing for day-to-day upkeep as well as long-term strategic planning to occur.

Additionally, consultants have been described as having two other distinct advantages over the bureaucracy that are relevant to place-based policy development. First, consultants are able to coordinate and operate across the administrative and functional boundaries that have limited the effectiveness of government-based policy development efforts. Due to their nature – operating outside the bureaucracy – consultants have the potential to better coordinate the full resources of the community towards addressing a wicked problem, and therefore developing a stronger place-based response. Finally, consultants bring greater technical knowledge and skill to the policy development process. As consultants often work with multiple public-sector entities, they can bring greater experience and knowledge of how to approach place-based policy development, and therefore may be able to address problems in a more efficient manner, with greater specificity, than local government officials alone.

## Critiques of Consultants Use in Place-Based Policy Development

Despite their potential utility – and their increased usage by public administration systems – there are several key critiques of the use of consultants in place-based policy and its development. First, while consultants have the ability to cut across the boundaries that are required in place-based solutions, it remains unclear whether this is actually filling in gaps within local government. Recent research (Cleave et al. 2017a) suggests that local governments often underestimate the

knowledge, skill, and ability to coordinate resources. Instead, the immediate reaction is now to employ a consultant, when, in fact, the place-based policy development can be done in house.

Second, the use of consultants has been criticized as creating an administrative environment characterized by policy homogenization, policy migration, and the over-reliance on fast policy solutions (Cleave et al. 2017a). This, in part, is due to the oligarchical nature of consultancy in public administration where a limited number of companies (approximately 5%) hold the majority of contracts (over 80%). An outcome of this uneven distribution of contracts to consultants, the same firms and individuals are being employed multiple times in different locales and administrative contexts. As discussed, place-based solutions require carefully tailored policy for each situation; instead, however, the current state of relationship between public administration and consultants lends itself to considerable policy migration. As a result, circuits of policymaking are created and reinforced where a limited number of consultants facilitate the transfer of basic policy scripts between places. There are several implications. These policy scripts represent fast – rather than substantive – approaches to policymaking, where superficial measures are being developed to address complex problems. This reliance on private consulting firms and their associated policy transfers suggest there is greater emphasis on political expediency rather than developing a place-based policy program that has realistic expectation of transformative impact. Additionally, several wicked problems – such as those related to economic development – may also involve some form of regional or international competition between places. As homogenization increases through continual copying and greater uptake of the same policies, cities will essentially cancel out each other's efforts, resulting in policy that is ineffective in addressing local challenges.

Extending on this, the third critique of the use of consultant in place-based policy development involves local knowledge. Place-based solutions require considerable local knowledge and specific policy expertise that is tailored to the local political and economic conditions, and a policy development approach should be sufficiently malleable to the different needs of each locale. A critical limitation to consultants is their general lack of local knowledge and experience – as they are typically external to the community – and without which locally developed policies are doomed to failure. Without key insight to the locale, it will prove near-impossible to develop policy that will have a meaningful local impact. When expert consultants are employed, they can possibly be able to overcome this lack of local knowledge. However, it is increasingly clear that general consultants or generic approaches (i.e., relying on policy migration and fast policy scripts) suggest that there is often a misspecification between the type of consultants that are needed for effective place-based policy development, and those who are actively being employed.

## Conclusions

The use of consultants who are external to public administration systems are on the rise, particularly within local governments. In policy areas such as place-based development, consultants have become the primary source for analysis of local conditions and policy limitations, as well as in policy development. Despite the sentiment that consultants generally have greater experience, knowledge, and expertise than their public administration counterparts, there are in fact few true expert consultants that can engage the policy development process in a meaningful and substantive way. Instead, the reliance on general consultants has created a climate of policy migration and fast policy, limiting the appropriateness of the place-based policy solutions being developed and their impact on addressing wicked local issues.

The role of consultants, therefore, must be carefully considered. They must play a complementary role in policy development, rather than

one that duplicates local resources. There can be a need for consultants in specific situations, when there is an obvious lack of capacity and when there is a meaningful problem to be addressed. Accordingly, consultants should only be used when the entire range of their expert knowledge and skill can be tapped to solve a problem. However, this recommendation appears at odds with practice, as public administration is becoming increasingly reliant on consultants.

## Synonyms

Competition; Consumer Affairs and Price Control; Consumer regulatory framework; Consumer welfare; Pacific Island countries

## Brief Definitions

Monopoly – a business that does not have a competitor.

Externalities – the costs associated with the production and consumption but are not captured in the market price.

Public interest theory – unrestricted markets lead to failure; government is capable of correcting these failures through regulations; regulators intervene to protect public interests from malpractices and misconduct in the marketplace.

Private interest theory – regulations only benefit certain effective groups in the society; wealth is maximized toward some effective group in the society.

Economic theory of regulation – regulations aim to achieve special interest of the powerful interest groups rather than upholding the public interest.

Capture theory – regulators are captured by the regulated private businesses with the intention of

gaining a favor from the regulated businesses in the future.

Political theory – there are cases where the noneconomic interest groups may capture the regulator.

## Introduction

Market regulations apply to markets operating within any government institutions such as the common law institutions including property rights, liability rules, and contract laws as well as the institutions influencing them (Joskow 2010). The significance of market regulation is to ensure that consumers are protected from unfair practices in the market. Thus, an effective consumer regulation should address market failures in an inexpensive manner without hampering the competitive process so that consumers have choices regarding prices and products, and it should ensure that there are fewer barriers of entry and exit in the market (Koopman et al. 2015; Wright and Helland 2013). Apart from addressing market failure, market regulation also enhances the efficiency of the government programs, promotes civil rights, or provides for universal access to services deemed important (Dudley et al. 2017).

There are two theories that apply to consumer welfare and protection, and these are public interest theory of regulation and private interest theory of regulation. As per the former, consumer welfare can be enhanced through regulations. Therefore it refers to the optimal allocation of scarce resources to individual and collective goods and services to the society. However, the allocation of optimal resources is not optimal from the theoretical perspective; thus, the need to enhance the method of allocation by regulation arises (Hertog 2012; Koopman et al. 2015).

According to Brill (2011) and Koopman, Mitchell, and Thierer (2015), public interest theory assumes that unrestricted markets lead to failure due to the issues of monopolies (a business that does not have a competitor) and externalities (the costs associated with the production and consumption but is not captured in the market price), price gouging, and unequal bargaining powers and further assumes that government is capable of correcting these failures through regulations. The assumption of public interest theory is that regulators intervene to protect public interests from malpractices and misconduct in the marketplace (Ahmed 2016). Also, it has been assumed that its existence is due to significant market failures to protect the public interest (Urassa 2014).

However, this theory has been criticized since the public interest theories of regulations depend on leadership and the governments who have recently been seen as decreasing their capacity in boosting public value (Roman and Mcweeney 2017). As per Ginosar (2014), everybody wants to maximize their own interests; thus, this is not an exception for the regulators and results in regulation failure.

Private interest theory, on the other hand, states that regulations only benefit certain effective groups in the society. This theory assumes that wealth is maximized toward some effective group in the society such as the consumers/consumers group, regulators or their staff, legislators, and union (Samaha and Khlif 2016). It also suggests that regulations will create much inefficiency in the market (Urassa 2014). Within the private interest theory, there are three main schools. The first school is the "economic theory of regulation" whose main assumption is that regulations aim to achieve special interest of the powerful interest groups rather than upholding the public interest. The second school of thought is the "capture theory" "which assumes that regulators are captured by the regulated private businesses with the intention of gaining a favour from the regulated businesses in the future" (Ginosar 2014, p. 305). The third school of thought is "political" which assumes that there are cases where the noneconomic interest groups may capture the regulator (Morgan and Yueng 2007; Ginosar 2014).

Furthermore, an effective market regulation is one that will maximize consumer welfare in terms of setting fair prices and one that takes into account the unit costs, fixed costs, and the operational costs of resources. It also protects

consumers from deceptive advertisements and hazardous products and promotes competition. For example, the United States and Australia have a regulation against harmful products, and that is the Consumer Product Safety Act 1972 and the Consumers' Protection Law of Australia, respectively (Cowan 2004; McGarit 2013; Rotfeld 2010; Wood 2017). Similarly developed countries such as Germany and France adopted different approaches to enhance consumer information. German policymakers concentrated on providing consumers with precise technical product information through a strict set of regulatory policies to regulate the content of commercial speech and provide useful information to consumers, whereas France policymakers impose relatively weak information requirement as they value creative advertisement. This approach is to uphold circulation of objective product information derived from comparative product tests (Rothschild 2016; Trumbull 2006).

Moreover, there are fines imposed on deceptive advertisements or misleading information to discourage businesses from misleading the consumers as well as to restructure their competitive marketing strategy. The optimal fines should exceed the benefits of the violation taking into account the cost of detecting the breach (Passarini et al. 2017).

Hence, there is a need for reform in the legislation regarding advertisement to prevent misleading information and price baiting (the practice of luring consumers with unrealistic low price to bring them to the shop and then selling them the expensive goods). An example of this reform in South Australia is what occurred between the years of 2000 and 2008. The reform ensures that there is transparency in real-estate transactions, targeting bait pricing in the real-estate advertisements, which are fraudulent or deceptive (Kupke et al. 2014; Meloni 2010).

In the United Kingdom, one contentious issue is, even though market regulation is a buffer between the regulated economic activities and the enhancement of consumers' welfare, it negatively impacted on competitiveness, firms' performances, and its inputs as well as employment. However, better institutions, (one that is independent from political influence, considers all contingencies, and incorporates all strategic versions of regulatory policies) can help to reduce the adverse impact of regulations on macroeconomic performances (Fooks and Mills 2017; Messaoud and Tehen 2014). Hence, an effective regulatory policy needs full government approach in order to take into consideration the dynamic perspectives that interplay between the different institutions involved in the regulatory process. The departments that hold vital responsibilities in the regulatory policies are finance, justice, trade, and industries, but accountability should be increased in all government ministries (OCED 2017). In addition, when comparing the regulatory regime of the developed and developing countries, it is essential to understand the interaction between the regulatory regime and the context of the country that will enforce the regulation (Lodge and Stirton 2001).

According to OECD (2017), an ideal market regulatory framework is able to capture all contingencies and incorporates strategic version of a healthier regulation policy that clearly defines its long-term directions and its intentions of contributing to the public policy goals. An ideal regulatory framework should be designed in a tailor-made manner, considering the findings of cognitive sciences (Atamer 2017).

Moreover, as per Wood (2017), consumers need protection in the following areas:

1. Weights and measures (the measurement of volumes of oil, wine, and grain) to ensure there is uniform trade measurement legislation.
2. Public health and food ensuring the businesses comply with the Public Health Act. Due to the increasing growth of patent, such protection is necessary for the protection of reputable businesses from disreputable competitors.
3. Dangerous people, prevention of undesirable people carrying out certain occupation, which is risky for consumers.
4. Building, to ensure only qualified contractors are allowed to construct buildings.
5. Deceptive products mitigated through the enactment of product liability provisions in the United States as well the English law.

Consumers need protection to ensure they enjoy and exercise their rights to safety, rights to be informed, rights to choose, rights to be heard, rights to redress, and rights of privacy (Alsmadi and Alnawas 2017; UNCTAD 2018a, b). Therefore, countries such as Croatia have a separate legal regulation of consumer protection to protect the citizen rights and interests when purchasing goods and services for their personal needs (Josipović 2013). According to Rotfeld (2010), consumer protection is not to protect consumer but to protect the system of competition since the businesses are getting bigger and the industrial world is becoming complicated. Therefore, the activism of consumer protection has been originally to protect the marketplace rather than the consumers. He further suggested that consumers could protect themselves if they are well informed about the market, and this can contribute positively to the system of competition. However, a reasonably well-informed consumer is not always a perfectly reasonably informed consumer capable of making sound decisions since information is costly to obtain and translate (Pappalardo 2012). Hence, the argument is not always true.

As per Nyberg et al. (2012), in a market, there are rational and imperfectly rational consumers (consumers who misperceive the benefits and costs of a product or service). In this instance, the businesses can exploit the misperceptions of the imperfectly rational consumers and where there is limitation in educating those consumers in terms of the products, services, and contracts. In this situation, competition exacerbates the misperception of consumers. Hence, market regulation is needed to protect the imperfectly rational consumers, or a sophisticated mediator should assist in advising the imperfectly rational consumers since the benefit of competition does not necessarily cover the imperfectly rational consumers (Gans 2005; Bar-Gill 2011). However, according to Atamar (2017), information asymmetry is a myth since information is costly to produce and equal distribution of information is expensive, but an informed consumer can make a sound marketing decision.

Market regulation is important in protecting consumers against various issues such as misleading information, restriction of information to those who pay, difficulty in the evaluation of the characteristics of all products and services by consumers, and also the market incapability to regulate itself in the context of social and economic activity (Akinbami 2011; Lee 2017; Tirole 2014). However, in developing countries, less attention is given to consumer affairs, and it leaves a vague status of consumer rights with apparently poorly oriented consumer culture (Alsmadi and Alnawas 2017). Additionally, well-informed consumers would force the industries to enhance the quality of goods and services that meets their requirements, thus triggering competition (Campbell et al. 2011; Lodge and Stirton 2001). Another important consideration is the consumers' access to redress mechanism (the act of rectifying or compensating the consumers) if they have experienced unfair practices or suffer losses in the market. It is important that consumers who suffer loss seek redress or compensation in the tribunal or court (Wood 2017; UNCTAD 2018a). The forms of redress can be strengthened by providing more efficient ways to resolve disputes between consumers and businesses (Sitnikov and Bocean 2014).

Moreover, consumers through procedures such as consumer dispute resolution and small claim courts can directly and indirectly use consumers' policy on redress. Countries such as the United Kingdom, United States, Canada, and Australia have small claim courts, which is moderately effective in providing consumer redress (Delgadillo 2014; Paterson 2011). Apart from that, consumer complaints are solved through direct resolution, for instance, the refund of product or service. That is a cheaper solution for businesses and provides the fastest recompense for consumers (Delgadillo 2014; Paterson 2011; Zakuan et al. 2012).

## Background of the Consumer Protection Institutions in Solomon Islands and Fiji

The Solomon Islands is a sovereign Melanesian country located in the South Pacific Ocean, southeast of Papua New Guinea and northwest of Vanuatu. More than 90% of the population is

Melanesian. The population size is 600,000 and the country has a total area of 28,900 $km^2$. The major languages are English (official) and Melanesian dialects. Major religion is Christianity and the currency is Solomon Islands dollar ("Solomon Islands country profile," 2018; "Country profile of the Solomon Islands," 2016).

Solomon Islands is an agricultural-based society with main industries of copra, timber, palm oil, fish, cocoa, and beef cattle. The country is relatively rich in minerals and forest resources ("Country profile of the Solomon Islands," 2016).

The Republic of Fiji is an island in Melanesia in the South Pacific Ocean about 1,100 nautical miles northeast of New Zealand's North Island. Fiji is one of the most developed economies in the Pacific relying heavily on its tourism and sugar industry. The population of Fiji is 900,000 with an area of 18, 376 square km. The major languages in Fiji are English, Fijian, and Hindi. The major religions are Christianity, Hinduism, and Islam ("Fiji country Profile," 2018).

The Consumer Affairs and Price Control (CAPC) Division is a unit within the Ministry of Commerce, Industry, Labour and Immigration. The Division's vision is to become an effective advocator of consumer rights in Solomon Islands. Its mission is to promote and safeguard consumers' legitimate interests and to ensure that the consumer rights of families, communities, cultures, and environments are protected through consumer protection, weights and measures, and control services.

The Fijian Competition and Consumer Commission (FCCC) is the competitor regulator in Fiji that ensures integrated framework for regulating the monopoly market structure encouraging competition, restrictive trade practices, and consumer protection and is responsible for controlling the prices of public utilities and some other price-controlled items such as the common basic goods consumed by the consumers such as flour, tuna, and bread.

The Consumer Council of Fiji (CCoF) is a watchdog that protects the rights of consumers through the promotion of fair delivery of goods and services. The insight of CCoF into consumer needs is a powerful tool in influencing the decision-makers to bring about change. The council protects the vulnerable groups in the society such as the poor, the physically and mentally challenged, children, and women by identifying and articulating policy issues that are important to consumers.

This entry focuses mainly on the functions and powers of the CAPC Division regarding market regulation and consumer protection and compares them to the functions and powers of FCCC and CCoF. The comparative analysis is to identify loopholes that need strengthening. Consumer protection is vital for a possible development in a Pacific Island country (PIC) such as Solomon Islands (ADB 2016).

The following acts in Table 1 mandate the three consumer protection institutions (CAPC Division, FCCC, and CCoF) in Solomon Islands and Fiji, respectively.

Table 1 shows the acts that mandate the functions and powers of CAPC Division to protect the consumer interests, which are the Price Control Act 1982, Consumer Protection Act 1995, and Weights and Measures Act 1980. The FCCC functions and powers are mandated by the FCCC Act 2010, and CCoF functions and powers are authorized by CCoF Act 1976. As such, their duties and powers of regulating the market and protecting consumer interests are within these jurisdictions.

The acts indicate that CAPC Division and FCCC have regulated the market in terms of price control on basic goods and items. Tables 2 and 3 show the basic goods and items that are

price controlled by the CAPC Division and FCCC, respectively.

These two institutions emphasize on controlling the prices of basic goods and items as a form of protecting consumers from being exploited by traders. Also prior to regulating the price, a thorough assessment is done to ensure that prices are viable and traders are not disadvantaged. On the same note, the effective market regulations enforced by CAPC Division and FCCC is to maximize consumer welfare in terms of price fairness. Scholars like Cowan (2004) and Rotfeld (2010) have also supported this practice.

The CAPC Division, FCCC, and CCoF further protect consumers in promoting social justice when an issue arises. Scholars such as Stinikov and Bocean (2014) and Wood (2017) also support this view. However, CAPC Division has not done any prosecution so far, as the process is too lengthy and time-consuming. Therefore, cases are resolved through refund of cash and replacement of products. None of the complaints reach

the court since consumers want to reach faster resolution (Interview with Adam 2018). FCCC also has the power to prosecute scrupulous traders unlike CCoF who do not have the power to prosecute; however, it supports complainants, should the case reach such resolution.

The three institutions also ensure that consumers function effectively in the market in terms of understanding their rights and responsibilities. They protect consumers by eliminating unacceptable behavior in the marketplace and ensuring products and services are safe for consumers to use or consume. These practices are supported by scholars Alsmadi and Alnawas (2017), UNCTAD (2018a, b), and Wood (2017).

Furthermore, the institutions invite consumers for their views on legislations, regulations, and other domestic policies and proposals. For instance, FCCC invites the consumers and stakeholders to give their submission or views on any changes in the market such as increases in tariff by Energy Fiji Limited (EFL) before it comes into effect.

The institutions further protect the consumers by ensuring that manufacturers or traders offer goods that meet reasonable standards of durability, utility, and reliability and are suitable for the purpose for which they are intended. This is similar to the Australian regulations against harmful and dangerous products, which is the Consumer Protection Law of Australia. These practices and examples of Australia are also highlighted by scholars Cowan (2004), McGarit (2013), Rotfeld (2010), and Wood (2017). Furthermore, the three institutions ensure efficient operation of any person or body engaged in the production of goods or in the provision of services or in activities connected with or incidental to the production of goods or the provision of services. They represent consumer interest internationally and in the government.

They also establish and maintain legal and administrative measures to enable redress through procedures that are expeditious, fair, inexpensive, and accessible. They help to develop, strengthen, and maintain a strong consumer policy for the protection of consumers in accordance with the economic and social circumstances for the country. This is in line with the suggestion of Atamar (2017) who stated that an ideal regulatory framework should be designed in a tailor-made manner. Scholars such as Lodge and Stirton (2001) also mentioned that it is vital to understand the regulatory regime and the context of the country. The practices of the institutions are in line with the above scholars' suggestion.

The CAPC Division further regulates the market and protects consumers by regulating weights and measures to ensure that the weighting and measuring instruments used by traders are in accordance with the Weights and Measures Act 1980 and that they are fair to consumers who purchase such goods and items. Scholars such as Wood (2017) contend that such measures will ensure that there is uniformity and fairness in the weights and measuring instruments in the market. FCCC however does not regulate weights and measures since this comes under the responsibility of the Ministry of Industry, Trade and Tourism (MITT).

In terms of compliance and competition, awareness provided by the CAPC Division enhances the compliance level of the businesses as well. The number of complaints also declined compared to the past years. The number of complaints lodged in 2018 was only 20 (The CAPC Division did not disclose the number of complaints for previous years.). However, the CAPC Division's awareness coverage is limited as it focuses only on schools, clinics, and media (radio) once a week. This is why the message or information does not reach the entire population particularly those in the remote areas, resulting in consumers still lacking proper knowledge about their rights and responsibilities. Scholars like Rotfeld (2010) also suggest that well-informed consumers can protect themselves and can contribute effectively to the system of competition. However, Pappalardo (2012) argued that a well-informed consumer does not always make sound decisions in the market due to the cost of obtaining and translating information. Nevertheless, the practical side of awareness is positive which shows the declining number of complaints in Solomon Islands.

FCCC and CCoF, on the other hand, carry out greater awareness and are able to reach out to remote places or communities that are disadvantaged by transportation and distance. Also, they do not limit awareness to media but conduct workshops, visit schools and universities, make community visits, and send out teams to visit remote areas and facilitate World Consumers Rights Day. These means of awareness help to spread the information and educate the consumers as well as traders and reduce complaints and improve compliance level of businesses.

In addition, FCCC and CCoF have offices in the northern and western parts of Fiji which are responsible for these regions, unlike the CAPC Division that does not have any branch apart from the central office. Thus, reaching out to the scattered provinces with limited resources for awareness and monitoring purpose is quite impossible. In light of protecting consumers' interest, the CAPC Division does not control competition unlike FCCC but promotes competition by enforcing the acts of other government ministries, as its competition policy is still underway with the assistance of Asia Development Bank (ABD). Therefore, the Division upholds the standards and acts of other government ministries and agencies since competition is the responsibility of other government ministries such as the Ministry of Mines, Energy and Electrification. Due to this limitation, the CAPC Division encounters discrepancies in the course of its duty when upholding the acts of other government ministries such as imported items not complying with the required standards in accordance to the acts they are enforcing.

For instance, electrical goods found in the shops do not meet the required standard in the Mines, Energy and Electrification Act 1990 which disrupts their duties.

FCCC, on the other hand, further protects the consumers by controlling and regulating the prices and charges in the industries that have less competition or are monopolies. Similarly, Commerce Commission NZ regulates industries where there is limited competition and monopolies to ensure consumers are not disadvantaged by lack of competition. Commerce Commission NZ promotes competition along the supply chain of the regulated industries. For example, in the airline industry, competition is facilitated between airlines (Commerce Commission NZ website). Likewise, ACCC regulates some national infrastructures such as communication and energy and monitors some infrastructures where there is limited competition (ACCC website).

Table 4 shows the industries that are regulated by FCCC. Hence, FCCC promote competition in a more thorough manner and consider all relevant factors where cases are assessed individually and a thorough comparative analysis with literature review based on countries with similar economies like Fiji is carried out. This provides a holistic view on the needs of that industry that needs to be controlled and regulated and helps to make recommendations for suitable policies for that industry.

## Recommendations and Conclusion

The following suggested recommendations are put forward to enhance the operation of the

CAPC Division regarding market regulations and consumer protection.

The government should prioritize market regulation and consumer protection as one of the key areas to focus on, in terms of budget and policies. When regulation is given importance as the key area, it shows government commitment and makes it easy to seek assistance from aid donors especially when the Division is always facing budget constraints. This recommendation was also suggested by the ADB report (17) in which it stated that prioritizing this area will lead to the achievement of viable development for a small island state such as Solomon Islands. The Division will also be more effective when enforcing their functions like FCCC and CCoF.

Moreover, the market is dynamic; thus, the CAPC Division's acts (Price Control Act 1982, Consumer Protection Act 1995, and Weights and Measures Act 1980) and regulations need to be reviewed to cater for the current market. Hence, utilities such as electricity need to be regulated since it is largely used by consumers. For instance, Australian Competition and Consumer Commission (ACCC) and FCCC regulate electricity since it is a utility that is widely used by the general public.

Another recommendation is to increase the powers of the CAPC Division like that of FCCC so that the Division does not enforce other government ministries or agencies' acts, causing inconsistencies and disruption in their duties. These inconsistencies can be avoided if the Division's acts are reviewed and responsibilities are better consolidated.

On the same note, the CAPC Division should become a statutory body so that it has more powers to carry out its functions since it is an independent body such as FCCC and CCoF.

If the Division becomes a statutory body, there will be a possibility of establishing a small claims court to deal with compensation and small claims, since it is time-consuming and expensive for cases to be heard in magistrate court. Redress matters can also be reached promptly.

The CAPC Division can also enhance its awareness program from just going to schools, health clinics, and the weekly broadcast over the radio. It can, for example, conduct road shows and visit tertiary institutions such as the Solomon Islands National University (SINU) and University of the South Pacific (USP) campus in Honiara. Also, the Division should conduct workshops for consumers and organize a mobile team to visit the provinces or the communities so that they are fully aware of their rights and responsibilities like what is being practiced by FCCC and CCoF. This will make it easier for the Division to solve any complain and also further reduce the number of complaints.

To conclude, the market regulations enforced by the three institutions to protect the consumers' interest are quite similar. However, it appears that the CAPC Division regulates the market but not to the extent done by FCCC, CCoF, ACCC, and Commerce Commission NZ who regulate monopolies, control and promote competition, and protect consumers by providing in-depth awareness. In addition, FCCC and CCoF are statutory bodies and have their branches in the western and northern divisions apart from the head offices in Suva (capital of Fiji) Central Division. As such, these institutions have broader powers to deliver their functions as well as employees to carry out the duties unlike the CAPC Division, which is not a statutory body and has limited employees with no branches apart from the main office in Honiara (capital of Solomon Islands). Overall, the CAPC Division's regulation framework is concrete and similar to the regulations implemented by FCCC and CCoF but in a narrow scope and with limited resources.

## Synonyms

Brand favorability; Brand strength; Consumer attachment to a brand

## Definitions

| | |
|---|---|
| Consumer-based brand equity | Consumers' thoughts, feelings, perceptions, images, and experiences about the brand that occurs when consumers are familiar with the brand and hold favorable, strong, and unique brand association in their memory. |
| Social-environmental analysis actions | Practices of interacting with the customers, understanding customer needs, mapping the environment, and planning and monitoring of execution of organizational goals. |

| | |
|---|---|
| Error management actions | Practices of continuous detection and correction of errors and proper usage of feedback from customers to improve organizational performance. |
| Connectedness with customers | The strategic effort of build customer relationships beyond the initial transaction that results into bonding, trust, and believability in the firm and its products. |

## Introduction

The ongoing transformation of branding in developing countries remains under-researched despite its central importance in promoting competitive advantage (Shaalan et al. 2020). Firms that practice branding endeavor to create a reliable brand equity and build sustainable competitive advantage (Hussain et al. 2020). Brand equity is a marketing asset (Srivastava and Shocker 1991) which stimulates a unique and welcoming relationship, thereby strengthening the bond between the firm and its customers (Lambkin and Muzellec 2010) and nurturing long-term buying behavior. Developing a strong consumer-based brand equity therefore is one of the ultimate aims of firms (Tran et al. 2020) because firms that have invested heavily in consumer-based brand equity are able to retain their customers over time which makes them highly competitive (Yoo et al. 2000). Consumer-based brand equity is therefore the differential effect of brand knowledge on consumer response to the marketing of the brand and thus consists of brand awareness, brand associations, brand perceived quality, and brand loyalty (Keller 2016; Yoo et al. 2000). Davcik, Silva, and Hair (2015) explain the concept of consumer-based brand equity as the major asset for an organization that determines the performance of its products in the market place, yet creating a favorable consumer-based brand equity has remained a challenge for beverage manufacturing firms as evidenced in the continuous firm closure and product failures on the market (Caroni and Pierri 2020). In sub-Saharan Africa, Uganda in particular, there is a high rate of business failure which is estimated to be at 30% (Kituyi and Balunywa 2012; Tushabomwe-Kazooba 2006), and it is associated to challenges of building a reliable consumer base which subsequently leads to consumer-based brand equity (Buzdar et al. 2016).

Current literature has dealt with the subject of brand equity extensively (Branaghan and Hildebrand 2011; Kapferer 2012; Myers 2003; Keller 2013) with little emphasis on the ontological variants of consumer-based brand equity. Research about the antecedents of consumer-based brand equity and the context in which it is enacted and built in a competitive beverage manufacturing setting is sparse especially in the context of developing economies. Building on the work of Aaker (2009), Keller (2013), and Cuong and Khoi (2019) who detailed the elements of brand perceived quality, brand association, brand loyalty, and brand awareness as components of consumer-based brand equity, these studies are limited in explaining the actions of firms that contribute to the formation of consumer-based brand equity. Furthermore, the study of Cuong diagnosed these elements at a broader level of brand equity with less emphasis on the specific actions that are taken to form the desirable consumer-based brand equity for the firm. Cuong's study is also based on quantitative data from retailer goods in a Vietnam setting and therefore lacks the originality in constructing consumer-based brand equity.

Relatedly, Shaalan et al. (2020) quantitatively confirmed the relevance of brand loyalty, brand awareness, brand association, and perceived quality as constructs of brand equity and established causality from brand loyalty to brand equity, in the banking sector. However, this study is limited in explaining the constructs of consumer-based brand equity and the specific actionable antecedents. In spite of the findings from these studies and many others that attempt to use the brand equity model, the antecedents and constructs of consumer-based brand equity derived from beverage manufacturing setting and with evidence of firms that have been able to build recognizable brand equity are still not well documented.

Christodoulides and De Chernatony (2010) also asserted that for a better understanding of the concept of consumer-based brand equity, there is a need for a thorough investigation of the concept with a focus on specific industry and within a given cultural context. This paper fills this gap in literature and posits that consumer-based brand equity in a beverage manufacturing setting is a result of actions taken by firms and the connectedness with consumers that result into bonding and emotional attachment with the brand. This thinking is rooted in Leibniz's et al. (1967) discourse on metaphysics which asserts that all true predication has some basis in the nature of things.

To effectively theorize consumer-based brand equity, examining success stories of firms that have created strong and reputable brands locally is an important approach. Therefore, understanding the processes through which these firms have gone through results into a socially constructed reality that requires an interpretivist's epistemology from the company actions (Galutira 2018). This is further supported because interpretivism epistemology has been given less attention by consumer-based brand equity scholars, yet consumer-based brand equity is an antecedent of brand performance (Oliveira-Castro et al. 2008). This paper therefore focuses on the JESA Dairy Ltd. story depicting how the firm was able to build a recognizable brand that consumers are proud to be attached to. The paper also uses action regulation theory (Frese 2009) to deliver practices that can be adopted by beverage manufacturing firms in sub-Saharan Africa in the process of building consumer-based brand equity and unified theory of brand equity to derive the ontological variants of consumer-based brand equity as demonstrated in the story. JESA as a beverage manufacturing firm was used to tease out the practices that lead to consumer-based brand equity among beverage manufacturing firms. This paper is premised on the fact that consumer-based brand equity is a dynamic and complex subject that calls for continuous transformation of ground rules to enable customer satisfaction, social-environmental analysis, and establishment of error management culture within an organization that results into meaningful connections with customers to persuade them to believe in the firm.

## Building a Consumer-Based Brand: The Success Story of JESA Dairy Ltd.

In 1988, the late James Mulwana and his wife established a dairy farm at Mikka Village, Wakiso District in Uganda with 120 local cows producing 500 hundred liters of milk per day sold to different milk retailers around Kampala. As production increased, milk retailers couldn't sell all this milk, resulting into 150 liters of milk getting spoilt daily. Mr. Mulwana was then advised by the milk retailers to sell pasteurized packed milk and also venture into other milk products like yogurt and butter. He interacted with Brookside Kenya, who gave him further guidance related to milk processing and packaging. However, given the expansion of the product line, the 120 cows weren't enough to produce enough milk to cater for fresh and pasteurized milk. To cover up this gap, 250 Friesian cows were stocked which increased milk production to 8,000 liters per day. To ensure quality and customer satisfaction, product tests and trials were carried out, and feedback gathered was used to improve their dairy products. This continuous adaptation became a culture in the company.

In 1994, Mr. Mulwana registered JESA Dairy Farm Ltd. and started selling pasteurized milk. Having registered success with Nice House of Plastics and Uganda Batteries limited as successful brands, experiences gathered then were modified and used in the distribution of JESA. Existing channels of distribution guided the supply chain of JESA products to customers who were already loyal to the company. Therefore, JESA was bundled with plastics and batteries and also joined the Network of Dairy Milk Producers as a member. In 1996, the company revisited most of its existing policies to ease the penetration of JESA milk to the market. This allowed the use of above-the-line marketing strategies. As a result, the first marketing campaign was launched with the main theme "fresh from the farm." During the campaign, billboards were

raised to enable top-of-the-mind awareness, distributors were reminded daily to load the new JESA products, and brand ambassadors were staged in the different coffee shops and supermarkets which gave JESA a higher level of recognition among the population.

To further strengthen the bond between the JESA and customers, marketing surveys were conducted to enable customers to contribute to product development and pricing. Promotional strategies were also a result of trial and error methods that facilitated learning through addressing customer complaints. This made several customers develop positive attitudes and beliefs that JESA products were superior in the market which increased consumption of these products. This motivated Mr. Mulwana to increase farmland to 600 hectares, increased Friesian cows to 550, and identified 12 outgrowers who were given Friesian cows and vaccines and trained on how to maintain standards as required. This further increased milk production and formed the basis of venturing into more products like yogurt, butter, flavored milk, cream, and cheese. Given that all outgrowers were trained and equipped with production skills, JESA products maintained the same fresh test that impressed most customers.

JESA was later certified by the ISO food safety standard, the UNBS Q mark, and the Uganda Halal Bureau. These certifications created more confidence among customers and enabled the company to enter into international markets through Newrest Inflight Services which supplies JESA products to leading airlines like KLM, Ethiopian, Brussels, and Rwanda Airlines.

Today, the company's sales stand at 100,000–120,000 liters a day with a distribution network of 270 actors with most customers emotionally attached to JESA, and to many, without JESA there is no milk. This is as a result of the belief in product quality, performance, and superiority of the brand which has enabled it to be in every household in Uganda. Currently the company enjoys market leadership in fresh milk, pasteurized milk, yogurt, and butter with a 75% market share, and it is a favorite brand in sub-Saharan Africa (*source: JESA Dairy LTD Records 2019, Uganda Dairy Products Market Outlook Report 2019*).

## Discussion and Implications

An examination of the JESA story facilitates a deeper understanding of the concept of consumer-based brand equity and processes that lead to its formation. The story displays how the company was able to build a strong JESA brand in Uganda that has become a household item in sub-Saharan Africa. From the story, an attempt is made to probe, evaluate, and deduce the concepts attached to the underlying ideas and move on to the discussion of passive and reflective constructions of consumer-based brand equity and generate a theoretical justification of the process of building a consumer-based brand. A number of constructs that are taken as measures of consumer-based brand equity have been derived from the JESA story and discussed using the unified theory of brand equity (Aaker 1991; Keller 1993; Nebojsa et al. 2015). The theory bases its teachings and assumptions on the early discussions on branding by notable authors, including the likes of Copeland (1923). According to these authors, the buyer is reluctant to buy a product if there is no recognizable brand name by the manufacturer in good standing. Later authors like Gardner and Levy (1955) have stipulated that a brand is embedded within a complex symbolism that represents a variety of attributes and ideas, and brand names are thus much more than mere labels that distinguish between products and allow consumers to tell them apart in the context of complex buying situations. Gardner and Levy (1955) have argued that a brand summarizes sets of ideas, feelings, and attitudes that the consumer has about an organization or the products it brings into the market. Based on the perception of these elements, consumers then make choices by picking one or a few elements from within these sets that they find most appropriate (Park and Srinivasan 1994). The theory advances the concept of consumer-based brand equity and indicated that it occurs when a consumer is familiar with a brand and has already developed some

favorability or strong associations with the brand (Keller 1993). This favorability is what translates into sales, market share, and profits for the organization which later results into the formation of brand value (Ozdemir et al. 2020). In relation to this, Aaker (1991) and Keller (1993) conceptualized consumer-based brand equity in form of brand awareness, brand associations, brand loyalty, and brand perceived performance as components that explain the rationale why consumers buy products from given firms. Using the assumptions of this theory, ontological variants of consumer-based brand equity among beverage manufacturing firms are derived from the JESA story.

## Ontological Variants of Consumer-Based Brand Equity Among Beverage Manufacturing Firms in sub-Saharan Africa

The JESA story shows that consumer-based brand equity is an observable phenomenon, and a number of constructs are witnessed as advanced by Nebojsa et al. (2015), and among them include brand awareness, brand perceived performance, brand loyalty, brand preference, and brand associations. A detailed analysis of these is provided below.

### Brand Loyalty

The success story of JESA demonstrates that brand loyalty is an indicator of consumer-based brand equity as portrayed in the proprietor's actions of bundling JESA products with Nice House of Plastics and Uganda Batteries limited that were already successful brands with a network of loyal customers. Given that the proprietors had loyal customers with the other lines of business, it becomes easier for them to understand and accept the JESA products. Therefore, the level of brand loyalty and attachment that consumers had with the Mulwana's products on the market created a strong base for the success of JESA products. This purely shows an association between brand loyalty and consumer-based brand equity implying that firms that may need to measure the level of consumer-based brand equity among their customers may depend on the level of brand loyalty.

In support of the findings from this success story, Aaker (1991) indicated that one of the core measures of brand equity is brand loyalty and explained brand loyalty as the extent to which a consumer constantly buys the same brand within a product category (Lassar et al. 1995); in the process, the consumer remains loyal to a specific brand as long as it is available. In addition, brand loyalty exists when the consumer feels that the brand consists of the right product characteristics and quality at the right price (Ekinci and Whyatt 2011). Therefore, even if the other brands are available at a cheaper price or superior quality, the brand loyal consumer will stick to his brand. Brand loyal consumers are the foundation of an organization since greater loyalty levels lead to less marketing expenditure (Ha et al. 2011) and acts as a means of launching and introducing more products that are targeted at the same customers and restrain new competitors in the market (Raju et al. 1990). Brand loyalty can be developed through various measures such as quick service, ensuring quality products, continuous improvement, and wide distribution network (Appiah 2014) which tallies well with the JESA case study where Mr. Mulwana was committed to continuously improve and consistently use the existing networks of plastics and batteries to increase the visibility of JESA products. Furthermore, Raju, Srinivasan, and Lal (1990) suggest that as brand loyalty increases, customers will respond less to competitive moves and actions. It implies that brand loyal customers will always remain committed to the brand, are willing to pay a higher price for that brand, and will promote their brand always which strengthens the consumer-based brand equity of the firm.

### Brand Perceived Performance

The other component of consumer-based brand equity that is evident in the JESA success story is brand-perceived performance. In the success story, the product tests and trials that were conducted with customers created the feeling of trust and perceived performance of JESA products. Customers that tested the JESA products felt proud for being consulted and provided feedback that was used to improve the quality of the

products. This was done continuously and ultimately resulting into positive beliefs towards the firm. In the same way, the firm strengthened the bond with customers through addressing their complaints. This process possibly made customers feel that the firm is empathetic and is committed to providing improved products on the market. As a result, marketing surveys were conducted to enable customers to contribute to product development and pricing and promotion. These surveys also facilitated learning and transformational processes of JESA products. Such efforts created a feeling of involvement and emotional attachment to JESA products.

The JESA case study further indicates that continuous training of production teams and outgrowers enabled consistency in the quality of the milk that was produced. Given that all outgrowers were trained and equipped with production skills, JESA products maintained the same fresh test that impressed most customers. Therefore, this impression of high-quality products facilitated the positive belief in the JESA products which is an indicator of consumer-based brand equity. In addition to the above, JESA certification by the ISO food safety standard, the UNBS Q mark, and the Uganda Halal Bureau created more confidence and believability in the company products. Subsequently, this certification enabled JESA to enter into international markets through Newrest Inflight Services which supplies JESA products to leading airlines like KLM, Ethiopian, Brussels, and Rwanda Airlines. Therefore, the presence of JESA on international shelves and being served on international airlines was a sign of perceived performance among the existing and potential customers.

In support of the above, literature is littered with evidence to back up brand perceived performance as an indicator of consumer-based brand equity. In reference to the unified theory of brand equity (Nebojsa et al. 2015), brand perceived performance is among the elements that were used to measure consumer-based brand equity. Nabojsa explained brand perceived performance as the extent to which a brand is considered to provide a good-quality product, and a good-quality product was measured on the dimensions of product features, product reliability, customer service, style and design, and pricing of the product or service. In the JESA case study, the features like freshness, customer engagements, and consumer-based pricing methods were elements that portrayed the perceived performance of the brand. Furthermore, Aaker (1992) advanced the view that brand perceived performance provides value to consumers and ultimately becomes the main reason to buy. Firms with high levels of brand perceived performance enable consumers to differentiate their products and form the basis for line extensions. In other words, brand perceived performance is the consumer judgment about the brand and subsequently contributes to consumer-based brand equity.

### Brand Awareness

The success story of JESA presents the concept of brand awareness as a prerequisite for brand recognition and ultimately consumer acceptance. In the story, the actions of the proprietors to revisit the company policies and accommodate above-the-line marketing strategies to ease market penetration of JESA milk to the market resulted into a number of marketing efforts that intended to change the consumer's mindset. These marketing efforts included advertising, regular reminders to distributors, use of brand ambassadors, and market activations, among others. Such efforts gave the consumers the ability to recognize the JESA brand and also created the feeling of association to the brand. In the same regard, the actions of moving JESA milk alongside Nice House of Plastics and Uganda Batteries that were already successful brands on the market and had accumulated a higher level of awareness among the masses gave an opportunity to JESA to be easily known, trusted, and recognized. That level of recognition amplified the believability of the JESA brand among the masses resulting into accelerated consumer-based brand equity.

In support of these actions, the unified theory of brand equity also advanced brand awareness as a measure of consumer-based brand equity with an emphasis on the knowledge the consumer has about the brand and in the ability to reminisce the attributes of that brand. This assertion is similar to

the arguments of Yoo and Donthu (2001) who indicated that brand awareness is the strength of a brand's presence in a consumer's mind, and the higher the level of awareness, the more the consumer is attached to the brand. Additionally, Keller (1993) explained consumer-based brand equity in four different forms which are all evident in the JESA story, and these included recognition, recall, top of mind, and dominance. Recognition involves remembering past exposure to the brand. Although the customer may not remember the product or category associated with the brand, recognition is important because it results into more positive feelings towards the brand. In the JESA story, the marketing campaign was run mainly to increase the level of brand recognition among the masses which was achieved. Brand recall, top-of-the-mind awareness, and brand dominance were evident in the JESA story at the point where customers became emotionally attached to JESA brand and to a number of customers, without JESA meant absence of milk. Such level of attachment to JESA brand was a result of the brand awareness activities that were implemented which greatly improved the company's consumer-based brand equity.

### Brand Preference

Another component of consumer-based brand equity that is pronounced in the JESA story is brand preference. The story shows that JESA enjoys market leadership in fresh milk, pasteurized milk, yogurt, and butter with a 75% market share in Uganda and among the most favorite in sub-Saharan Africa. This means that customers prefer the JESA brand to other competition brands in the industry. In addition, the sales figures of JESA and a wider distribution network are a sign of a high rate of usage and preference of the product in its category. This is further confirmed by the assertion that JESA is in most households in Uganda and to most customers, the absence of JESA means an absence of milk on the shelves. In line with the above, Baalbaki and Guzmán (2016) concluded that customers are more likely to choose a product from a brand they know and will often prefer using a particular brand if they trust its products and feel its qualities match their needs. Therefore a brand with established consumer-based brand equity will stand out in the market against its competitors because of its preference.

### Brand Attitude

The JESA story also indicates that brand attitude is a major component of consumer-based brand equity. In the story, it is clear that efforts towards making customers understand the attributes of the JESA brand facilitated a change in consumer mindset and formation of positive attitudes towards the brand. These attributes included freshness that was pronounced in the campaign slogan of "fresh from the firm" that caused more believability in the JESA products since most pasteurized milk products on the market were imported and never tested fresh. Furthermore, the proprietors of JESA focused on maintaining the same quality of milk on the market through identifying, training, and supporting outgrowers with the aim of maintaining the same standard and attribute of freshness in taste for JESA products. In the same regard, JESA was certified by the ISO food safety standard, the UNBS Q mark, and the Uganda Halal Bureau. These certifications also were intended to communicate the attribute of quality in relation to JESA products. This certification was used to enter into international markets through Newrest Inflight Services which supplies JESA products to leading airlines like KLM, Ethiopian, Brussels, and Rwanda Airlines. JESA's existence in international markets communicated the position of superiority, excitement, and willingness to associate with JESA products which accelerated its consumer-based brand equity. In support of this, Chang and Liu (2009) explained brand attitude as the overall gratification, evaluation, and liking of a brand, and it's characterized by the thoughts and feelings that a consumer holds about that brand. Similarly, Keller (1998) considered brand attitude as a function of brand attributes and benefits. In this case, perceived attributes and benefits, deriving from functional and experiential knowledge, form an overall evaluation of the brand in the consumer's mind, and this judgment is based on salient associations. This means that in measuring consumer-based

brand equity, brand attitude is an important component which originates from the consumer perception and interpretation of brand attributes.

Furthermore, Ajzen and Fishbein (1975) added that brand attitude is formed based on the consumer's salient set of beliefs about the brand and consumer perceptions of attributes associated with its benefits (Berger and Mitchell 1989; Dick and Basu 1994; Kotler et al. 2015; Keller 1998). In the JESA story, consumer's salient set of beliefs about the brand were evident in the freshness of JESA milk, international, and Halal certifications. These attributes communicated a position of superiority upon which consumers developed a positive attitude about the brand. Likewise, Ajzen and Fishbein also emphasized the importance of marketing communication and its influence on brand attitude since its main aim is to attract consumer attention. Therefore, the way consumers perceive the brand either favorably or unfavorably can be influenced or reinforced by the way the brand communicates to them (Ajzen and Fishbein 1975; Paproski 2012). In relation to JESA, it is clear that the formation and promotion of the JESA brand were meant to create a favorable opinion about the product and ease communication against the nonbranded milk products that were sold before. This kind of strategy is visible in the JESA fresh from the firm campaign that strengthened the feeling of favorableness towards JESA products. Therefore, JESA marketing communication efforts embedded with product trials were at the forefront of the formation of a strong brand attitude towards JESA products that resulted into a strong consumer-based brand equity for JESA.

Conclusively, the application of the unified theory of brand equity and the interrogation of the JESA story enabled the presentation of a mind map for consumer-based brand equity in Fig. 1 below.

## Relationship Patterns and Antecedents of Consumer-Based Brand Equity as Derived from the JESA Story

This paper uses the action regulation theory to develop constructs of social-environmental analysis, error management, transformation of rules, and customer bonding that preceded the formation of strong consumer-based brand equity for the JESA brand. These constructs are discussed as depicted from the story followed by the relationship patterns that exist among them.

### Social-Environmental Analysis Actions

Among the core elements of the action regulation theory is the analysis of the social context (Rauch and Frese 2007). Frese indicates that, when the focus of action regulation is on the social context, past, current, and expected interactions with other people, it eases the process of goal development and selection, mapping the environment, and planning and monitoring of execution. Frese and Zapf (1994) further argue that most tasks are done within a social setting particularly businesses and entrepreneurs that are oriented towards the market. In addition to the above, to effectively have tasks implemented within a social setting, Frese et al. (2000) emphasized the importance of planning to overcome uncertainty within the social environment and by actively influencing the environment rather than by only reacting to the environment. Therefore firms that are looking towards establishing reliable and believable empires need to consider a critical analysis of the social environment.

The JESA story shows that the proprietors were actively involved and interacted with milk retailers, customers, and other actors in the social environment both locally and in the neighboring countries to enable the firm to get a solution to the 150 liters of milk that used to get spoilt on a daily basis. Through these interactions, the idea of pasteurized packed milk and venturing into other milk products emerged. To actualize the production of pasteurized packed milk, the interaction with Brookside Kenya was of great importance especially in the processing and packaging of the product. Furthermore, market surveys were conducted to solicit for customers' views on the required improvements in the product. Such actions constituted a social-environmental analysis that was fundamental in the formation of the JESA brand.

**Consumer-Based Brand Equity Among Beverage Manufacturing Firms in Sub-Saharan Africa, Fig. 1** Mind map for consumer-based brand equity

### Error Management Actions

Further analysis of action regulation theory shows that people and organizations are active learners and that the development of knowledge and skills within an organization requires learning from errors (Frese and Keith 2015; Frese and Zapf 1994). In this regard, the theory pronounces continuous detection and correction of errors, learning, training, empowerment, and systematic usage of feedback from customers as core elements of an effective error management culture in organizations (Frese et al. 2003). In the JESA story, a number of these error management practices were observable as precursors of consumer-based brand equity. Evidence from the story shows that proprietors of JESA were ardent on the reduction of errors in the production process. To effectively achieve this, product tests and trials were carried out, and feedback gathered was used to improve the quality of products. Furthermore, trial and error methods facilitated learning through addressing customer complaints, and from these back and forth processes, effective promotion and communication strategies for

JESA emerged. In addition, the processes of equipping outgrowers with the same production skills through training were intended to avoid errors and ensure consistency in the production of milk with the same fresh taste that impressed most customers.

### Transformation of Rules

Continuous transformation and adaptation are among the underlying principles of action regulation theory. The theory assumes that, through reactions, and interactions with the environment, organizations adapt and improve performance (Frese and Sabini 1985). This enables organizations to develop action-oriented plans and transformation procedures that turn the plan into expected results. Zacher and Frese (2018) referred to this as a process of continuous transformation of rules that calls for adaptation and recognition of the changes in the environment to create a suitable identity. Furthermore, Neal, Ballard, and Vancouver (2017) indicate that organizations that strive to continuously transform their rules often have to flexibly manage multiple competing demands to enable them to avoid the undesired outcomes. To achieve this, action-based marketing practices are important tools in driving the change and create positive and favorable attitudes about the brand (Saenko et al. 2016). The purpose of this continuous transformation is to create a favorable brand image and attach the value that is relevant to consumers.

A critical review of the story of JESA reveals that a number of actions were undertaken by the proprietors of the business to facilitate a continuous transformation of rules. The success story shows that in an effort to grow the dairy business and establish a formidable brand, several transformations were made. As indicated in the story, in 1994, the proprietors registered JESA Dairy Farm Ltd. for the purpose of creating an identity in the market and enabling consumers to differentiate the company milk products from other competitors. It is under this brand name that the company started selling pasteurized milk. In addition, adjustments and transformations were made in the distribution channels by bundling JESA with an already successful brand of Nice House of Plastics and Uganda Batteries limited. This product bundling enabled customers to attach the same value to JESA products as they did to Nice House of Plastics and Uganda Batteries limited. More transformations and changes were made in the marketing practices of the firm which included above-the-line marketing strategies like running organized campaigns and below-the-line marketing strategies like the use of brand ambassadors and market activations. Such changes moved JESA close to the final consumer which resulted into more positive perceptions about the brand. Later on, JESA transformed its products into internationally accepted products through certifications with ISO food safety standard, the UNBS Q mark, and the Uganda Halal Bureau. These certifications created more confidence among customers which qualified JESA's entry into international markets.

### Bonding

Bonding with customers is a strategic effort to create relationships beyond initial transactions that transforms customers into advocates (Rives et al. 2013). Therefore, manufacturing firms have put much emphasis on customer bonding as a strategy of creating customer loyalty since loyalty is a reliable measure of consumer-based brand equity (Keller 2013). Previous scholars have argued that achieving high levels of customer bonding is driven by a number of actions not limited to understanding and providing what customers want (Cowan 2018; Heinberg et al. 2018) quickly responding to errors and responding to customer complaints, adaptation to customer needs, and ensuring customer satisfaction (Rives and de Maya 2013). These actions are rooted in the action regulation theory which further confirms that achievement of organizational goals is accelerated by the bond that exists between the organization and its customers (Frese and Zapf 1994).

Examining the JESA story reveals that a number of actions were planned to enable customers to understand the company offerings and also strengthen the bond between JESA and customers. In this regard, circumstances that demonstrated the concept of bonding in the JESA story

included the ability of customers to provide unconditional feedback from the market. This feedback was regularly responded to which further improved the relationship between the two parties. Furthermore, it appears in the case study that most customers are emotionally attached to JESA. This emotional attachment is as a result of the trust and closeness between customers and the firm.

## Discussion and Establishing Relationships

### Social-Environmental Analysis Actions, Transformation of Rules, Bonding, and Consumer-Based Brand Equity

The JESA story shows that social-environmental analysis actions, transformation of rules, and bonding are core antecedents of consumer-based brand equity in a manufacturing setting. This movement first summarized the event listing matrix shown in Table 1 and later on discussed.

The event listing matrix above outlines a number of actions and events under social-environmental analysis, transformational of rules, and bonding that contributed to the formation of a strong JESA brand that exists in sub-Saharan Africa today. These actions and their relationships are discussed below.

A close examination of the actions that contributed to the existing consumer-based brand equity for JESA indicates that proprietors were actively engaged in community participation and business actors in this category were involved and consulted extensively. These consultations were planned with the intention of understanding community needs that enabled the formation of a formidable brand. Among the core actions at this level was working closely with the retailers who provided relevant market information upon which strategic decisions were taken. These strategic decisions included transformation from selling raw milk to pasteurized branded milk and the

**Consumer-Based Brand Equity Among Beverage Manufacturing Firms in Sub-Saharan Africa, Table 1** Event listing matrix for social-environmental analysis actions, transformation of rules, bonding, and consumer-based brand equity

| Events | Social-environmental analysis actions | Transformation of rules | Bonding | Consumer-based brand equity |
|---|---|---|---|---|
| **Event 1** | Pro-activeness in consulting industrial key actors and channel members | Formation of the JESA brand and the start of the journey to pasteurized milk | Customers easily identified with the JESA brand and become more attached to it | Customers became more emotionally attached to JESA and developed a favorable brand attitude |
| **Event 2** | Market surveys were conducted to solicit for customers views on the product, pricing, and promotional methods | JESA marketing practices were transformed to include organized campaigns and brand ambassadors | JESA brand image made the consumer more attached to the brand | Increased perceived performance of JESA Brand |
| **Event 3** | Product tests and trials were carried out, and feedback gathered was used to improve JESA products | JESA milk products were continuously modified to suit customer's taste and preferences | Involvement of customers made them more attached to the firm | Customers believed more in JESA products and considered the rand to be superior |
| **Event 4** | A detailed study on Nice House of Plastics and Uganda Batteries Ltd. distribution channels was done | Existing marketing channels were modified to accommodate JESA products | The firm strengthened their relationship with the existing customers | The use of existing channels increased brand awareness and ease recognition of JESA products |
| **Event 5** | Analyzed and identified the need for certified and Halal products in the market | JESA products were certified by ISO food safety standard, the UNBS Q mark, and the Uganda Halal Bureau | JESA products were more trusted and accepted by customers | JESA products were more preferred on the market and most customers befitted loyalty to the brand |

formation of the JESA brand that created a new identity for the business. The new JESA brand made it easy for customers to identify with the brand and to become emotionally attached to it. This level of attachment explains the favorable brand attitude for JESA and the subsequent consumer-based brand equity as outlined in event 1. These actions are supported by the work of Alvarado-Karste and Guzmán (2020) who investigated the role of brand identity in creating a congruent brand image and also analyzed how social influence – namely, consumers' compliance, identification, and internalization with a brand – affects consumer attitudes and strengthens consumer-based brand equity.

In addition, in event 2 in Table 1 above, market surveys were conducted to solicit for customers' views on product, pricing, and promotional methods that would be appropriate for their products. Such actions of involving customers contributed to a continuous refinement of the product, prices, and marketing campaigns. Furthermore, adjustments in marketing communication aided product demonstration and quality interactions with customers which enabled customers to appreciate the special features of the JESA brand and ultimately improved JESA's consumer-based brand equity. In support of this, Dwivedi, Johnson, Wilkie, and De Araujo-Gil (2019) argue that emotional marketing communication that is more than informative increases the audience's attention towards products and boosts recall, recognition, and attitudes towards the brand. This is further in agreement with Baalbaki and Guzmán (2016) who confirmed that consumer-based brand equity (CBBE) is a function of recall, recognition, and attitudes.

In line with the above, product tests and trials across all product lines of JESA seem to be among the social-environmental analysis actions that contributed to its strong consumer-based brand equity. On a number of occasions, milk products were given out to customers and outgrowers as samples to ensure that they match the desired taste. The feedback that was received after these trials enabled further improvement in the quality of milk that was released for sale. These practices of product testing became a culture in the company which meant that JESA milk products were continuously modified to suit the customer's taste and preferences making customers more emotionally attached to the firm. In this regard, Washburn et al. (2000) argue that positive product trial seems to enhance consumers' belief in the product and eventually consumer-based brand equity basing on the fact that product trials represent tangible evidence to determine a consumer's equity and perception. Therefore, experience gained after sampling the product augments the consumer's perceptions rather than forcing the consumer to rely on the brand name alone as a signal of quality.

Furthermore, through environmental analysis, a detailed study on the distribution channels of Nice House of Plastics and Uganda Batteries limited was done to ease the reach to their loyal customers. These channels were therefore modified to allow product bundling which enabled the movement of JESA products together with Nice House of Plastic products and Uganda Batteries. Whereas the three products were in different lines of business, targeting different market segments and satisfying different needs, selling milk alongside products that had a bigger brand name created positive perceptions and attitude towards the JESA brand and ultimately strengthened its consumer-based brand equity. Literature indicates that tying two products of unequal value makes them equally valuable as they become inseparable for purchase. Consequently, firms can charge a higher price for the bundled products than before (Washburn et al. 2000). This is also supported by Simonin and Julie (1998) who concluded that product bundling increases product believability and equity among consumers and it is necessary in introducing new products.

Lastly, event 5 in the matrix Table 1 shows that proprietors analyzed and identified the need for certified and Halal products in the market as a result of the international business regulations that call for certification of products that are going oversee and need for a Halaal certificate for food and beverages. In a bid to satisfy these requirements, JESA products were certified by ISO food safety standard, the UNBS Q mark, and the Uganda Halal Bureau. These certifications made these products more trusted and acceptable culturally and internationally. The certification

also increased consumers' trust, believability, and loyalty to the brand. To this effect, Keller (2013) and Keller and Lehmann (2006) advanced the view that the power of a brand relies upon what customers think, feel, and trust which gives value to a brand and strengthens its consumer-based brand equity.

### Error Management Actions, Transformation of Rules, Bonding, and Consumer-Based Brand Equity

The JESA success story assumes that a manufacturing firm in sub-Saharan African can achieve the desired level of consumer-based brand equity through error management actions, transformation of rules, and bonding. This is summarized the event listing matrix Table 2 followed by a discussion establishing relationships among the constructs.

In reference to Table 2 event 1, error management actions were observed through giving of Friesian cows, vaccines, and training to outgrowers. These actions solved the challenge of the poor quality of milk that was largely a result of mixing up of milk from different outgrowers with different quality standards. Several trainings were conducted to equip outgrowers with the required skills to enable them to produce the same quality of milk with the same great taste. As a result, this same great freshness taste of JESA made several customers fall in love with the product which made customers prefer JESA products to other milk products on the market. Such actions that were undertaken are consistent with action regulation theory which suggests that training and learning turn average workers into super workers who have superior knowledge and skills to undertake their tasks (Hacker 1985). These super workers are also more sensitive to signals from the environment and perceive signals and differences between signals as well as errors more accurately (Hacker 1985). The implication of this is that firms with employees that have a deeper understanding of tasks can easily provide what consumers want which makes them believe in the firm and subsequently strengthen its consumer-based brand equity.

In addition, events 2 and 3 demonstrate that receiving customer complaints and conducting trial and error activations are important strategies that facilitate learning and improving service delivery. This is because trial and error activations ease product demonstrations and acquisition of immediate feedback. In support of this,

**Consumer-Based Brand Equity Among Beverage Manufacturing Firms in Sub-Saharan Africa, Table 2** Event listing matrix for error management actions, transformation of rules, connectedness with customers, and consumer-based brand equity

| Events | Error management actions | Transformation of rules | Bonding | Consumer-based brand equity |
|---|---|---|---|---|
| **Event 1** | Errors were avoided through giving Friesian cows, vaccines, and training to outgrowers | Outgrowers were skilled which enabled them to produce milk of the same great taste | The same great freshness taste of JESA made several customers fall in love with the product | Customers preferred JESA product over other products on the market |
| **Event 2** | Trial and error methods facilitated learning through addressing customer complaints | Customer complaints were addressed that improved in service delivery | Customers were satisfied with JESA products | Customers became attached and loyal to JESA products |
| **Event 3** | Continuous adaptation to customer needs | JESA milk products were continuously modified to suit the customer's taste and preferences | Involvement of customers made them more attached to the firm | Customers believed more in JESA products and considered the brand to superior |
| **Event 4** | Feedback was gathered on the effective promotion and communication strategies | More interactive promotion methods were used | Customers interacted more with JESA staff | There was a high level of bonding between customers and JESA staff |

**Consumer-Based Brand Equity Among Beverage Manufacturing Firms in Sub-Saharan Africa, Fig. 2** Consumer-based brand equity variants and antecedents: a conceptual framework

Heimbeck, Frese, Sonnentag, and Keith (2003) indicated that error management and training encourage participants to learn from errors through exploring the causes and dynamics behind these errors. This continuous error detection and correction enables the firm to continuously adapt to customer needs and continuously modify its process to suit customer tastes and preferences. Despite the above, error detection and correction processes also accelerate customer involvement and strengthen the bond between the firm and its customers.

Following the above discussion, it can be concluded that in a beverage manufacturing setting as demonstrated in the JESA case study, social-environmental analysis, error management actions, transformation of rules, and customer bonding constitute the antecedents and variants of consumer-based brand equity. This argument is summarized in the conceptual model as shown in Fig. 2.

## Conclusions

The model above brings together constructs and/or metaphors derived from the action regulation theory. These constructs have been discussed with the support of the empirical findings from the literature and explaining in part the realities of consumer-based brand equity evidenced in the case study of JESA Ltd.

## Conclusion and Implications

### Conclusions

A thorough and critical analysis of the success story of JESA using the unified theory of brand equity reveals that brand awareness, brand perceived performance, brand loyalty, brand attitude, and brand preference are the ontological variant of consumer-based brand equity in a beverage manufacturing setting.

Application of the action regulation theory to the story of JESA also illustrates that the antecedents of consumer-based brand equity in a manufacturing setting include social-environmental analysis actions that were observed through pro-activeness, market surveys, product tests and trials, and error management actions that were observed through feedback mechanisms responding to customer complaints, flexibility, training, and error detection. Also transformation of rules was an antecedent of consumer-based brand equity among the manufacturing firms in sub-Saharan African that was observed through continuous adaptation, identity formation, and

action marketing practices. Conclusively, bonding was observed through relationship building, trust, and emotional attachment. The implication of this is that firms that are attempting to develop a favorable consumer-based brand equity need to interact regularly with customers and create an appropriate error management culture that allows continuous adaption to customer needs which ultimately strengthens the bond between the firm and its customers and subsequently builds a favorable consumer-based brand equity.

### Policy Implications

The paper recommends that regulators need to emphasize the role of environmental analysis and market surveys as methods through which beverage manufacturing firms can strengthen their existence in the market. This is because continuous environmental analysis and market surveys enable beverage manufacturing firms to understand and appreciate consumer needs and procedures of satisfying these needs. As a result, satisfied consumers become more attached to the firm which is an element of consumer-based brand equity.

Policy makers also need to supervise the existence of feedback mechanisms in organizations that facilitate error detection and correction. These mechanisms may be supported by equipping employees with the required skills through training to enable them to produce the required products and services.

### Theoretical Implication

This paper was anchored on the teaching of action regulation theory (Frese and Sabini 1985) and unified theory of brand equity (Aaker 1991; Keller 1993; Nebojsa et al. 2015). Unified theory of brand equity was used to derive the variants of consumer-based brand equity while action regulation theory was used to derive the antecedents of consumer-based brand equity. Action regulation theory argues that actionable activities in an organization are goal oriented and that they produce better results for the organization if they are well planned and aligned. In this study, the theory was used to examine the social-environmental analysis actions, error management actions, transformation of rules, and bonding action in the JESA story that seemed to be vibrant antecedents of consumer-based brand equity. This implies that interpretive philosophical perspective and case study analysis can be useful in understanding organizational practices that contribute to consumer-based brand equity.

Furthermore, the interpretive philosophical perspective was preferred because of the desire to have an in-depth understanding of organizational actions that are important in building strong consumer-based brand equity for the firm. This was necessary because consumer-based brand equity is an objective constructed by social interaction between the firm and its customers (Sarantakos 2005). The paper therefore undertook a task to examine the actions that lead to consumer-based brand equity among manufacturing firms in sub-Saharan Africa. In developing the success story, secondary data was gathered from the records of JESA Dairy Ltd., and also the current directors in the company were interviewed given that the original proprietor of the business had already passed on.

# Contemporary Civil Service Reforms in Japan

Takashi Nishio
Department of Politics and International Studies, International Christian University, Mitaka, Japan

## Synonyms

Reforms in the human resource management in Japan; The Japanese civil service; The political control of the Japanese bureaucracy

## Definition

The political and administrative reforms related to the civil service system and personnel management in Japan from the mid-1990s to 2020.

## Introduction

Modern Japan underwent at least three major civil service reforms. The first was the introduction of a modern examination and personnel system for public service based on a merit principle in the late nineteenth century. The second was the postwar civil service reform initiated by the General Headquarters of the Allied Forces (GHQ) as an important part of the constitutional reform in 1947, through which the Emperor's bureaucrats were regarded as "servants of the whole community" (article 15, the Constitution of Japan). The third reform started in the mid-1990s and lasted until the establishment of the Cabinet Bureau of Personnel Affairs in 2014, but the political and administrative adjustment to the new system is continuing. This article focuses on the third, ongoing reform.

While the postwar civil service reform was fundamental in terms of democratization and in the words of the constitution, some parts of the prewar Japan's bureaucratic system survived because the GHQ adopted the "indirect rule" to implement their occupation policies. For example, the privileged entrance selection system, in which the category of the examination for service matters throughout the career of each official, continues even now. In so-called "career system," those fast streamers who passed the type 1 examination will be promoted much higher than other categories, including technical officials, without receiving strict check about their real abilities or achievement (Kawate 2005).

As the tradition of closed, decentralized personnel system by each ministry has not undergone a radical reform, the pathology of compartmentalism and weak coordination by the cabinet has been a long-lasting issue. The establishment of the National Personnel Authority (NPA) as an autonomous, authoritative administrative committee in 1948 was expected to overcome this problem but the other ministries continued the decentralized and closed appointment system.

The need for civil service reform has been discussed repeatedly since around 1960. The Provisional Commission for Administrative Reform (PCAR or *Rincho*, 1961–64) emphasized the importance of civil service spirit but the people did not take it seriously because of the successful economic growth by Ikeda Administration. The second *Rincho* (1981–83) submitted five reports including proposals for a more efficient and slim government, but the major reform was the privatization of the three public corporations: the National Railways, the Telegraph and Telephone Public Corporation, and the Tobacco and Salt Public Corporation.

One of the most remarkable events with the civil service system in the 1980s was the freezing of the NPA's recommendation to raise the civil service compensation. Since the recommendations had been fully implemented for more than 20 years, it was an unusual, controversial political decision by Suzuki Administration. However, considering the popular sentiment against public officials in those days, it might be a responsive political action to the people's criticism to the autonomous administrative practices. The Japanese civil service system could no longer enjoy constant increases of the budget, staff, and compensation.

After the second *Rincho,* four advisory commissions for administrative reform were established to continue and supervise the ongoing reforms until mid-1990s, but actual reform movement did not start without strong public supports and political leadership. The third civil service reform was initiated by Prime Minister (PM) Hashimoto, who established two advisory commissions, the Civil Service System Study Group (1997–99) and the Administrative Reform Council (1996–98), and Hashimoto appointed himself the chair of the council.

## Corruptions, *Amakudari*, and the Ethics Act

Foreign scholars used to associate the Japanese public servants with integrity, dedication, and

high policy competency in relation to the postwar rapid economic growth (Kim et al. 1995). The Japanese government could recruit the best and brightest college graduates with relatively low salaries and have them work indefinitely for the development of the country. However, when the economic bubble burst in the early 1990s, corruptions, wastefulness, untransparent decision-making, and weak responsiveness of the bureaucrats were revealed to the public.

The most striking occurrence was the arrest of the administrative vice minister of the Welfare Ministry on charge of bribery in 1996, but it turned out to be just a case in a series of scandals of higher officials in various ministries. Although the government issued notifications concerning official discipline enforcement, scandals never stopped because acceptance of gifts or treatment from related companies was a daily custom in the public official's life.

PM Hashimoto insisted on the need for formal ethical disciplines for public officials and the National Public Service Ethics Act was enacted in 1999. It stipulates the officials' duty to submit reports concerning acceptance of gifts or treatment exceeding 5,000 yen or on share dealings. The National Public Service Ethics Board was established in the NPA to set the disciplinary standards for violation and to offer opinions concerning the ethics code to the cabinet.

The target of people's criticism to public servants shifted from the treatment corruptions to so-called "descent from heaven" (*Amakudari*), which means retiring bureaucrats taking high positions in related companies. Since the number of executive positions decreases toward the top, the administrative vice minister, "career" bureaucrats are expected to voluntarily leave their ministries in their mid-50s and need to find jobs for life. The personnel section of each ministry's secretariat must find their new positions in the private sector because very few bureaucrats wish to retire before 60, the official retirement age. However, not all companies are willing to accept outsiders, even though they are competent, without such profits as receiving public work orders or special consideration from the ministry. The National Public Service Act stipulates the regulations concerning re-employment by the NPA, but they were not necessarily strict.

This "up-or-out" practice had been deeply rooted in the personnel management system of each ministry (Inatsugu 1996). As early retirement means losing in the promotion race and no one happily leaves the office, each ministry must prepare and mediate nicer positions outside the government for retiring officials to compensate their long service and commitment. However, the custom of *Amakudari* looked unfair, untransparent, wasteful, and corrupt for ordinary citizens. Both the ruling parties, the Liberal Democratic Party (LDP) and Komeito, and the opposition parties openly criticized *Amakudari,* but since there were a number of ex-bureaucrat politicians in both the LDP and opposition parties, the actual reform of this practice was slow and cautious.

It was the first Abe administration (2006–07) that tried to abolish the *Amakudari*. Through the revision of the National Public Service Act in 2007, the ministry's mediation for re-employment of incumbent bureaucrats was prohibited, and instead, the Center for Personnel Interchanges between the Government and Private Entities was established for fairer and more transparent re-employment procedure. However, the center did not function as expected and the informal mediation by each ministry did continue for both incumbent and retired bureaucrats. It became a hot political issue again after the change of the governing party in 2009.

Through the corruption and *Amakudari* issues the Japanese citizens recognized the importance of political leadership for civil service reform (Nakamura 2005). As the LDP collaborated with the bureaucracy for more than half a century, people's expectation for a change in the governing party was rising gradually. But a radical change in the civil service system required a consensus between the politicians and the bureaucrats.

## Consensus Building and the Basic Act of 2008

The third civil service reform was initiated by PM Hashimoto who came into power in 1996, but it

took nearly 20 years to establish the Cabinet Bureau of Personnel Affairs in 2014, which was an epochal event of the change in the politics and administration relations. From Hashimoto administration to the second Abe administration (2012–20), 11 cabinets coped with the reform. This lengthy consensus building processes can be divided into two periods: from the mid-1990s to the enactment of the Basic Act on Reform of National Public Service System in 2008 and thereafter. During the first half period, in 2001, the central government organizations were restructured from 22 to 12 ministries and agencies based on the report of the Administrative Reform Council under the leadership of PM Hashimoto. It was called a reform of the "container," and the civil service reform, a reform of the "spirit" to fill it in, was expected to follow.

In the 1999 Report of the Civil Service System Study Group, a common understanding with the reform direction was confirmed: to enhance openness, diversity, transparency, competence, and to respect for independent will of each official. The next step was the establishment of the Civil Service Reform Office in the cabinet secretariat in 2001, which submitted the fundamental principles (*Taiko*) within a year. While it proposed a new staff evaluation system, a change in the re-employment regulations, and an examination reform, its underlying intention was to revoke the NPA's authorities as a third-party organization. In spite of its seemingly innovative wordings, the fundamental principles were trying to keep the traditional practice of *Amakudari* and the "career" system.

Scholars and mass media criticized not only the content of the fundamental principles but also its untransparent decision-making processes. The core members of the Reform Office were the officials of the Ministry of Economy, Trade and Industry (METI, former MITI), and their proposals were quite different from the directions indicated by the study group. But as the top priority of the reform by Koizumi administration was privatization of the postal service, the fundamental principles of the civil service reform were not developed to an actual enactment.

After Koizumi administration, which successfully realized the postal privatization, the first Abe administration restarted the civil service reform in 2006. But having revised the National Public Service Act in 2007, PM Abe stepped down from illness and PM Fukuda succeeded his civil service reform. At that time, the difficulty lied not only in the nature of the reform but also in the "twisted" (flipped) diet: two houses were controlled by different parties. Fukuda administration could not pass many of the cabinet bills, but in 2008 it could finally enact the Basic Act on Reform of National Public Service System by absorbing amendment opinions from the oppositions.

The basic act, having confirmed the superiority of politics over bureaucracy under the parliamentary cabinet system, stipulated the duty of the civil servants to assist the cabinet and the prime minister. For this purpose, the Cabinet Bureau for Personnel Affairs shall be established in a year absorbing some of the authorities of the NPA and the Ministry of Internal Affairs and Communication (*Somusho*). It also stipulates recording of contacts of politicians and higher officials, recruiting more staff with diverse abilities and backgrounds, and new evaluation system based on merit and achievement. However, since the nature of the basic act was a "program law," which provides future reform programs, the actual institutional reform was left to the following administration.

After Aso administration (2008–09), which succeeded PM Fukuda, the ruling party changed from LDP to the Democratic Party of Japan (DP), but all the DP cabinets, Hatoyama (09–10), Kan (10–11), and Noda administration (11–12) failed to pass their bills for civil service reform. As for the reasons, there was a great east Japan earthquake and the Fukushima nuclear accident in 2011, and the "flipped" diet again, but above all, people's expectation for strong political leadership under a stable government gradually withered.

When the DP government came into power in 2009, PM Hatoyama abolished the tradition of the meeting of administrative vise ministers, which had continued for 140 years and regarded as a symbol of bureaucratic initiative. The meeting was just a custom, not a formal system, but

substantially discussed and set the agenda for the next day's cabinet meeting. The DP government criticized that this mutual adjustment process within the bureaucracy had prevented political initiative. However, DP's critical view of bureaucracy prevented the politicians and higher civil servants from cooperating each other. One major reason for another change of ruling party in 2012 was the DP government's failure to develop collaborative relationship between politics and administration.

## The Cabinet Bureau of Personnel Affairs and Abe Administration

The second Abe administration (2012–20) enjoyed popular support from the beginning and was in power until September 2020, which was the longest administration in Japan's constitutional history. It could pass the cabinet bills more smoothly than before and the National Public Service Act and the Cabinet Act were revised as proposed in 2014. The Cabinet Bureau of Personnel Affairs (CBPA) was established and Abe administration started a unified, centralized control of about 600 higher civil servants. While the NPA and some scholars expressed concerns about risks with neutrality of personnel management, those voices did not spread widely.

Under the new system the minister will submit to the CBPA a list of candidates for the positions of deputy director general or higher, and having consulted with the prime minister and the chief cabinet secretary, the minister will appoint the final candidates. Although the formal appointer had been the minister since the postwar reform, actual selection of higher officials was based on peer review within the bureaucracy and the minister or other politicians seldom intervened in such closed, long-term selection processes. It reflected the Japanese political culture of mutuality or groupism, respect for consensus within the ministry and each group, which was criticized as a cause of compartmentalism or vertical siloization (Nishio 2004). The ideal officials in the postwar Japan have been the "servants of the whole community and not of any group thereof," for which the CBPA was expected to function at the top of the government.

As for the political appointee, Japan has had very limited cases for appointment of such outsiders as businessmen or academic (Izumo 2014). Abe administration also appointed close officials from among career bureaucrats, but not from outside. The PM secretaries and assistants to PM, whose initial affiliation is often the METI, are called "PM resident's bureaucrats" (*Kantei Kanryo*), which mean higher officials close to PM. As their policy advices are sometimes more influential than the top officials of each ministry, decision-making process of key policies has changed from a traditional bottom-up style to a more top-down one. Those politically loyal bureaucrats to PM Abe tend to be promoted to higher positions while those critical bureaucrats tend to become silent or obey reluctantly for fear of demotion.

The neutrality, impartiality, and expertise of the civil service was seriously at stake when PM Abe appointed a former diplomat the Cabinet Legislature Bureau Chief in 2013 although he had no work experience at the Bureau. This unprecedent appointment was to force a change of the legal interpretation of the constitution (article 9) to pass a new security bill. PM Abe used his authority over bureaucrats not only for policy issues but also for protecting himself from personal scandals. The Morotomo School problem, which began with an unfair discount of a government-owned property, led to various cover-ups including a large-scale falsification of the official documents of the Ministry of Finance.

Deliberated political appointments by the cabinet for policy initiative are necessary for responsiveness of the government, but when they are used for personal purposes, the outcome will be nepotism, distrust of government, and a divided society.

## Conclusion

In summary the major issue with Japan's contemporary civil service reforms has been the change in politics and administration relationship. Over

the past 20 years political leadership has been strengthened and bureaucratic autonomy has been mitigated, but it is not easy to evaluate how the government has developed its responsiveness. The price of political control over the bureaucracy might have been the civil service neutrality, fairness, and expertise (Shimada 2020). More deliberate, evidence-based policy making is needed to cope with such risks as earthquakes, climate changes, or covid-19.

There are other issues with recent changes in the civil service system. As for openness and diversity, empowerment of women is a pressing issue. At the entrance level, over 35% of new civil servants were women in 2020, but when it comes to the directors or higher level, women's ratio is only 5.3%. While the latter ratio has increased three times for the past 20 years, so-called "work-style reform" and more public supports for childcare are necessary for further improvement.

Regarding transparency, the criteria of the selection process at the CBPA is far from transparent. Rather, the whole decision-making processes in Abe administration became nepotistic and more closed than before. The more the cabinet exercise discretional power in personnel management, more accountability is needed for a responsive government (Nishio 2018). This is also related to the competence and expertise issue. Even in political appointments, there should be more concrete assessment of the candidates' ability, achievement, or integrity by the NPA.

Lastly, increasing turnovers from the government is becoming a serious problem. According to the NPA's survey, the central government is no longer a most attractive workplace for ambitious young people in terms of motivation, fringe benefits, future prospect, or sense of security after retirement (NPA 2017). For the past 30 years, politicians, mass media, and intellectuals have criticized or even bashed civil servants in discussing the civil service reforms. The number of public servants per population in Japan is the smallest in developed countries and their working condition is being deteriorated (Maeda 2014). More evidence-based evaluation and institutional design is needed for a sustainable government.

# Contextualizing Indigenous Entrepreneurship in the United Arab Emirates

Syed Awais Ahmad Tipu and Abu Elias Sarker
Department of Management, University of Sharjah, Sharjah, United Arab Emirates

## Synonyms

Economic development in the UAE; Ethnic entrepreneurship in the UAE; Local population in the UAE; National innovation system in the UAE

## Definition

Indigenous entrepreneurship in the UAE refers to the creation, management, and development of new ventures by Emirati population.

## Introduction

A recent review of the literature (Croce 2017) reveals that the majority of the studies on indigenous entrepreneurship focus on North America, Oceania, Africa, India, Finland, and Pakistan. However, little is known with regard to indigenous entrepreneurship in the Middle Eastern context and in particular in the United Arab Emirates (UAE). The current paper aims to fill this gap in the literature as it examines indigenous entrepreneurship in UAE by taking an integrative dynamic perspective. Indigenous people around the globe face some common problems such as chronic poverty, low educational levels, poor health (World Bank 2011), discrimination, violence, and abuse (Croce 2017). However, the context of UAE is unique, as the indigenous population in UAE do not face the issues which other indigenous population groups normally experience in other countries. UAE indigenous peoples are considered as a socially and economically privileged group (Jones 2017). Shoebridge et al. (2012) contend that contextualization and indigenous specificity are the key factors in the success of government initiatives to support indigenous entrepreneurship. Very few studies explore the specificities of indigenous entrepreneurship and shed light on the related entrepreneurial configurations (Croce 2017). Therefore, the current entry follows a similar approach and contributes to the theoretical discussion of indigenous entrepreneurship by underlining the contextual settings in an Arab context.

## Indigenous Population and Indigenous Contextual Factors

An analysis is required to ascertain how the contextual factors impact the national leadership vision and institutional interventions for indigenous entrepreneurship.

### Demographic Trends

Demographic trends vary considerably among the indigenous populations from one region to another region. According to the World Bank estimate, there are 299 million indigenous people in the world. General trends indicate a high rate of population growth, high levels of child mortality, low life expectancy, early marriage of girls, and lack of access to modern education and health facilities (Hall and Patrinos 2010; World Bank 2011).

### Globalization

The term globalization has diverse meanings. It has implications for state, economy and society (Farazmand 2009). Though the pace of globalization was accelerated in the late twentieth century, its roots can be traced back to a few centuries earlier. It was the European commercial quest that prompted them to establish imperial hegemony over the indigenous populations in different parts of the world (Dell and Houkamau 2016).

There are both pros and cons of globalization for indigenous development. On the positive side, indigenous identity has become a neologism. With the positive roles of the United Nations (UN) and civil society movements, the aspirations to promote and protect the rights of the indigenous peoples have been rejuvenated.

### Economic

Economic conditions of indigenous population have been quite precarious over the years. Different estimates reveal that indigenous people's incomes are worst among the poor except in a few cases, such as in the oil-rich countries in the Middle East. Profound poverty is particularly observed in the Americas, New Zealand, and Australia (Hall and Patrinos 2010).

### Political

The political enabler of indigenous entrepreneurship is of paramount importance. The emancipation of indigenous people hinges on certain political parameters such as sharing or holding state power, political rights to participate in different political processes, and the state of mobilization to pursue their rights.

### Socio-Cultural Norms

Socio-cultural norms have received increased attention for uplifting the entrepreneurial spirit of indigenous peoples (Dana 2015). While some scholars describe them as obstacles to entrepreneurial developments, others attribute them to the false mindset of exogenous intervention. The indigenous populations are diverse in nature and so are their socio-cultural norms.

## Indigenous National Leadership Vision

History is replete with evidence that national leadership occupies an important place in the discourse in socio-economic transformations particularly in the developing world. Leaders have the capability to change the national mood, offer boldness of vision, engage in planned intervention, create opportunities, lead from the front, and make things happen. Jones and Olken (2005) have found that autocratic leaders under certain settings, such as Lee-Kwan Yew of Singapore or Deng Xiaoping of China, had causative influence on the economies of their countries.

## Indigenous Entrepreneurship: Policy and Outcomes

Over the last two decades or so, substantive researches on indigenous entrepreneurship have emphasized different forms of policy interventions and their outcomes (Dana 2015; Hall and Patrinos 2010). As such, various theoretical approaches have been employed in the literature in order to explore indigenous entrepreneurship. Croce (2017) highlights three models of indigenous entrepreneurship, namely the urban indigenous entrepreneurship (UIE) model, the remote indigenous entrepreneurship model, and the rural indigenous entrepreneurship model. The UIE model relates to entrepreneurship which focuses on opportunity orientation and emerges in an urban context, which highlights the availability of infrastructure, information network, technological tools, and business opportunities. The low level of urbanization underpins the remote indigenous entrepreneurship model for which researchers study the experiences and practices of indigenous entrepreneurs through narratives, interviews, and ethnography. Remote indigenous entrepreneurship generally relates to traditions and necessity orientation. The rural indigenous entrepreneurship model includes the features of both UIE and remote indigenous entrepreneurship and combines traditions and modernity.

## Towards an Integrative Dynamic Framework of Indigenous Entrepreneurship

In light of the review of available literature and relevant discussion as noted above, the current entry proposes a conceptual framework as shown in Fig. 1. The proposed integrated dynamic model of indigenous entrepreneurship takes into account the role of the indigenous context in shaping the national leadership vision. This leads towards enacting certain policies targeting the indigenous population, leading to the outcomes determining the success or failure of the policies. More importantly, the feedback loop shows how the outcomes could possibly affect policy effectiveness and shape the leadership vision.

The framework is applied in the context of the UAE. The study has exclusively relied on secondary sources of data and information.

## The Case of UAE

### Indigenous Context of UAE

According to an estimate in 2014, UAE's population was 9.2 million. Of these, 1.4 million were Emirati citizens or nationals (The Quality Assurance Agency for Higher Education 2017). The UAE, a federation of seven Emirates, is an oil-rich country. The discovery of oil in the 1960s and the oil boom in the 1970s heralded a new era for the country. Both the federal and local governments undertook grand projects on infrastructure and social developments. Currently, the GNI per capita is US$ 39,130 (Atlas method) and US$ 74,410 (PPP). In terms of social and

**Contextualizing Indigenous Entrepreneurship in the United Arab Emirates, Fig. 1** Towards an Integrative Dynamic Framework of Indigenous Entrepreneurship

human development indicators, the UAE is also one of the top performers in the world.

### Demographic

The trends in the demographic composition of the Emirati people have not simply been compatible with the burgeoning economic activities. "Emiratis are a minority in their own country, comprising two of every ten in the population" (Al-Ali 2008, p. 1). As economic activities triggered by the oil boom and diversifications increased, so did the inflow of expatriates. Though Emiratis constitute 11.5% of the total population, they make up less than 10% of the active labor force (Daleure 2017).

### Globalization

The urge for establishing a knowledge-based service economy became intensified following the rapid pace of globalization. Globalization has both threats and opportunities. The UAE is one of the few countries that grabbed the opportunities and withstood the threats with well-crafted policies and programs. According to KPMG's 2017 Change Readiness Index (CRI), the UAE was ranked first among the MENA countries for its readiness to change. In the global context, it was third among the 136 countries (Government of the United Arab Emirates 2018).

### Economic

The price of oil has been unstable since the early 1980s, and so economic diversification became a pronounced state policy. The financial crisis during the period of 2007–2010 further bolstered the necessity of economic diversification. The Emirate of Dubai is a case in point. With a low natural resource base, Dubai was hard hit by the financial crisis. The case for economic diversification became well-founded. The UAE has become a hub for wholesale, retail trade, tourism, and a real estate destination. The country has also become prominent in such areas as financial services, renewable energy, and tourism. The UAE has the most diversified economy in the region. The nonoil sector's contribution to the national GDP is around 70%, with the figure expected to swell to 80% by 2021 (Government of the United Arab Emirates 2018).

### Political

The preindependent UAE was a patrimonial society. With the formation of the federation in 1971, the state blended tradition with modernity. Different nomenclatures have been used to characterize contemporary UAE society – neo-patrimonial, rentier, and clientelist (Jones 2017). While many modern values have crept into the UAE society, traditional structure and the informing values

remain quite vibrant in the governing system (Jones 2017; Daleure 2017). There remains unquestionable legitimacy of political leadership which is more akin to Weberian traditional authority (Jones and Olken 2005; Mansour 2018).

### Socio-Cultural Norms

Some studies (Daleure 2017) consider the existing socio-cultural norms as deterrents which challenge activities such as commerce and private sector jobs. However, these researches are not well-founded as there are other reasons for the reluctance of Emiratis to work in the private sector (Ryan 2016; Al-Waqfi and Forstenlechner 2012). Similar reservations have also been echoed by private companies (Al-Waqfi and Forstenlechner 2012). Particularly, on account of the status, compensation, tenure, and other privileges, the first preference of Emiratis is to work in the public sector (Ryan 2016). Moreover, their readiness level is low in terms of working in the private sector (Daleure 2017).

## Indigenous National Leadership Vision in UAE

In the context of the UAE, there is an overlapping of formal and informal institutions. While the statecraft itself is a formal institution, its drivers are the Rulers, the epitome of informal institutions. It means that national leadership has been in the driving seat of the statecraft. This is an almost unique case of how traditional state leadership read the pulse of its people and the global dynamics and acted on these to deliver unique policies and programs for the country.

While in terms of socio-economic parameters, UAE has done splendidly, political leadership has been wary of three issues: growth of local entrepreneurship, nationalization of the workforce, and the preservation of national identity, while remaining open to the rest of the world. It is now proved that in spite of the rapid pace of globalization that may carry an erosion of cultural values, UAE political leadership has demonstrated its prudence in preserving the old national culture.

## UAE Policy and Programs towards Indigenous Entrepreneurship

The UAE's indigenous population has been at the center of the innovation policy. Through the development of indigenous entrepreneurship, UAE leadership aspires to achieve social and economic development of indigenous people.

Two important institutional interventions, such as the UAE Vision 2021 and the UAE National Innovation Strategy, were promulgated at the critical juncture of the UAE political economy. Both documents emphasized self-determination of Emiratis. The UAE Vision 2021 aims at unlocking the potentials of citizens and enabling them to be a driving force of the UAE's economic development.

In the UAE National Innovation Strategy (NIS) adopted in 2015, the UAE's political leadership strongly emphasized that innovation is the future of human investment. The issue of indigenous entrepreneurship is clearly pronounced in the strategy framework.

In line with the UAE Vision 2021 and the Innovation Strategy, numerous policies and programs have been undertaken over the years that illuminate the importance of indigenous entrepreneurship during the last 15 years.

## Outcomes

Despite various initiatives in the UAE focusing on nurturing the entrepreneurial potential of Emiratis, the active participation of Emiratis remains limited in managing established businesses. In this regard, different reports of the Global Entrepreneurship Monitor (Chabrak et al. 2017) mention the rate of established business ownership which relates to the ownership of established businesses for more than three and a half years. In 2011, the rate of ownership of established businesses by Emiratis was much lower (5%) than the average in innovation-driven economies (7.2%). In 2017, this rate increased to 24.3% but dropped to 15.4% in 2018. This inconsistent pattern underlines the lack of long-term commitment in successfully running established

businesses. This also underlines the challenges for firms' survival beyond 3 years of operations which is relevant to economic well-being and creating sustainable employment.

A recent study by the Global Entrepreneurship Monitor (GEM) examines the societal values regarding entrepreneurship in the UAE. Some key findings reveal how the indigenous population in the UAE view entrepreneurship. For example, 76.6% of non-Emirati expats consider that starting a new business is desirable, compared to 65.4% for Emiratis. Further, more non-Emirati expats consider starting a business easier (69.6%) than Emiratis (58%). The study also reveals that the mortality rate of ventures started by Emiratis is higher as compared to non-Emiratis. This indicates that the ventures started by Emiratis were not properly screened and the risk factor was not properly assessed. This high failure rate may cause higher fear of failure among the indigenous population resulting in more adversity towards entrepreneurship (Chabrak et al. 2017). Drawing upon the GEM UAE studies conducted in 2006, 2007, 2009, and 2011, Tong et al. (2012) also conclude that Arab expatriates have higher entrepreneurship rates compared to other nationality groups, including Gulf Cooperation Council (GCC) nationals and Emirati nationals.

## Conclusions

This study finds that the contextual factors significantly vary across the globe on account of the global changes that commenced with colonization by European invaders. This entry contends that the indigenous national leadership vision articulated on the basis of the contextual factors manifests in the framing and implementation of indigenous entrepreneurship which leads to the outcomes – positive and negative.

The outcomes do not give significant tangible results in terms of sustainable indigenous entrepreneurship ventures. This gives the national leadership avenues to rearticulate the vision which should encompass some reform measures including reviewing the social security welfare regime, the incentive structure, educational reforms, and technology use policy. Since the ethos of globalization has also engulfed the UAE, a newer way in the form of developing competence in public governance has to be found. (Farazmand 2009).

# Contingency Model of Reforms in Public Sector Accounting

Susana Jorge[1] and Giorgia Mattei[2]
[1]Research Centre in Political Science (CICP) and Faculty of Economics, University of Coimbra, Coimbra, Portugal
[2]Department of Business Studies, Roma Tre University, Rome, Italy

## Synonyms

Contingency approach for governmental accounting innovations; Financial management reform (FMR) process model; Lüder's model

## Definition

The "contingency model" (Lüder 1992, 1994, 2002) explains reforms in governmental accounting and financial management systems, resorting to several factors making part of the contextual conditions of those reforms. Also used in an a posteriori perspective, it essentially posits an a priori setting, where several factors combine more or less favorably to determine the likelihood of reforms to come to happen. In particular, the model allows to frame the more or less favorable combination of contextual conditions within one country, to conduct the so-called traditional governmental accounting system to change toward performance and resource accounting and budgeting.

The main underlying assumption is that specific contextual variables determine the primary user orientation of governmental accounting and reporting, which, in turn, determines the design of the governmental accounting and reporting system. It is not a causal relation though but a conductive one instead, as we will explain later.

The model addresses a comparative-international perspective.

## Introduction

The importance of studying accounting from a comparative-international standpoint has been recognized since a long time ago. Ever since world trade started to develop, corporations across nations started to import and export accounting practices as well, realizing that they could gain more insight into its own accounting system by studying those used by others in different countries (Nobes and Parker 2000).

Accordingly, one reason for comparative-international studies, either in business or governmental accounting, seems to be "learning with each other." Indeed, "it is possible for a country to improve its own accounting by observing how other countries have reacted and are reacting to problems that, especially in industrial nations, may not differ markedly from those of the observer's home country. It is also possible to satisfy oneself that, where accounting methods

differ, the differences are justified by differences in the economic, legal and social environment and are not merely the accidents of history" (Nobes and Parker 2000: 6–7).

In the actual international context of globalization, it is clear that the central reason for comparative-international business accounting is harmonization. In governmental accounting, this is also a major motive for comparative-international studies, considering that nowadays every country is, to a greater or lesser degree, integrated in one or more supranational communities, which it must be accountable to. This seems to have been the major stimulus for the first *comparative international governmental accounting research* (CIGAR) study developed in the late 1980s by the German University of Administrative Sciences Speyer (*Deutsche Universität für Verwaltungswissenschaften Speyer*), as well as for other cross-country studies that followed. Moreover, the same reason seems to underlie the need to develop theoretical frameworks, which might be commonly used both to explain governmental accounting innovations/reform processes and to explain and describe the governmental accounting systems' contents.

This entry addresses one of the most important theoretical models developed to frame governmental accounting reforms in the last decades – the contingency/FMR model, also known as Lüder's Model. After an introductory section about the origins of the contingency theory, it focuses on explaining how it was adopted to public sector accounting reforms and then detailing the contingency model since its first version up to the most recent one – the financial management reform (FRM) process model. At the end, some concluding remarks are presented.

## The Origins of the Contingency Theory

As it is commonly acknowledged, the evolutionary dynamics of information systems and accounting systems have been analyzed using organizational theories, finding in these theoretical constructs and organizational models to be subjected to quantitative testing.

The organizational studies had also been the point to start the first studies about the contingency theory; in fact in the organizational studies, which started around the 1960s (e.g., Burns and Stalker 1961; Thompson 1967; Lawrence and Lorsch 1967; Tiessen and Waterhouse 1983), the contingency theory supporters had found also their conceptual framework.

This approach was firstly used by the researchers of international business accounting, trying to categorize countries according to a series of criteria. Several authors, such as Nobes (1998) and more recently Zhang (2005), used these criteria to try to explain the reasons for accounting differences between countries; they aimed to describe and compare different systems with each other in an efficient way. There are several advantages to categorize and analyze the differences among countries, namely:

It promotes improved understanding of the complex realities of accounting practices.

It provides useful information for solving some of the important accounting problems that exist in the world – for example, it can help policy makers assess the prospects and problems of international harmonization.

By looking at other countries in the same group, it is possible for a country to anticipate the problems that it is about to face and the solutions that might work.

Using a deductive approach to identify the accounting development, and linking this to economic or business factors, the influential environmental factors are recognized. The examples of this approach could be seen in Mueller (1967), Choi and Mueller (1984), and Nobes' (1985) works.

The same approach can also be used to understand the influence of the environment for the governmental accounting system. Therefore, it is not surprising that Lüder (1992) resorts to the same approach; in fact, some of the aims this author explains in his first paper are the same previously indicated as advantages of the contingency theory.

## Adapting the Contingency Approach to Governmental Accounting Reforms

The initial contingency model was acknowledged as "a by-product of the Speyer Comparative Governmental Accounting Study focused on the features of (central) government budgeting and accounting systems of half a dozen industrialised countries, their communalities, their peculiarities and pending reform endeavours" (Lüder 2002: 2).

Therefore, the essence of the contingency model is a comparative-international analysis (Lüder 1989) aiming at classifying the several countries' governmental accounting systems according to internal and external criteria, emphasizing the differences and similarities, in order to learn about the different frameworks, but mainly to provide some insights for harmonization strategies. In reality, the author started his comparative analysis in order to find distinct patterns of the several governmental accounting systems studied and to explain the reasons for the differences between those patterns. For the classification, the internal criteria were accounting entities for governmental type activities, the measurement concept of accounting, the reporting entity, consolidation approaches, and the summary financial statements provided; the external criteria were contextual variables such as the distribution of political power, the legal system, and the professional influence on governmental accounting (Lüder 1989).

As Lüder (1992) himself affirmed, the structure of his model is similar to other models of organizational contingency theory, extended, however, by behavioral components (Khandwalla 1977; Kieser and Kubicek 1983; Schreyögg and Steinmann 1985).

For the comparative analysis, Professor Lüder and his team followed a methodology that embraced personal in-depth interviews with government officials in the respective countries, supplementary discussion with independent government accounting experts, and analysis of accounting documents (Lüder 1989). An interview guide was used for conducting the field studies. This interview guide focused on governmental accounting and financial reporting, covering both institutional framework (professionalism and independence, private sector influence, functional integration, and centralization) and policy questions (objectives of the system, accounting recognition criteria and measurement rules, financial reporting practices and contents, and the dissemination of financial information). Some aspects related to budgeting and auditing were also considered.

The observed differences in practices and procedures as well as in the direction, the state and the pace of reform discussions, and the implementation of reforms required an explanation. (Lüder 2002: 2)

The experience from the empirical research suggested that the observed differences were, at least partly, due to differences in the national political-administrative settings. This seemed to confirm the hypothesis initially stated (Lüder 1989): the primary user orientation of governmental accounting and reporting determines the design of the governmental accounting and reporting system; in turn, this is determined by specific contextual variables – this is however a conductive relationship, not a causal one.

In the last phase of the study, due to what happened at the beginning of the 1990s, a conceptual framework for the development of governmental accounting and financial reporting was to be elaborated.

Although in the interim summary report (Lüder 1989) some accounting and financial reporting theoretical issues were discussed and clarified and country accounting systems had been classified according to those aspects, this approach was not continued, since no further explanations were developed for the "why" of different governmental accounting system contents/designs. What was emphasized instead was the contextual approach of the reform process, i.e., the "why" of changes in governmental accounting systems toward more informative ones, which had led to several interesting discussions over the last decades.

Because the internal approach for characterizing and explaining governmental accounting systems has not been picked up by others, Lüder (2002: 17) additionally recognizes that "is still not available (...) a common framework for describing a governmental accounting system in

sufficient detail that would allow cross-country comparisons on the basis of country studies carried out by different researchers." What exists is a contingency model that "(. . .) attempts to specify the features of the political-administrative environment prevailing in a country and to identify their likely influences particularly on the outcome of governmental accounting reform processes" (Lüder 2002: 2).

Accordingly, it seems that in the Speyer research project development, Professor Lüder came out to redirect his research toward a better understanding of the context of governmental accounting rather than to the accounting system itself. This is why the main conclusions are related to a relationship between national context characteristics and the orientation of the governmental accounting system users (only part of the initial hypothesis). What was expected was an explanation for a relationship between the contextual variables and the contents of the governmental accounting systems. In the end, this was more or less conscientiously neglected, to give place for a framework that although of an extreme importance, only allows analyzing, explaining, and somehow predicting the consequences of a certain context and behavior (later emphasized in the model) in the governmental accounting changing process. Moreover, it is also assumed that this process is toward a more informative accounting system, so it must be innovative in the sense that the outcome must show improvements comparatively to the previous situation.

## The (First) Contingency Model of Governmental Accounting Innovations

The model initially elaborated by Lüder (1989) had a double purpose: on the one hand, it intended to serve as a framework for empirical investigations in governmental accounting reforms, creating a comparison basis for research carried out by different researchers; on the other hand, it wanted to explain the influence of the context on a special reform or accounting innovation, thus triggering research in confirming, refuting, and/or amending it.

In order to accomplish this second purpose, the model specifies the social-political-administrative environment prevailing in a country and its impact on governmental accounting innovations. In this way, it was expected to contribute to explain why those innovations took place in some countries and not in others. The proposed model should explain the transition from traditional government accounting into a more informative system, seeking to integrate ideas from the literature, along with empirical observations collected (via interviews and documental analysis) about the governmental accounting systems of a group of countries, focusing particularly the central government.

The countries initially involved were the USA (federal and state governments), Canada (provincial and federal governments), and a group of European countries (Germany, Sweden, France, Denmark, and the UK). The European Community government was also considered. These were selected considering three criteria: the legal system, the constitution-based organization of government, and the state of governmental accounting and reporting. The sample included both civil/roman law and common law countries, unitary countries as well as federations, and countries following more traditional governmental accounting approaches together with others adopting more innovative frameworks.

After that model was defined, the countries were compared along the various dimensions included in the model, on the basis of the empirical observations made in the empirical phase of the comparative-international study in 1987–1988.

The initial version of the contingency model (Fig. 1) can be summarized as follows: "The Contingency Model is fundamentally an economic model. It posits an information market with users and producers of governmental financial information. The attitudes and behaviours of users and producers alike are shaped by their respective environments. If the conditions are ripe – as occasioned by some stimuli (such as financial scandals or government financial crises) – the interactions between demand and supply could spark governmental accounting innovations" (Chan et al. 1996: 3–4).

**Contingency Model of Reforms in Public Sector Accounting, Fig. 1** Contingency model of public sector accounting innovations – detailed model (Lüder 1992: 111)

As displayed in Fig. 1, there are four modules in this version of the model:

1. *Stimuli of a reform process* – events that occur at the initial stage of the innovation process, which individually or combined reveal a need for better accounting information from the users' side and increase the producers' readiness to supply such information. Accordingly, the stimuli change both the users' expectations and the producers' behavior (intervening variables).
2. *Characteristics of a country social structure* – structural variables external to the government, which influence the basic attitudes of information users and thus change their expectations toward the governmental accounting system.
3. *Characteristics of a country politico-administrative system* – internal structural variables, which influence the basic attitudes of information producers and thus their behavior, in particular their willingness to make changes in the accounting system. Information producers' behavior is also affected by the information users' expectation of change.
4. *Existing implementation barriers* – all environmental factors that could inhibit the implementation process of a reform.

The first three types of contextual variables are supposed to influence the two categories of intervening variables: the change expectations of information users and the change behavior of information producers. The intervening variables together with the fourth category of contextual variables, the implementation barriers, directly affect the outcome of the innovation process which is a conceptually different accounting system (dependent variable) (Lüder 1994: 3).

The environmental factors affecting one country's governmental accounting reforms may be described by a combination of the various manifestations of the model institutional modules. For simplicity reasons, Lüder (1992) assumes that each module exhibits just two different manifestations: favorable and unfavorable to governmental accounting reforms. This assumption allowed deriving 16 (two manifestations; four modules) different patterns of environmental conditions, which are differently favorable to the implementation of a more informative governmental accounting and financial reporting system. A more informative system performs two functions: it supplies comprehensive and reliable information on public finance, and it provides a basis for improved financial control of government activities (Lüder 1992). However, even if the information producers are willing to change, the innovation process might not happen due to the implementation barriers.

This model considered as the beginning of the "first generation of contingency models" explains the transition from traditional governmental accounting into a more informative one. Like in the versions that followed, this transition is assumed to be an innovation process.

On the basis of this first model, some critical issues have raised; one of the most important could be that the contingency model had a speculative nature, since it assumed several hypotheses to explain a rather complex reality, some of them very difficult to prove. Although some plausibility tests might be admitted, the use of an "informed speculation" methodology jeopardizes the model reliability. Indeed, a specific configuration of the contextual variables in the model may be conducive to an innovation process in the governmental accounting system, but the existence of such configuration is neither a necessary nor a sufficient condition for an innovation (Lüder 1994).

In the face of those issues, Lüder himself admitted abundant opportunities for improvements to be done to the initial model. Additionally, because the model is drawn on case studies, more insights from new case studies may lead to changes in the model design and/or components. Therefore, with new experiences from Italy, Spain, and Japan, Lüder (1994) introduced new features into the contingency model, though its basic structure was maintained. The revised model started the "second generation of contingency models."

## The Revised Contingency Model

The revision of the initial contingency model was an "almost natural" consequence of the first version, after further discussions and additional empirical evidence. Indeed, methodological and material improvements were expected to be explored from the first approach, considering the shortcomings acknowledged.

Figure 2 sets out this new version (Lüder 1994), displaying the components of the modules, the relationships between them, and their effects on the results of the governmental accounting innovation process, considering a critical review with suggestions for restructuring done by Lüder himself. This new version posits basically the same as the previous one, in spite of the modifications that were done.

Comparatively to the initial model (Fig. 1), some main differences can be pointed out (Lüder 1994):

1. *Broad behavioral variables were introduced, as intervening variables between the contextual and the dependent ones*.

   Although these behavioral variables were considered in the initial model, its intervening role was not so clear once they were included in the contextual variable modules. Because the behavioral variables are those that affect directly the innovation process, being like

**Contingency Model of Reforms in Public Sector Accounting, Fig. 2** Revised contingency model of public sector accounting innovations (Lüder 1994: 9)

"instruments" used by the contextual ones, the introduction of separated clusters allowed further emphasis on its important function.

In this revised model, all the clusters were positioned vertically, so the effects point down directly to the result of the innovation process (Jaruga and Nowak 1996). This modification of the initial model structure was also, to a certain extent, an attempt to surpass the problem of too much focus on the contextual variables.

2. *The contextual variables were also clarified, considering both the mode of influencing the innovation process and the temporal stability.*

A different classification for the contextual variables was presented: temporarily present (relatively unstable environmental characteristics, stimuli), indirect relatively stable (relatively stable environmental characteristics that affect the innovation process via behavioral variables, structural variables), and direct relatively stable (relatively stable environmental characteristics that directly affect the innovation process, implementation barriers).

3. *The roles of political and administrative actors were differentiated*.

   The structural variables of the politico-administrative were separated into two components: the political structural variables and the administrative structural variables.

   This seemed to be more adequate, considering the importance of the political actors (members of parliament and members of government) in initiating and sustaining an innovation process. Moreover, a separate cluster for political variables allowed considering the particular situation of political actors – both producers (with respect to general public) and users (with respect to bureaucracy) of information – while social actors are only users and administrative actors are only producers (with respect to politicians and general public) of accounting information.

4. *Some of the module components were reclassified, others were omitted, and new ones were added*:

   *Capital market*, before considered as stimulus, was reclassified as part of the social structure. This was done taking into consideration bond rating agencies in particular, which are users (general public) of governmental accounting information.

   *External standard setting*, instead of being a stimulus, was better considered as an intrinsic part of the administrative structure. Accordingly, the establishment of "standard setting organizations" was explicitly identified as having an impact on the behavior of administrative actors (Chan et al. 1996).

   *Professional interest* was transformed in "organized pressure groups," moving accordingly from being an external stimulus to becoming part of the social structure. This was done because it was considered that accounting professionals could be interpreted as a possible pressure group with interest in public sector accounting and reporting information. Their interest affects and eventually reinforces the general public demand for more comprehensive and more reliable financial information. Indeed, "the expectations of the general public in regard to the government's financial structure disclosure and financial management need reinforcement by powerful pressure groups (e.g., professional accountants' organisations, business corporations' associations, labour unions, tax payers' associations, etc.) to affect the change behaviour of political and administrative actors" (Lüder 1994: 7). Moreover, Lüder (1994) considered that the function of these pressure groups in governmental accounting innovations is making certain issues (such as administrative efficiency and effectiveness and governmental accounting and financial reporting) to become a political matter.

   *Organizational characteristics*, considered before as implementation barriers, became instead part of the administrative structure. It was recognized that government characteristics regarding accounting, such as the distribution of responsibilities for the development of the accounting system (strengthening of financial functions), are a factor that directly influences the change behavior of administrative actors.

   *Socioeconomic status* was omitted from the model because no evidence was found for its influence on the expectations of the public regarding governmental financial disclosure and financial management. In the author's opinion, it did not seem to be plausible to assume such a direct influence, given that the empirical validity of such hypothesis was substantially questioned.

The existence of a *dominating doctrine* was added to the conceivable and observable stimuli.

Lüder (1994: 7) explains that "a dominant doctrine can either further the effect of other stimuli on the innovation process or even function as a stimulus on its own."

Additionally, it was recognized that a dominating doctrine "together with change of the parliamentary majority" could affect the attitudes and behavior of political actors. Such a political change may be a factor also furthering governmental accounting innovations. "In short, politics affect governmental accounting" (Chan et al. 1996: 6).

The dominating doctrine as a possible stimulus, allowed, among other things, distinguishing two main variants of the contingency model (Lüder 2002): the accountabilism-driven and the managerialism-driven. Subsequently, two approaches of the observable innovation processes were derived.

The main purpose of the "accountabilism-driven" process is an improvement of governmental external reporting toward more transparency. In fact, Lüder (1994: 10) considered that this kind of process could be "triggered by some type of financial scandal that results in a demand for more transparent, comprehensive and reliable financial information to be released by the government." Accordingly, in this variant of the model, users are primary important actors in the governmental accounting reform process.

The "managerialism-driven" approach aims in first place at contributing to more efficient, effective, and economic public sector management. Therefore, it is "primarily concerned with reforming governmental internal (managerial) accounting, but improvements in financial accounting and reporting sometimes is a by-product of the innovation process" Lüder (1994: 10).

Thanks to some studies, one can affirm that such an approach, where producers of governmental accounting information play the primary role, is mainly stimulated by fiscal stress and can be either an isolated reform (e.g., as happened in Spain) or part of a comprehensive administrative reform (e.g., as in the UK, Australia, and New Zealand).

Many country studies and cross-country comparisons, including the less developed countries (LDC), followed this version of the contingency model, not only by recommendation of Professor Lüder but as a result of a certain enthusiasm of researchers for having been available, for the first time, a comparative framework with such potentialities.

While testing this model – particularly the revised version – some modifications and extensions were unavoidably made to its structure and variables contents, mainly as a consequence of critical applications of the framework to individual country studies. Some authors also used different theoretical approaches to complement the contingency one. These studies additionally highlighted the need for some modifications, creating an important incentive to take up again the model on hand and revise it. An extensive revision of these studies on the application of the contingency model can be found in Jorge (2003).

## The Financial Management Reform Process Model

The reasons already explained led Professor Lüder to revise his model; in fact, in 2002 he presented the financial management reform (FMR) model – a completely modified version of the 1994 revised contingency model. He explained that this model was developed not only adopting some of the former modifications and extensions but also adding new ideas, brought about by discussions and other authors' critics. Besides, continuing the tendency of the model being drawn on case studies, new contributions from a research visit to Australia were taken into account (Lüder 2002).

This new model (Fig. 3), still framed by a contingency approach, addressed the financial management reform process in a country, which involves "stimuli" and "institutional arrangements," two clusters of contextual variables; "reform drivers," "political reform promoters," and "stakeholders," three clusters of behavioral variables; and "reform concept" and

**Contingency Model of Reforms in Public Sector Accounting, Fig. 3** Financial management reform process model (Lüder 2002)

"implementation strategy," two groups of instrumental variables.

Compared to the contingency (revised) model, the differences worthy to mention are:

1. *The model formal structure is radically changed* – although the FMR Model still displays a relation between contextual variables and the outcome of a reform process in governmental accounting, the modules were completely rearranged, and new ones were added:

The contextual variables are now just included in the clusters "stimuli" and "institutional arrangements."

The behavioral variables, which in the previous version were considered as intervening (instrumental) variables between the

contextual and the dependent ones, are now presented as behavioral clusters sensu stricto, correcting the emphasis of context over behavior.

New instrumental variables are considered, with the addition of the "reform concept" and "implementation strategy" clusters.

2. *The actors in the reform process are specified*, aiming to shed some light into the understanding of the processes that generate and implement governmental accounting innovations.
3. *There are changes in the clusters' components and in the links between them* (Lüder 2002):
   I. *Stimuli* (contextual variables) – while they had remained by majority unchanged, the "fiscal or economic crisis," usually underlying a "fiscal stress," replaced the latter. "Requirements derived from administrative reform" were added to make clear that governmental accounting reform can well be embedded in a larger reform of the public sector, and particularly in the case of developing countries, "endeavors to improve international reputation" are also supposed to be a relevant stimulus for governmental accounting reform. The "stimuli" are considered to have a direct *impact* only on the politicians responsible for starting the reform.
   II. *Institutional arrangements* (contextual variables) – this cluster contains most of the components previously included in the (structural) societal, political, and administrative variables, as well as in the implementation barriers. Although the categories are rather broad, Lüder (2002) presents some additional remarks:
   "Legal systems" might be generally classified into civil law and common law systems – different legal systems may be linked to different types of governance (more or less flexible). The legal system also embraces the electoral system and the flexibility of the budget law.
   "State structure" refers to such categories as "unitary/federal," "cooperative federalism/competitive federalism," "one-chamber/two-chamber parliament," and the division of power between the electorate, the (executive branch of) government, and the directed elected bodies and officials.
   "Administrative structure" mainly refers to organizational characteristics of the administrations and the division of powers between organizational units such as "centralized/decentralized," "concentration/fragmentation of financial management functions," "existence of central organizational units at the different administrative levels" that are able to promote the reform in their area, and "formal power position of the heads of central units and the heads of line units."
   "Civil service" refers to the qualification of accountancy staff, but more generally to all other civil servants, which have a significant impact in the way governmental accounting reform is implemented, in the duration and in the cost of that implementation.
   "Culture" refers to the national social, political, and administrative culture, which can be specifically characterized as "risk taking/risk averse," "individualism/collectivism," the "degree of openness" of political and administrative processes, and their "responsiveness" to the needs and demands of the general public.

   Thus, the "institutional arrangements" are *influenced* directly by the "political reform promoters'" behavior and indirectly (via those) by the "reform drivers'" and the "stakeholders'" behavior. On the other hand, they have a direct *impact* on the "reform concept" and on the "implementation strategy," which reinforces the direct force on the "outcome of the reform."
4. *Reform drivers* (behavioral variables) – "These are recognized institutions and professionals in the reform field that promote the reform through oral and written publications aimed at making governmental accounting reform a political issue and influencing political decision makers in a specific way" (Lüder 2002: 10).

C

Accordingly, they suggest motives and ideas for political actors to engage in the reform. Subsequently, their behavior influences all the reform process while *influencing* the "political reform promoters."

To strengthen their influence on the reform process, "reform drivers" might assume the form of groups of experts – "epistemic communities" (Laughlin and Pallot 1998), sharing views on the main reform characteristics.

5. *Political reform promoters* (behavioral variables) – these are the politicians, usually members of government, who initiate a reform and have the power to enforce it: the minister of finance and the prime minister play a key role.

   Hence, the "political reform promoters'" behavior directly influences not only the "reform concept" and the reform "implementation strategy" but the "institutional arrangements" and the "stakeholders" as well.

   Usually, the views of the "reform drivers" and the "political reform promoters" regarding the innovation process are coincident.
6. *Stakeholders* (behavioral variables) – these are people and institutions positively or negatively affected by the reforms (e.g., the general public, the parliament, the administration, the statistical offices, etc.).

   Although "stakeholders'" behavior might be *influenced* by "political reform promoters" and might also *influence* them, these actors' views concerning the reform normally differ. Some "stakeholders" welcome the reform, expecting it to be in their interest; others, on the other hand, may oppose it, since they expect rather negative effects.

   Usually, it can be asserted that stakeholders' attitudes toward the reform depend on the reform concept and the implementation strategy, on their chances to affect both, and that they are susceptible to political reform promoters' influence.

   For the reform process to be successful, "political reform promoters" must lead opposing "stakeholders," especially those with key positions and powers within the process, to take at least a neutral position.
7. *Reform concept* (instrumental variables) – innovations in order to allow the governmental accounting system to provide information useful for ensuring financial accountability and sound financial management, conceptually not merely procedural changes. Innovative concepts underlie the innovation process. It has a direct *impact* on the "implementation strategy."
8. *Implementation strategy* (instrumental variables) – the manner used to implement the reform can affect the outcome of the reform itself. The strategy includes components related to the way the reform is implemented (e.g., more authoritative or more participative), which directly affect its probability of failure or success (outcome).
9. *Lines of influence*, *impact*, *and feedback loops are identified* – complementing and clarifying the links between the variables considered in the previous version ("affect," "reinforce," and "impact"). In particular, the *feedback loops* (consequences on the real world) allow tying behavior and attitudes of key actors in the innovation process to its results, taking into consideration the possibility of a multistage reform process.

   Depending on the size of a still existing gap between the outcome of the reform and the reform concept, the feedback either brings the process to an end or induces a subsequent reform loop with or without prior modification of the reform concept. (Lüder 2002: 14)

The main virtues of this "new contingency model" might be summarized as follows:

(a) With this model, many problems that arose in the previous ones are surpassed, namely:
   *Insufficient explanatory power*: the previous models did not aim to explain the whole reform process including all relevant factors. In the opposite, the FMR model includes reform approach variables, and some specific environment configurations conducive to the implementation of specific reform concepts are considered. This new construction of the model improved

its explanatory power, given that it becomes a representation closer to the reality of governmental accounting reform processes that have been happening in many countries.

*Emphasis on context over behavior*: even though it had not been enough, the specification of the actors involved in the governmental accounting reform process, as well as their behavior, allows the FMR model to step forward in understanding which attitudinal and behavioral variables are relevant to governmental accounting innovations.

*The unclear notion of innovation*: innovations in governmental accounting are broadly considered to be conceptual changes of the accounting system, in order to make it better, i.e., more informative.

Acknowledging this problem, before presenting the last version of his model, Lüder (2002) suggested a distinction to be made between an innovative concept underlying a reform process and the outcome of the process. In the FMR model, a "reform concept" as a cluster of instrumental variables is clearly separated from the "outcome of the reform or a reform stage."

Accordingly, it might be said that though maybe not sufficient, an attempt is made to clarify what one believes to be the most critical and controversial issue in governmental accounting reform: the reform concept itself.

(b) The new model considers some suggestions for modifications and extensions derived from other authors' researches, such as:

*The process of innovation*, suggested by Pallot (1995):

Because in the previous model there was a great lack of specificity of the relevant behavioral variables, and also the innovation concept was still very "cloudy," little was known about how particular innovations are generated and implemented. Because the contingency model was not very explicit about the decision processes through which innovations were developed, a need arose for a more systematic analysis on the processes of generating and implementing governmental accounting innovations, considering that they may affect the failure or success of the whole reform process.

The FMR model tries to fill this gap, considering a cluster of instrumental variables concerning the "implementation strategy," which embraces process variables, while the decision process underlying the reform is still not considered. This was done where a module aimed at characterizing the innovation decision process complements the contingency approach.

*Consequences in the real world*, suggested by Jaruga and Nowak (1996):

Following this suggestion, in FMR model, lines representing the "consequences on the real world" were introduced, so as to reflect the fact that the outputs of a governmental accounting reform have indeed consequences disseminated to the environment – firstly affecting the behavior of the actors involved in the reform and later even the contextual variables.

Through the feedback loops, the FMR model adds this suggestion, while the consequences are considered to be only on the reform actors' behavior. Therefore, as explained, the model, now more dynamic, allows not only tying behavior and attitudes of key actors in the innovation process to its results but also considering a governmental accounting reform process involving several stages, which is very useful since this has been the case in some countries (e.g., Poland and Portugal). It must, however, be reminded that the rational expectations about the consequences of accounting reforms might affect their success or failure.

*Epistemic communities*, suggested by Laughlin and Pallot (1998):

C

As mentioned, the FMR model considers that these communities of experts might have an important role not only in initiating a governmental accounting reform process but also in influencing its direction and outcome.

Accordingly, considering that forming "epistemic communities" might be a possible grouping behavior of "reform drivers," reinforcing its influence on the innovation process, the FMR model considers one that seems to be a progressively more important reform driver in industrialized countries.

## Conclusion

The most recent version of the contingency model – the FMR model – is viewed as an important comparative governmental accounting theory, already providing some explanation for the "why" of governmental accounting changing toward more informative resource accounting and budgeting systems. Yet, it essentially addresses the effects of the governmental accounting context on the conduciveness to reform processes, not the accounting systems itself (reform content). Therefore, it is an explanation for the "why" of governmental accounting reform process toward a more informative accrual accounting and budgeting system.

Furthermore, it endures some other particular problems, which might affect the model applicability:

"Black boxes:" while additional variables increased the model explanatory power, they lack further explanation – for some variables (e.g., behavioral variables clusters, reform concept, and innovation process), although known as affecting the governmental accounting reform process, one does not know exactly how they do it, to what extent, or what they are precisely.

Complexity and speculation: the complexity of multi-causal relationships between the variables in the model makes it very difficult, if not impossible, to test statistically, though plausibility tests might be used. Consequently it is empirical that validity might be jeopardized, as it still contains speculative features.

Nevertheless, the role that the contingency model has played in the still short history of CIGAR is invaluable. Regardless of future contributions that might be important for research in comparative governmental accounting, Professor Lüder's contributions will always be considered as a major part of the basic theoretical framework for comparative-international research in the public sector accounting setting.

## Introduction: Contingency Theory

The main purpose of this article is to summarize the main ideas and contributions of the contingency theory of leadership (CTL) and to show its usefulness for the public sector. To do that, we are going to adapt it to the special characteristics and traits of public management considered as a design science (Barzelay and Thompson 2010).

The most important theoretical backgrounds of the CTL are the behavioral school and McGregor's Theory X and Theory Y. According to McGregor's thesis (1960), leadership strategies are influenced by a leader's assumptions about human nature. A leader holding Theory X assumptions would prefer an autocratic style, whereas one holding Theory Y assumptions would prefer a more participative style. Anyway, the best style of leadership was the participatory. Later on, Blake and Mouton (1964) created the "managerial grid." Their grid focuses on task (production) orientation on the horizontal axis and employee (people) orientation on the vertical axis, as well as combinations of concerns between the two extremes. According to this theory, there are five basic leadership styles. Blake and Mouton propose that "team management" – a high concern for both employees and production – is the most effective type of leadership behavior.

While behavioral theories may help managers to develop particular leadership behaviors, they

give little guidance as to what constitutes effective leadership in different situations. Because of that, the CTL emphasized the situational variables leaders must deal with, criticizing the idea of a universal set of traits associated with effective leadership. They look for effective leadership behavior. In order to find it, for example, researchers at the Ohio State University administered questionnaires to thousands of employees to identify successful styles of behavior. They identified two broad categories of leadership behavior: consideration (or concern for the welfare of subordinates) and initiating structure (concern for the accomplishment of goals). Later, this theory was refined in different ways, such as the contingency theory (Fiedler 1967; Vroom and Yetton 1967; Hersey and Blanchard 1977). And more recently, research on leadership behavior has identified a third category of behavior (Lindell and Rosenqvist 1992): development-oriented behavior (concern for experimentation, innovation, and organizational change), a behavior that is connected with the transformational theory of leadership.

According to *Fiedler's contingency model* (1967), there is no single best way for managers to lead. Situations will create different leadership style requirements for a manager. The solution to a managerial situation is contingent on the factors that impinge on the situation. Fiedler looked at three situations that could define the condition of a managerial task: (1) Leader-member relations: How well do the manager and the employees get along? (2) Task structure: Is the job highly structured, fairly unstructured, or somewhere in between? (3) Position power: How much authority does the manager possess? These environmental variables are combined in a weighted sum that is termed "favorable" at one end and "unfavorable" at the other. Task-oriented style is preferable at the clearly defined extremes of "favorable" and "unfavorable" environments, but relationship orientation excels in the middle ground.

*Tannenbaum and Schmidt's leadership continuum* (1958) is the consequence of the criticism of the idea of black and white terms of leadership. The autocratic and democratic styles are extremes and most leaders in business will do something between the two. These authors defend the idea that leadership behavior varies along a continuum and that as one moves away from the autocratic extreme, the amount of subordinate participation and involvement in decision-taking should increase.

The *Hersey-Blanchard model of leadership* (1977) posits that the developmental levels of a leader's subordinates (maturity) play the greatest role in determining which leadership styles (leader behaviors) are most appropriate. Maturity is the willingness and ability of a person to take responsibility for directing his or her own behavior. The key situational variable, when determining the appropriate leadership style, is the developmental level of the subordinate. As a result, there are four leadership styles:

- Directing: The leader provides clear instructions and specific direction (task behavior). This style is best matched with a low follower readiness level.
- Coaching: The leader encourages two-way communication and helps build confidence and motivation on the part of the employee, although the leader still has responsibility and controls decision-making. This style is best matched with a moderate follower maturity level, specifically when the follower has willingness to take responsibility but does not have ability.
- Supporting: The leader and followers share decision-making, but the leader provides support and encouragement (relationship behavior). Participating style is best matched with a follower who has the ability to make things happen effectively but does not have willingness to take responsibility.
- Delegating: This style is appropriate for leaders whose followers are ready to accomplish a particular task and are both competent and motivated to take full responsibility. Delegating style is best matched with high follower maturity.

As the level of followers' maturity increases, the leader should begin to reduce his or her task behavior and increase relationship behavior.

Finally, Adair's action-centered leadership model (1973) is based on the idea that an action-centered leader must direct the job to be done (task structuring), support and review the individual people doing it, and coordinate and foster the work team as a whole. The effective leader carries out the functions and exhibits the behaviors depicted by the three frames. Situational and contingent elements call for different responses by the leader. Hence the various frames may be bigger or smaller as the situation varies.

## The Public Management Approach

In order to adapt the CTL to the public sector, we must first answer the question as to whether or not there is any difference between managing public and private organizations. We have public administration because we understand that there are services that the market should not provide, and this is based on social values, on the public interest, and on the political will of citizens (Rainey 1997). But being able to draw a clearly defined line between the public and private sectors is simply impossible. There are criteria that allow us to make distinctions, but not always, i.e., the interests at stake in cases of private individuals or groups, access to information, resources or buildings, agency, or the ability to act (or not act) on behalf of the community (Benn and Gaus 1983). Rainey indicates no fewer than thirty-three differences between public and private management (Rainey 1997, p. 73), of which we would highlight the following distinguishing public characteristics: greater political influence; quasi-legislative and quasi-legal capacity; greater expectations for equitable and equal treatment and for transparency; greater ambiguity and/or contradiction in objectives; greater constraints in public manager decision-making, both inwards and outwards; greater difficulty in linking incentives to performance; and slightly different value system related to work. Indeed, what exists is a *continuum* from private enterprise to ministries, as Dahl and Lindblom have stated (1976), a *continuum* which includes from pure private enterprise to ministries or secretaries of state, passing through private companies whose largest sources of income come from the public sector, mixed public-private enterprises, majority publicly owned enterprise, NGOs, etc.

Summarizing, different authors have brought out two principles: (1) There are differences (and similarities) and (2) these differences should be analyzed in a *continuum*. This leads us to postulate that although CTL can be useful to both public and private managers, it can be enriched for the "pure" public sector if we introduce public variables in its framework. Likewise, one cannot defend the same model of management for an executive in a private enterprise and as a high-ranking official of the federal government. Their interests, prioritization of values, or authority requires different responses to their demands for a leadership model. Public management theory was born to deal with this kind of professional problems. In a nutshell, the public management's objective is to generate a theory to give public managers an indication of how to act in different environments and situations and to identify and teach the skills needed to satisfactorily put this theory into practice (Perry 1993). In this context, the leadership literature must give thought to which organization it is addressing in each individual case and examine the teaching that may be useful accordingly, instead of succumbing to the tendency to put all managers in the same frame of reference.

## A Contingency Model of Public Leadership

As Van Wart (2003) stated, the literature on leadership is abundant in management, not so far in *public* management. Because of that, this contribution will deal with the introduction of "public" variables in the contingency theory. Within a democratic system, administrative positions are closely bound to legitimacy, both of origin and exercise. A lack of such legitimacy would challenge the access and sustenance of power. Furthermore, to hold an administrative position is linked to a variety of special duties and limited domains. In the political theory, there exist two

concepts, that is, *auctoritas* and *potestas*, which help to understand this fact. *Auctoritas* implies that those who hold power have to be legitimized by means of their capacity to meet citizens' expectations, that is to say, to be able to develop a legitimate political discourse, to make the right choices in strategy, and to achieve results. However, *potestas* is more related to the power source and has to do with the space and time which is possible to exercise power in accordance with the constitutional or legal framework. Otherwise, the exercise of public leadership is done within spatial and temporal borders, and by all means, those borders are defined through a variety of implicit and explicit mandates which frame the mission, tasks, and responsibilities of those who hold managerial positions in an organization.

It could be argued that studies on public leadership place the emphasis on analyzing the leader's *auctoritas* rather than his/her *potestas*. It is not the same to be the mayor in a city than to be the chief of the municipal register, and it is not the same to be the president or the prime minister of a government than to be a middle manager. They have different responsibilities and different *potestas*, and they have different origin in their positions and different need of *auctoritas*. These two variables permit us to better understand public leadership. In the dimension ***potestas***, we could integrate two sub-variables; one is organizational and the other is individual. The first sub-variable is the level of "publicness" or "institutionalization" of the organization where the manager works. We think that the organization as the unit of analysis is critical in leadership (Cook 1998, p. 228). Organizational structure shapes the behavior of the individuals. Plans and visions are different if the organization is an instrumental agency or a public company than if the organization is a ministry or a secretary of state. The instrumental nature is different because a public company usually has a very narrow mission, but a secretary of state has a much more open mission and conflicting responsibilities. According to Selznick (1949), leaders are supposed to define the mission of the organization and protect its distinctive character, and leaders must defend the organization. Even more, managers must protect the jurisdictional boundaries of their agencies and defend their autonomy from other rival agencies and political restrictions hampering them in their action (Terry 1995, p. 99). Institutionalization is understood in this paper as the degree of power granted to the organization by the law, the amplitude of stakeholders and conflicting values in decision-making, the quasi-legislative and *adjudication* capacity granted to the organization and its officials, and the legislative and legal controls in decision-making. Getting back to the distinction made earlier, it is not the same thing to manage family business selling sports equipment as it is to manage a team of investigators in the FBI. The latter can affect fundamental rights and attempt on citizen's freedom with the legal support of the state. There are different levels of institutionalization or "publicness" that determine leader's options. As much power is granted to the organization, much control is needed. Concluding, public managers make decisions that authoritatively allocate values, but the organizational environment determines what decisions can be made and how they can be made (Wilson 1989).

The second sub-variable in the dimension *potestas* is the level of responsibility of the manager. "Level of responsibility" could be understood as the realm of authority over one or several policies, formal legitimacy for decision-making, and independence or non-dependence from superiors granted by the law or the internal norms of the organization. The degree of validity of advice or guidance varies enormously in relation to this variable. Certain advice that may be useful to a deputy minister is not useful to a middle-level manager in a bureaucracy. In terms of *potestas*, there are important differences between the different ranks in an organization, and the leadership theory espoused should consider this situation. Putting together the two sub-variables, we find the most accurate picture of the position of a manager in the public sector (see Fig. 1), because an executive manager in a public company providing waste disposal services probably has less *potestas* than a middle manager in an agency like the FBI. The organizational

+ Responsibility of public manager

| - Level of publicness of the organization | | |
|---|---|---|
| | Low level of publicness and high level of responsibility. For example: The director of a waste disposal public company. | High level of publicness and high level of responsibility. For example: the FBI director. |
| | Low level of responsibility and low level of publicness. For example: the chief of communication of the waste disposal public company. | Low level of responsibility and high level of publicness. For example: The chief of the DNA-Mitochondrial team within the FBI. |

+ Level of Publicness of the organization

- Responsibility of public manager

**Contingency Theory of Leadership, Fig. 1** Level of *potestas*

environment influences the level of *potestas* and the kind of leadership the manager should prioritize.

The situation changes when we analyze the dimension **auctoritas**. The auctoritas is neither established by the law nor stabilized by the institutional design. It has to be achieved and built through the process of legitimation. For us, auctoritas is the degree of acceptance of the organizational and individual potestas by the stakeholders. Every organization and every manager need auctoritas. But the need of it is different depending on two sub-variables. The first sub-variable is the need of legitimation of the organization. The second is the level of responsibility of the manager.

The need of legitimation implies the need of providing legitimacy. According to Weber (1984), legitimation is the process of making something acceptable and normative to a group. The mission and existence of public organizations need to be acceptable to the stakeholders they have. But some organizations need more public legitimation than others. This need depends on multiple factors, for example, the exposition to the media or the use or not of legitimate violence. And some organizations need a more technical legitimation and others need a more public one. The kind of legitimation is different considering the mission of the organization and its level of publicness. The ministry of the interior needs more public legitimation than a company like a public shipyard, considering its powers and its role in our society. As a consequence, the minister of the interior needs a lot of auctoritas and should protect very strongly his/her public and private image.

The second sub-variable is individual, not organizational; it is, again, the level of responsibility of the manager in his/her organization. In terms of the need of auctoritas, there are important differences between the different ranks in an organization, and the leadership theory espoused should consider this situation. A middle manager in a public company has lower need of auctoritas than the CEO. The need of auctoritas of the minister of the interior is bigger than the one needed by a police officer. Putting together the two sub-variables (see Fig. 2), we could find a more accurate picture of the leadership needs of public managers. For example, the CEO of a public company (such a public shipyard) needs to have economic competency and entrepreneurial skills to do her job. But the minister of the interior needs political skills and an image of public and private honesty very well built. The organizational environment influences, again, the need of auctoritas and the kind of it the manager should prioritize.

| | + Responsibility of public manager | | |
|---|---|---|---|
| - Need of political legitimation of the organization | Low need of public (political) legitimation and high level of responsibility and technical authoritas. For example: The director of a public shipyard. | High need of public (political) legitimation and high level of responsibility. For example: the Minister of the Interior. | + Need of political legitimation of the organization |
| | Low need of public legitimation and low level of responsibility. For example: the chief of the training department in the public shipyard. | Low level of responsibility and high level of public and technical legitimation. For example: The chief of a team of tax inspectors in the Internal Revenue Service. | |
| | - Responsibility of public manager | | |

**Contingency Theory of Leadership, Fig. 2** The need of *auctoritas*

## Conclusions

Contingency theory is one of the most influential theories of leadership and has shown its usefulness for the public and private sectors. But managers should be made aware of its limits. None of the CTL models are useful always although some of them have interesting ideas that can be useful in the appropriate context. It helps a lot to deal with the complexities of managing a team of workers. But leading a team is only one part of the components of good leadership, especially in certain levels of government (see Heifetz 1994). That is why literature on contingency leadership needs to build more sophisticated models in order to improve its benefits for specific public situations and roles. How to connect CTL with different public environments and to underline the practicality of these designs is the motive that has driven this paper.

In particular, we underline that public organizations have different levels of *potestas*, that is to say, different levels of institutional power; the maximum institutional power implies quasi-legislative and adjudication capacity on areas that affect fundamental rights. The more the institutional power of the organization is, the more important the controls on the managers of the organization are. Moreover, in public organizations, the *auctoritas* is also important; every organization and every manager need *auctoritas*, but the need of it is different depending on two sub-variables. The first sub-variable is the need of legitimation of the organization. The second is the level of responsibility of the manager. Applying these ideas, we could conclude that public leaders with high level of *potestas* and big need of *auctoritas* must boost participation and protect the freedom of the citizens to whom their missions and objectives affect; accordingly, they should refrain from managerial innovations which could endanger freedom or security of the people they must protect.

# Contingency Theory of Organizations

Eric E. Otenyo
Northern Arizona University, Flagstaff, AZ, USA

## Synonyms

Exigency; Turning point

## Definition

Identification of the circumstances under which a particular research finding is most applicable and appropriate. Contingency theories are a response to areas in organizational studies where the environment and other factors do not allow for models to be suitable in all circumstances and situations.

## Introduction

As a major organization theory literary stream, contingency theory responded to the challenges identified with both the Human Relations and Organizational humanism approaches. Contingency theorists claimed both the Classical thinkers and the Human relations approach made the same mistake through the claim that there was one best way of managing all organizations. For example, Max Weber's classical work neglected the role of structural variables in bureaucratic organization. He and others argued that specialization and formalization were key to maximizing performance. And Frederick Taylor's scientific management was universalistic and claimed to be one best way for maximization of organizational outputs. A similar universalistic analysis was evident in the neo-human relations school, especially Rensis Likert's claim that participation was a central value for maximization of organizational productivity. In essence, neo-humanists reified the universalistic argument with regard to maximization of organizational outputs.

The contingency approach suggests that organizational management is a relative and adaptive process, in which case, appropriate styles of action are contingent on a number of organizational considerations. This nonuniversalistic view implies that "organizational effectiveness results from fitting characteristics of the organization, such as its structure," to contingencies that reflect the situation of the organization. The proposition suggests that performance is a result of the fit between factors such as people, technology, market changes, organizational size (Child 1975; Pugh and Hickson 1976), strategy (Chandler 1962), and culture (de Ven and Drazin 1984; Donaldson 2001, p. 1; Burns and Stalker 1961).

Perhaps, we should explain that the organizational strategy determines whether or not departments such as production, sales, and marketing are organized to attain maximum efficiencies. And following classical work, organization theorists found that the Weberian bureaucratic structure was appropriate for large organizations, especially because these organizations were associated with rule making put in place to govern repetitive operations. Simple, bureaucratic structures had the tendency to be more centralized and were associated with personalized decision-making management styles (Child 1972). Tom Burns and Graham Stalker (1961) gave prominence to the uniqueness of environmental factors in shaping organizational outcomes. Their research findings based on British and Scottish industries reported that organizations operating in stable environments produced different outcomes from those in unstable and or dynamic environments. The organization is subsequently shaped by the contingency because it has to fit these variables and avoid barriers to optimum performance. Donaldson conceptualized the model in terms of SARFIT (structural-adaptation-to-regain fit), which is, fit affects performance. In this formulation, the organization seeks to avoid characteristics associated with misfit conditions arising from change in contingencies. This tradition is often referred to as the structural contingency theory because of the alignment of structures and organizational characteristics.

The originators of the concept, including Joan Woodward (1958, 1965), Paul Lawrence and Jay Lorsch (1967), recognized different environments place differing requirements on organizations. In particular, based on studies conducted in ten US-based firms, they affirmed structures were an important force in organizational success. Later, scholars employing ecological perspectives demonstrated that different technological and market environmental arrangements required unique kinds of organizations in order to succeed. Accordingly, contingency means outcomes are dependent on other things and intricately changing factors within the organization and environment (Waldo 1978, p. 592). And, for organizations to be successful at achieving their goals, there must be a "goodness of fit" "between their structure and the conditions in their external environment" (Daft 2007, p. 27; Pennings 1992). Pennings empirical work shed light on interactions among variables including environmental uncertainties and organizational structures and how these impacted performances in competitive market settings. Structural elements had a strong impact on organizational performance.

Studies on ways in which the nature of work affects organizational structures have provided valuable insights on impact of technology to production and effectiveness. Organizational sociologists are now in a position to predict and isolate the most critical structural features of organizations. Structures are important in organizational design, especially, for reducing uncertainty and effective coordination of various units.

We prefer to regard this body of literature as "theories" rather than in singularity because different scholars apply varied and multiple explanatory variables. Contingency theorists place much premium on environmental independent variables. Thus, for example, Burns and Stalker (1961) viewed organizations from two different structural forms, mechanistic and organic. The former more traditional in scope characterized by an emphasis on hierarchy and vertical communications patterns. The latter referencing fluid structures with horizontal communication forms and focused on knowledge rather than authority.

Organic organizations are more likely to adapt to changes in the environment and embrace technological innovations more readily. Through empirical work done in the manufacturing and food-processing sector, Burns and Stalker (1961) determined different subunits within organizations experienced different external demands. And to cope with the different stimuli and pressures, organizations created specialized structures, some opting for more centralization while others choosing decentralized decision-making formations. Those that performed at higher levels were observed to match the complexities of their environmental situations (Blau and Schoenherr 1971).

Contingency theories have wide applications in areas such as leadership and decision-making in

different organizational settings. Contingency theory of leadership is adequately discussed in Manual Villoria's entry in this current encyclopedic volume (2016). From a decision-making standpoint, depending on technical knowledge and consensus in problem definition, organizations apply different decision-making approaches to solve the challenges. While consensus is necessary for organizational managers to be clear about what they are faced with, technical knowhow is necessary to fix the problem. Contingency frameworks bring together the two dimensions to strengthen the environmental basis of the theory. The writers in this tradition must grapple with questions about the meanings of concepts such as adaptation, environmental demands, and the organization's internal features.

## Decision-Making and Other General Applications in Organizational Life

Several contingency theories relate to decision-making and echo aspects of leadership mentioned above. For example, Victor Vroom and Philip Yetton (1973) normative model contends that the effectiveness of a decision is a function of a number of situations and the importance of the quality of the decision. The model emphasizes participation as a key variable in producing effective decision procedures and outcomes. Vroom and Jago (1988) reformulated the situational leadership thesis to account for variations in different styles of leadership ranging from autocratic, to consultative-group approaches.

In general theory, rational decision-making follows economic logic and explains the behavior of individuals in terms of maximization of their goals. The rational theory is based on systems approaches and recognizes that the decision makers seek to produce the most output. However, contingency theorists point that the effectiveness of decisions is a function of situational variables that include existence of relevant information and likelihood that other actors will accept the decision. Contingency theorists recognize that a good decision is not a certainty because of ambiguities in goal setting and planning. Gortner et al. (2007, p. 281) acknowledge the difficulty in devising a contingency theory of decision-making noting it involves political choice about whosoever controls what kinds of decisions. To navigate the controls may require some degree of persuasion, especially is development of contingency rules that structure decisions. Mary Smith (1984) argues that contingency rules create contextual responses to messages generated and communicated within organizations. Smith's research provided new insights on roles of contingency rules in shaping compliance gaining behaviors within organizations.

Vanderbilt University's Professor of Management, Richard Daft (2007) adds that contingency decision-making theory brings together dimensions of problem consensus and technical knowledge about solving problems (p. 468). He adds that decisions made following prescriptions implied in contingency theory are more likely to be successful, and therefore managers seeking better performance, in a highly competitive world, maximize their chances for success through embracing contingency models (Daft 2007, p. 470). The contingency model's explanatory power is also evident from studies on contextual conditions for reforms in public sector financial management (Lüder 1992).

Applications of contingency theories to decision-making identify that the design of organizations must be in accordance with cultural norms. This is important, especially in business and corporate organization. For example, professors of marketing have applied contingency theory to equip managers with insights on how best to align organizational structures to their organizations. To this end, contingency perspectives explain the importance of adaptiveness of organizational structures to unit business goal attainment. The literature is replete with articles that speak to applications of contingency theory in the corporate world with increased attention drawn to issues such as the fit between corporate social performance and attendant strategies and structures.

Still, contingency perspectives have been offered as significant approaches to understanding not only business strategies but focusing on ethical practices in marketing practices. More

important, there has been an absence of consensus about ethical conduct among marketers, and contingency theory helps reduce the confusion among academics.

Other applications of contingency theory may be considered in the area of predicting employee suitability in serving at different situations. Such knowledge helps determine how well rounded individuals are and adds value to appraisal systems. Besides, contingency theory has been used to assess effectiveness of individuals in specified organizational roles and tasks.

These attributes lead us to determine the key strength of contingency theory as its empiricism. The impacts of situations can be measured, even if in simplistic terms. Moreover, the theory has some degree of predictive power and supports organizational identification of optimal roles assigned to leaders and their subordinates.

In addition, applications of contingency theory have proliferated into other areas of human resource management, including compensation systems. Studies identify possible links between strategy and the effectiveness of the compensation plans. Delery and Doty (1996), Guest (1997), and Delery (1998) exemplify applications of the theory to human resource management characteristics of organizational life.

Studies also show applications of contingency theory in areas such as management control systems, where the goal is to increase knowledge about the design of control systems in management. Such research supports practitioners improve organizational settings and workplace policy development. Additional applications in the area of public relations practice have been reported and subjected to scholarly attention (See, Cancel et al. 1999). More profoundly, scholars in this genre have through national surveys identified more than eighty-five contingent variables involved in the public relations profession.

## Critics of Contingency Theory

While there is no doubt that contingency theory has made its indelible mark on scholarly studies of organization behavior, design, performance, planning, and management strategy, critics identified several problems with its general appeal. Foremost was the observation that contingency theory is not one unified body and is, in fact, a body of perspectives. Among the problems associated with contingency theory is the lack of clarity in its statements.

Further, the theory embedded symmetrical and nonmonotonic assumptions its core arguments. Skeptics of generalizable facets of the theory doubt its empirical efficacy pointing out to data, which suggests relationships between structure, technology, and organizational effectiveness are far more complex than described in the theory. And there is confusion about the unit of analysis, for instance, the organizational division or its head offices. Still, although much of the focus on the relationship between structure and context dominated empirical research, a marked paucity of works on measures of performance was identified as point of concern (Dalton et al. 1980). In many instances, the research has also not offered robust distinctions between social and economic performance variables. It is fair to assume that some structural contingencies are more sensitive to social performances such as incivility and absenteeism, while economic performance metrics like return on investment (ROI) are emphasized in structural contingencies.

We have previously alluded to criticisms levels against specific tenets as underscored in its applications in areas such as leadership, human resource management, and decision-making.

In addition, as concerns the general core premise of contingency theory is a subject to misinterpretations. In particular, the SARFIT model seems to defy commonsense, because it suggests that when contingencies change, performance declines, leading to an erroneous consideration to argue for the organizational structures to change and match their new or emerging contingencies.

## Conclusion

Contingency theory of organization is a theoretical perspective with rich empirical support in the

social and behavioral studies. Starting from the view that organizations as open systems face challenges, contingency theorists believe and recognize the need for prudent, adaptable, and situational remedies to organizational challenges. Contingency theory was a product of the realization that many factors influence organizational effectiveness and behavior and that different responses may be required for varying situations. In addition, organizational structures have to fit managerial styles in order that performance is enhanced. Stated differently, contingency theorists also support managerial efforts to change organizational structures in bid to improve performance.

The theory gained currency as an attempt to offer alternatives to existing frameworks, which seemed universalistic and mostly based on research conducted in developed countries where environmental conditions are stable. Contingency theory has morphed into a lively framework, with added insights from organizations based in developing countries. Contingency theory has improved our understanding of situational dynamics in leadership in different cultural settings.

# Contract Administration

Bill Davison[1] and Clifford McCue[2]
[1]CPPO, Stearns County, St. Cloud, MN, USA
[2]School of Public Administration, Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Contract management; Contract monitoring; Contract surveillance; Project management; Quality assurance

## Definition

Administrative functions related to dealing with contracts: (1) issuing the request to bid, (2) evaluating the bid responses, (3) awarding of contract, (4) implementing contract, (5) contract monitoring and quality assurance (QA), (6) contract surveillance, (7) contract interpretation, (8) measuring completed work, and (9) computing payments.

## Introduction

The purpose of any contractual agreement is to define the parties' responsibilities with respect to a desired outcome, as well as to define the detail necessary for project success (See Davison and Wright 2004). The broad goal of contract administration is to ensure that the agency receives the right quantity of the right material or service of the right quality in the right time at the right place and to do this within the budget and without claim (Thai 2004). Good contract administration requires constant diligence to make sure the vendor is performing consistently with the contract, from the moment of contract award through final acceptance.

Contract administration consists of two broad processes undertaken to ensure project success. The primary process may be considered proactive and include post-award meeting, quality assurance, monitoring and surveillance, inspection and acceptance, payment, and contract closeout. The second and often simultaneous process may be considered reactive as it includes activities that deal with changes or problems that occur during contract performance such as modifications, dispute resolution, contract interpretation, and termination. The extent of performance of each activity will vary given the size, scope, and complexity of the contract and the terms and conditions that apply.

## Proactive Contract Administration

An excellent proactive step is to develop a contract administration plan (CAP). A CAP is an essential component in vendor performance monitoring and evaluation because it provides a systematic way for ensuring that all elements in the contract have been satisfactorily delivered.

A CAP typically includes the following elements:

1. Identify and document each contract deliverable including delivery time, quantity, quality, cost, and place of delivery.
2. Identify potential problems, i.e., delays, insufficient quality, cost overruns, and change orders.
3. Identify the method of evaluation on how acceptance will be determined for each deliverable (i.e., report, test, survey).
4. Develop a contract monitoring plan that identifies the type and level of monitoring necessary to monitor contract progress.
   (a) Incorporate the likely problems and develop a monitoring strategy that minimizes the occurrence of the identified problems.
   (b) Track the progress of contract deliverables and contract issues (typically through a contract management system, spreadsheet, or other electronic tracking applications).
   (c) Maintain information in a manner that is accessible to all members of the project team.
5. Conduct careful monitoring of contractor performance and maintain written records.

(a) Identify the method and level of surveillance necessary to minimize problems.
(b) Require and utilize progress reports, including contractor reporting requirements.

6. Conduct a "kickoff" or post-award meeting with the contractor, and review the contract monitoring plan, and establish an appropriate meeting schedule.
7. Have an internal plan to resolve any performance issues (corrective action plan, performance fees).

### Post-Award Meeting

It is imperative that all parties to the contract agree on the administrative procedures and performance expectations that must be followed relative to the terms and conditions of the contract. To avoid any potential contract disputes or problems once the contractor is engaged, all parties must fully agree on what are the contract requirements, and what are the expected results of the contract. If the parties don't agree on specific components of the contract, as interpreted by either party, then another meeting may be necessary. No contract should proceed until all parties agree on all the terms and conditions of the contract.

### Determining Acceptance

Acceptance means all of the contractual obligations have been fulfilled. To determine acceptance a process must be in place to inspect, verify, or test to ensure contract compliance. There are several options for inspection and testing. The type of inspection is dependent on the type of contract and the potential problems.

Inspection ensures that the contract is fully performed by verifying that the product or service is received in the correct quality, correct quantity, and in a timely manner. After satisfactory inspection, the final acceptance and payment for the product or service can occur. Some examples of inspection techniques included:

1. Exception: Assumes product or service has been satisfactorily delivered unless a complaint has been filed.
2. After Delivery: Inspection occurs after delivery and prior to use.
3. In Process: This method is used to inspect items while work is in progress to ensure that the current production or "work to date" complies with specifications and contractual agreements
4. Final Inspection: The examination of an item or service to ensure conformity to all applicable specifications and requirements before making final payment.
5. Sampling: Examination of a small sample size to determine conformity to all applicable specifications and requirements

### Quality Assurance (QA) and Contract Monitoring

QA is any planned, ongoing, or periodic monitoring activity that measures and confirms contractor compliance with the terms, conditions, and requirements of a contract. Some types of monitoring are:

1. Monitoring by Exception: No monitoring is done except in the case there is an end user complaint. The product or services is assumed to be satisfactory.
2. Follow-up Monitoring: Occurs after a product or service is delivered.
3. Random Monitoring: A direct or follow-up of the contractor's performance undertaken without the contractor's advanced knowledge over the course of the contract.
4. Scheduled Monitoring: Specific dates or times are scheduled.
5. Direct Monitoring: This method requires daily observation.

### Contract Surveillance

This method is used to document the activities that occur during contract performance. The data collected is useful in the event a dispute arises. Some examples are:

1. Observation record
2. Complaint record: recording of complaints
3. Discrepancy record
4. Unsatisfactory performance report
5. Summary evaluation report
6. Contractor status report
7. Surveys

### Contract Closeout

Contract closeout is a formal process for complex procurements such as construction and technology procurements. A checklist is developed which includes all matters that must be examined, validated, and officially closed to complete the contract and its records; some items included in the checklist are:

1. Resolution of claims and liens
2. Any required drawings, submittals, licenses, or warranties
3. Verification of acceptance of deliverables

### Payment

Payment may be made for supplies and services upon acceptance (and sometimes prior to acceptance) of some portion or all of the work required by the contract. Some types of payment mechanisms are:

1. Advance: Full or partial payment is issued after contract award and prior to completion of work.
2. Progress: Permit the contractor to submit invoices for payment as progress is made in performing the contract.
3. Milestone: Payments are made upon completion of mutually agreement milestones.
4. Final: Complete payment upon final acceptance of the project.

## Reactive Contract Administration

During the course of the contract, events may occur that require a reaction from contract administrator such as modification requests, delays, contract interpretation, dispute resolution, and termination. The written contract represents the legal agreement between the parties. It consists of several clauses that address how each of the contract administration activities will be addressed. After the contract is signed, both parties should refer to the contract for direction on how to handle foreseen and unforeseen issues, conditions, and problems that arise during the course of contract performance.

### Modifications

A process must be in place to address how modifications to the contract will be handled. The process should include:

1. Process for determining if a change request is within the existing scope of work
2. Process for determining the equitable adjustment for a change request
3. Process for stopping work

### Delays

Unanticipated delays are one of the most common contract administration problems. The contract must address how delays will be handled. The process should include:

1. Identifying the existence of the actual or anticipated delay.
2. Determine if the delay will impact delivery or performance.
3. Determine fault (excusable or non-excusable).
4. Determine the duration of the delay and/or the financial impact.
5. Determine appropriate action to resolve the problem.

### Contract Interpretation

There may be times when one of the parties files a claim that the terms of the contract are not being followed or if both parties assign a different meaning to a contract term or clause.

### Dispute Resolution

During the course of a contract, disputes between the parties may occur. It is crucial that both parties agree ahead of time how disputes will be handled. The contract should contain a clause that details the applicable procedures on filing a claim, the rights and responsibilities of both parties for making a timely decision, and procedures for appeal of the contracting officer's decisions.

### Termination of the Contract

The contract needs to describe how termination will be handled. There are two types of contract termination options.

1. Termination for Convenience
   The Termination for Convenience clause allows either party to terminate a contract without cause and limits the contractor to recovering costs and profit on work completed and in preparation of the termination settlement. The contractor is not allowed to recover any anticipated profits that will not be realized as a result of termination.
2. Termination for Default
   Despite the use of clear, progressive steps in contract monitoring, it is possible that default may occur. It should be understood that contract termination is always problematic and very risky, and termination for default has serious consequences for both parties. If the contractor is found to be in default, there may be financial consequences. The process should include:
   1. The determination of whether there is a breach of contract by either party
   2. Procedural notification requirements

## Conclusion

Successful project completion does not happen by accident. A successful project requires both proactive and reactive contract administration. To meet the project goals, a proactive contract administration plan outlining the steps for success must be developed. After contract award the contract administrator must be adept at dealing with and reacting to situations that typically occur during contract performance.

## Synonyms

Contract monitoring/management failure; Contracting failure

## Definition

Contract administration is "the effort undertaken by both buyer and seller to ensure that the terms and conditions of the contract are being complied with. . .[including activities such as] monitoring the contractor's progress, inspecting deliverables, evaluating progress payments, and approving invoices" (Engelbeck 2002, p. 146). Serious problems from the government and vendor sides can occur in the course of administering a public contract; these problems may increase price, cause delays, or threaten completion of the contract as agreed.

## Introduction

The environment of government contracting is intricate. While government contracting presents great potential opportunity to vendors and considerable worth in expertise, product quality, and value to the government customer, contracting in the public sector may nevertheless present a variety of unique challenges to offerors, awarded vendors, procurement staff, and the agencies themselves. Many of these challenges are characteristic of the intensely regulated context of public procurement (Walker 2003).

Special attention should be paid to the matter of contract administration, but administration is sometimes overlooked when resourcing a public purchasing/acquisitions function. While the right writing of requirements, solicitation of responses,

and contract award are all important, it is through contract administration in the post-award phase that the public actually receives the products or services for which it is paying. Contract administration, as the implementation phase of the contract process, is "the effort undertaken by both buyer and seller to ensure that the terms and conditions of the contract are being complied with. . .[including activities such as] monitoring the contractor's progress, inspecting deliverables, evaluating progress payments, and approving invoices" (Engelbeck 2002, p. 146). Johnson wrote that "Within the contract document, and then during implementation, key indicators measuring the delivery of the contract inputs, outputs, payments, and outcomes should provide both the procurement professional (on behalf of the entity) and the contractor with a plan for achieving success" (Johnson 2017, p. 445).

As with many aspects of government, the best laid plans in contracting may not unfold as expected. During contract administration, problems can arise from bureaucratic inefficiencies, and latent problems present in the specifications and the contract itself, but vendors are also responsible for concerns. This entry considers contract administration problems and their causes, resolution of contract administration problems, and concluding thoughts on contract administration and its importance.

## Contract Administration Problems and Their Causes

Contract administration problems have as their source a failure, to some extent, to procure "the right item, in the right quantity, for the right price, at the right time, with the right quality" (NIGP 2000). These are related to various risks, as identified by Davison and Wright (2004), regarding proposal, liability, scheduling, contractual issues, acceptance/performance, and price risks. As examples, specifications may not be clear, and as a result, implementation of those specifications results in problems. A vendor's failure to perform may not be covered by liability insurance. The requirement itself could invoke challenges, as with the involvement of new technology, or when products or services are not provided with agreed quality (Davison and Wright 2004).

According to Davison and Sebastian (2009), the most common perceived contract administration problems were "delays; cost; change order[s]; poor performance; [and disagreement about the] definition of acceptance" (p. 273). Delay in delivery of product or service is a problem when it occurs in any contract. If a contract amendment is required, administrative avenues for processing such a request and navigating levels of approval authority can introduce delay (Reining 1959). Costs can spiral out of control, well beyond the amounts budgeted for requirements (Savas 1979).

When many contracts, especially information technology contracts, fail during contract administration, the cost associated with contract failure makes rendering due regard to contract administration concerns especially appropriate (Davison and Sebastian 2009). Problems experienced tend to vary with the type of contract and product/service procured. Certain types of problems, such as receiving the wrong product, are more obviously associated with supplies/commodities contracts. Other problems, like change orders and delays, are more often related to construction contracts, though change orders also adversely affect professional services contracts (see Davison and Sebastian 2011, for more detailed information about problems associated with specific types of contracts).

It has been suggested that vendors make the already difficult job of completing a government contract even more trying through "failure to understand contract terms, lack of experienced contract advice, and inexperience in dealing with government officials during crisis periods" (Walker 2003, p. 38). Many difficulties in contract administration have their origins in confusion about contract conditions – understanding what they mean and interpreting them properly (Sturgill and Vorster 2006). Failure to read the solicitation and the contract, and lack of communication with government representatives, have also been identified as critical points that could cause or heighten problems during the administration phase (Walker 2003).

Problems encountered in the course of contracting are myriad. They are particularly noticeable when the government representatives lack skill, expertise, or systems to perform their function acceptably. For example, in an instance involving the United States Department of Energy, "field personnel overly relied on contractors' accounting systems and contract-collected data in assessing performance, without significant validation of those data" (GAO 2005, ii). When agencies and personnel rely on vendor data and analysis, it becomes more difficult to know what has been purchased and supplied and challenging if not impossible to verify this information independently. A tendency may exist for government personnel to focus more on the pre-award phase, with its solicitation of requirements and award of contracts. While these activities are without doubt important, too much attention to the pre-award phase of contracts in an agency's portfolio may leave little time for administration. This can lead to cost overruns among other deviations (GAO 2005).

In their discussion of transportation public-private partnerships, Lawther and Martin observed that "insufficient incentives will exist for private partners to achieve optimal performance," unless the performance management system in place contains "KPI-related performance standards that reflect agency, regional, and larger societal goals, as well as project-related goals" (Lawther and Martin 2014, p. 220). The administration role is important in situations involving incentives, as the administrator should allow for incentives only when doing so is appropriate (Johnson 2017).

Research has shown that the presence of long-term relationships can affect whether and how government entities impose sanctions for contract problems; this is perhaps contrary to the formalized contract document and its prescriptions (Lamothe and Lamothe 2012). Favoritism and differences in how contractors are treated can seep into a contract administration program. In the administration role, a tendency for the government representative may be to seek to advocate for the vendor to achieve the outcome, but in those instances, it is essential for the representative to first remember who writes his or her paycheck and then to carry out the administration task in a manner that best represents the interests of the *government* client. Outcome is important, but ignoring rules that help sustain the integrity of the procurement system does not strengthen the system over the long term and can lead to creation or maintenance of an environment favoring corruption.

## Resolution of Contract Administration Problems

Fernandez (2009) offered that "contracting outcomes should be improved when a public agency is staffed with personnel trained in contract administration and capable of preparing bid documents, evaluating bids, handling questions posted during a prebid conference, monitoring performance, and dealing with complaints and performance problems" (p. 82). It has been offered that "contract management capacity, together with political factors, helps to account for variations in government contracting" and that "higher levels of contract monitoring capacity" are associated with "adequate monitoring systems and the personnel trained to operate them" (Fernandez et al. 2008, p. 454). Contract administration goes beyond enforcing the contract from the government entity's side – attention must be paid to the objectives of the program and achievement of the outcomes intended (Davison and Sebastian 2011).

However, contract administration problems are rooted, sometimes deeply, in issues of organizational behavior, personnel capacities and skill adequacies, beliefs, and lack of incentive. When a procurement professional does not have contract administration experience, some difficulty in working through the process may be assumed. A failure to track progress of a project may be technological (lacking a system to do so), or it may center on the insufficient skills, or lack of will to perform the task on the part of the staff member. Leadership in the organization may be lacking. Beliefs that defend the government entity, but unfairly disfavor vendors, can create project

delays that threaten agency outcomes (Sebastian and Davison 2011). Without adequate government staffing to monitor contracting during contract administration, in the presence of moves toward increased privatization of what were formerly government services, the idea of accountability in public procurement may be little more than symbolism and empty promises (Fine et al. 2016).

Whether or not problems are foreseen in administration of a contract, there should be some effort to ensure that parties have common understanding and interpretation of contract terms (Sturgill and Vorster 2006). Adjustments to existing processes can create problems elsewhere for administration. Changing delivery options, for example, may create problems in the post-award phase, so it is important that "contract administration procedures for facilitating [new approaches] are well defined" (Migliaccio et al. 2008, p. 499).

Some administration problems are caused by predilection for administrative ease, or avoidance of conflict with vendors, which can interfere with accountability. Piggybacking on others' existing contracts, or advocating for a sole source, can result in bad pricing; time and resources may be saved in noncompetitive processes, but the savings could be illusory if a better deal was possible (Bates 2010). Ideally, contracts should be structured in a manner that shares risk between vendor and government entity, so that achievement of targets will be adequately incentivized. Performance standards should not be too easy to meet, as would be the case in a pass-fail scenario (Lawther and Martin 2014).

When problems, and concerning tendencies in processes, are identified in contract administration, it is worthwhile to institute a program of periodic review to see whether identified issues are being resolved appropriately (GAO 2005).

## Conclusion

An important part of the work of contract administration is managing the expectations of diverse stakeholders (Johnson 2017). Contract administration problems can create considerable waste of resources, delaying or even preventing the achievement of important government functions. Recognizing relatively minor issues that exist in the contracting environment and in its instruments, which may eventually grow into contract administration problems, may be key to reducing or eliminating threats. This can help reduce risk for the government entity and provide for a positive environment for government vendors where all parties may achieve success.

# Contract Design

Benjamin M. Brunjes
University of Washington, Seattle, WA, USA

## Introduction

Contracts are "business arrangements between a government agency and a private entity, in which the private entity promises, in exchange for money, to deliver certain products or services to the government agency or others on the government's behalf" (Kelman 2002, p. 282). In America, contracts date to the nation's earliest days, when private businesses supplied George Washington's Continental Army. In recent decades, political interest in possible market benefits associated with privatization has spurred the use of contracting as a tool for public service delivery. In particular, market competition is believed to drive down prices, encourage innovation, and increase accountability (Savas and Schubert 1987). Simultaneously, it is widely believed that governments can cut administrative costs through contracting, particularly expenditures associated with personnel management, salaries, and pensions (Osborne and Gaebler 1992).

Despite being one of many policy implementation tools, contracts are essential for public administration. Public managers operate in a system in which contracting is common and possibly inevitable. However, scholarship in public administration has tended to focus on the decision to contract out (the make or buy decision) and ideologically based arguments about the appropriateness of contracting in the public sector. Despite these debates, contracts are here to stay, as public agencies are more reliant than ever on private partners for the design, development, and delivery of public services. As a result, government managers need more and better strategies to help successfully design contracts, an area where scholarship has been particularly limited. To help fill this gap, this entry introduces contract design, summarizes existing public administration research on the topic, and identifies some of the most pressing research questions for scholars to pursue.

## Contract Design

As a result of intentional deliberation and negotiation, strategic plans set the direction for many public organizations (Bryson 2010). Empirical evidence suggests that public organizations are increasingly strategic, working under the guiding values of a mission statement, attempting to reach a vision of improve conditions, and meeting a range of goals and objectives that serve as milestones between today and that better future (Andrews et al. 2006). Recent meta-analyses suggest that this approach to strategic management can improve organizational performance and other administrative outcomes (George et al. 2019). That is, careful planning and projections of future needs and expectations can have meaningful effects on organizational outcomes.

Contracts are strategic vehicles, as they generally describe the overarching purpose for the work (akin to a mission), outline the proposed results (the vision), delineate work requirements and performance measures (goals and objectives), and create processes to manage and evaluate performance (implementation steps). Like organizational managers that dedicate time and resources to planning, drafting, and socializing elements of a strategic plan, contracting officials should be attentive to the details of a contract before it is solicited or signed. The effort to plan and specify contract details, including descriptions of planned activities and anticipated processes, is called contract design. Occurring after the decision has been made to contract out for a good or service but before a contract (or solicitation) has been released, contract design refers to a strategic approach to developing contracts, including the defining expectations, establishing key processes, and identifying conditions of success. During this phase of contract management, public contracting officials wield significant discretion over many important elements of contracts that, if addressed carefully ahead of time, might affect the solicitation, selection, oversight, and performance of a contract. These details often manifest as critical components of solicitation documents, such as requests for proposals (RFPs) or quotes (RFQs), as well as in the signed and executed contracts themselves. It is in the composition of these details that public managers can alter the purpose, structure, and performance of the contract (Curry 2016). For this entry, I focus on the two aspects of contract design most studied in public administration: (1) the specification of work requirements and (2) the establishment of solicitation and management processes.

First, the government must identify and explain what is needed. Contracts usually begin with some description of the background of the work to be done, including important contextual details, descriptions of relevant government organizations, and a summary of the overarching purpose for the work. These are followed with a detailed description of the work requirements. In these early sections of the contract, managers define the mission and vision for the contract, as well as particular goals and objectives that contractors must achieve over the period of performance. These can include reporting requirements, work products, or a particular impact (as performance-based contracts might specify). There is evidence that donors to nonprofit organizations use mission and vision statements to ascertain whether an organization is worthy of investment (Voeth and Herbst 2008). Similarly, vendors use these early sections of an RFP or RFQ to build their understanding of fit: can their organization meet the need, and are they interested in working in the context described? Waller et al. (2016) describe an RFP as a "user guide" that offers bidders insight into expectations, pricing, project management, and invoicing, all important concerns for vendors. The list of requirements provides insight into how the contract might mesh with the contractor's own strategy, particularly in terms of new investments (human capital, facilities, etc.) and the potential profitability (and risks) of the work. Well-designed contracts will present clear statements about the purpose of the work, the vision at its completion, and a roadmap for how the contractor will get there (or, alternatively, allow the contractor to submit such a plan).

There are few existing studies in the public administration literature that explore the importance and impact of the wording of contract requirements. Waller et al. (2016) perform a case study analysis of a single contract to provide insight into tools and templates that might be useful for other solicitations, finding that clearly defined requirements facilitate vendor understanding and willingness to bid. Harris (2020) investigates the linkage between requirements and public participation in the context of international development contracts, finding that clearly specified delegation of authority leads to greater input from less empowered actors. While these studies indicate that clarity has benefits, additional studies on the design and presentation of requirements are necessary.

Second, design elements written into contracts specify the processes that govern the solicitation of vendors and the management of the contract. Where the requirements establish priorities for the work and general strategy to be employed,

process components describe how the contract will be implemented. Implementation has long been neglected in strategic planning initiatives (Bryson 2010) and has been similarly undervalued in contract administration (Petersen et al. 2019). Process design elements include determining how to:

- Market solicitations to vendors (online, in-person, on bulletin boards, etc.)
- Solicit proposals from potential vendors (competitively, sole source, or somewhere between)
- Establish criteria and procedures to evaluate proposals (negotiation, cost, quality, etc.)
- Structure the financial obligation between the government and its contractor, including the application of incentives
- Exchange information between the parties to the contract during the period of performance, including establishing and monitoring performance criteria

Despite procurement rules that are perceived to be relatively constraining, many contracts cannot be fully specified ahead of time, due to incomplete knowledge about work requirements and the possibility of contextual changes. As a result, public managers wield a great degree of discretion over these design elements, meaning that many of the most important decisions about day-to-day contract management are the result of the application of administrative expertise and technical training (Brunjes 2020b; Christensen et al. 2011). Malatesta and Smith (2014) find that public managers design more flexible contracts when there is high work complexity and unpredictability, indicating that managers anticipate potential problems and build in mechanisms to allow redirection.

There have been a few recent studies on contract process design, largely centered on contract type, the use of financial incentives, and market interactions. Contract type refers to the choice between a fixed-price contract and a cost-reimbursement contract, which balance risk and performance incentives differently. Fixed-price contracts encourage firms to complete the work on a contract under budget to maximize their profit, boosting efficiency. Cost-reimbursement contracts incentivize firms to bid on less certain government work by guaranteeing remuneration for time, labor, and other expenditures. Malatesta and Smith (2011) examine 175 Environmental Protection Agency (EPA) contracts to determine if dependence between principal and agent influences contract design. They conclude that relationships affect contract design and that public managers alter the financial structure based on the market that they encounter, with cost-reimbursement contracts used to incentivize bidding. Kim and Brown (2012) look at contracts from three federal departments over a 5-year period to assess descriptive patterns in the financial structure, length, and funded value for complex contracts. They find that short-term, fixed-price designs are the most frequently used, potentially allowing for greater competition and public sector risk reduction. Brunjes (2018) investigates what affects the selection of contract types and their relationship to contractor performance, analyzing nearly 25,000 complex federal contracts that ended between 2005 and 2014. Results indicate the federal contracting officials tend to use fixed-price contracts more commonly, especially for simpler, easier to measure projects. Fixed-price contracts also tend to perform better than cost-reimbursement contracts, being considerably less likely to terminate early or to see cost overruns (Brunjes 2018).

Financial incentives are another important element of contract design. Though the tendency is to focus on financial penalties and rewards, non-financial, informal incentives such as verbal appreciation, public commendation, and scolding are also commonly used (Girth 2017). Based on a series of interviews with local-level contract managers, Girth (2017) discovers that public contract managers often use financial sanctions to address performance problems but are reluctant to terminate contracts. Financial incentives are less likely to be used to inspire good performance, which may be due to a combination of political and managerial factors (Girth 2017). These findings are supported by additional work by Girth and Lopez (2019) which analyzes more than 200,000 federal contracts, finding that incentive contracts

are not more efficient or better performing than other types of contracts. Taken together, these findings suggest that formal incentives are uncommon and that incentives in general may have a limited impact on contractor performance.

Competition is another process that has featured in recent scholarship. Contract managers make the determination about whether and how to interact with vendors and marketplaces. In recent years, the popular press and applied analyses have highlighted the lack of competition over many government contracts, and the academic literature has struggled with the balance between relational contracting (which limits competition to lower transaction costs) and the pure theoretical benefits of market competition. (For example, see https://thehill.com/blogs/pundits-blog/economy-budget/344829-rampant-use-of-no-bid-contracts-is-the-essence-of, which highlights both ethical and practical downsides of sole source contracting. From a practitioner perspective, the Government Accountability Office (GAO) has released a series of studies on problems with competition, especially within the Department of Defense. See, for example, https://www.gao.gov/products/GAO-19-691, and https://www.gao.gov/assets/660/653404.pdf, among others.) Contract administrators must determine whether to pursue full and open competition, use set aside procedures to compete within an exclusive group of contractors (disadvantaged businesses, nonprofits, etc.), or pursue a sole source (noncompetitive) contract. In this decision, accountability, efficiency, equity, and performance goals may clash, as managers weigh the relative importance of rule adherence, cost, relationships, and inclusion.

Shetterly (2000) assesses the impact of design on performance of trash collection in 41 localities around the USA and finds evidence that competitiveness can increase the costs associated with managing contracts, especially costs associated with solicitation and proposal evaluation. Atkinson (2020) finds that, despite an official commitment to full and open competition, federal agencies are responsive to market conditions and project complexity when making the decision to compete. As a result, the ethical commitments of public agencies are murky, balancing performance objectives with broader equity considerations. Brunjes (2020a) analyzes federal contracts to assess what leads to competition and whether competition affects contractor performance. Findings indicate that public contract managers are responsive to market strength, competing contracts where markets are robust. Yet, competition is not associated with better contractor performance. Instead, relationships and the alignment of goals between government and its contractors are better indicators of good performance. Taken together, these studies offer evidence that government contract managers use their discretion to design processes to lower transaction costs, mitigate risk, and preserve critical relationships with vendors and political overseers.

## Next Steps

Public administration research on government contracting has been challenging. Data is notoriously hard to find, as governments use a range of platforms and methods to report contracting activity. As a result, datasets are often incomplete and comparison between jurisdictions is hard. At the same time, comparison between different types of goods and services is also tricky, as it is difficult to identify similarities between types of purchases, which range from simple commodities to complex services and advanced weapons systems. To overcome these problems, studies have largely used cases, cross sections, and perceptual surveys. Much of the resulting research has been correlational and often applies inadequate or insufficiently vetted measures for critical concepts like complexity, process, and performance (Kim et al. 2016). Finally, contracting scholarship has suffered from theoretical myopia, dominated by concepts from agency theory and transaction cost economics. The resulting field is highly limited practically and theoretically, as it is based on suspect research methods and too narrowly focused. Contract design offers scholars the opportunity to expand the study of government contracting into areas where better data is

available, where additional theoretical lenses are useful, and where direct links can be made to broader topics of practical and scholarly interest such as planning, implementation, and performance. There are three primary areas where additional scholarship is needed.

First, additional studies of contract requirements are needed, including how they are generated, what they signal to vendors, and how they affect contract outcomes. Both active and archived solicitations, complete with requirements, are often publicly available on government websites. With the rise of predictive text analysis methods, it is now possible to generate, categorize, and analyze large *n* datasets of requirements. Such analyses would advance our knowledge of the planning process, generate new datasets for future studies, and facilitate the development of theoretical and practical knowledge about how to craft requirements that promote accessibility, accountability, equity, and performance.

Second, scholars should build a better understanding of the solicitation process, including issues of search, screening, and bargaining. Well-designed contracts will establish solicitation procedures to guide market interaction and negotiation, including staffing needs, a communication plan, and proposal evaluation criteria. Little is known about any of these aspects of government contract management. Understanding the impact of leadership, culture, role behaviors, communication, and participation on contract design and decision-making would tie contract management literature into broader literatures on organizational behavior and relationship-building across sectors and organizations.

Third, additional studies are needed to link design elements to management and performance. Design and planning are important because there is evidence that they affect processes and outcomes (George et al. 2019). There is early evidence that contract design elements like financial structure, incentives, and performance affect contractor performance (Brunjes 2018; Girth and Lopez 2019; Brunjes 2020a), but more work need to be done to establish causality and to present evidence of similar connections for other aspects of contract design, such as marketing, solicitation, and negotiation.

Contract design is an important yet understudied area of public administration scholarship. As government contracts have become more complex, public administrators wield increasing discretion over decisions about how to structure contract solicitation, proposal evaluation, and management. Though there is early evidence that these decisions affect contract outcomes, additional research is needed to generate datasets and develop new measures to help alleviate some of the problems that have long plagued contract management scholarship. Design elements such as competition, financial structures, advertising, communication, and evaluation may offer the chance to identify comparable measures, enhance practical impact, and form links with new theoretical perspectives. Contract design is a fertile subfield with the potential to generate theoretically sound and practically valuable studies over the coming years.

# Contract Management Capacity

Shimaa Elkomy
Research Fellow, School of Economics, Surrey Business School, University of Surrey, Guildford, Surrey, UK

## Synonyms

Contracting out; New public management

## Definitions

| | |
|---|---|
| Contracting out | A mode of privatization where governments seek to delegate a private entity to manage some public services and operations while retaining ownership and overall control. |
| Contract management capacity | This includes all activities by public administration that involves dealing with a private provider to outsource a service that was initially performed by in-house public team such as bidding, designing a contract, measuring performance, consultations, and collaborative management. |
| Contestability | This refers to the possibility of replacing a private provider with another supplier in case of increase costs or significant quality deterioration in service delivery, hence the cost of entry and exit of a provider from a contract reduces the contestability of the service. |

## Contract Management Capacity: The Case of the UK Public Services

Competitive tendering and contracting (CTC) is a mode of supplying services through a

competition between an in-house team and one or more private contractors through tendering (Domberger and Jensen 1997). Contracting out refers to the provision of a public service by a private service provider that had previously been supplied by an in-house team. Supported by management theory, contracting out of public services has been promoted since the 1980s as a mechanism for reducing public expenditure and focusing on improving the quality of their core services. Governments since then relied on contracting out as the main mode of cooperation with the private sector with the purpose of cost reduction, improvement of outsourced quality of services, and introducing competition with its efficiency effects. As such, it is a legal requirement for many public services to be tendered. While public administration theory contends the enhanced productivity and improved quality of contracting out due to specialization and high-powered incentives of the private sector, many insights cast doubts on the effectiveness of contracting out. There are both theoretical and empirical reasons to believe that under incomplete contracts and with unobservable quality, private providers have an incentive for quality shading. Since the 1980s the private sector has played an increasing role in the provision of public services, based upon the argument that it would increase efficiency through the introduction of competition. There is a considerable literature that compares public and private provision and it largely, although not universally, finds greater cost efficiency under private provision (e.g., Domberger et al. 1995; Megginson and Netter 2001). Driven by competitive forces and profit-maximizing behavior, private sector firms drive down costs because their shareholders are the residual claimants on any profit. This can be at the expense of service quality (or other related characteristics) if this is unobservable or impossible to fully define. This is the well-known problem of incomplete contracts (Grout 1984).

It is argued that government management capacity can affect the outcome of contracting on quality of public services. Contract management capacity comprises all the skills and expertise that the government requires to manage conflicting interests. Brown and Potoski (2003) argue that the failure of contracting out of public services that results in sacrificing quality for cost savings might be related to the public management capability to evaluate the feasibility of contracting. Effective contract management might result in better evaluation and monitoring for the implementation of the contract. Although there is no evidence of how contract management capacity could affect the quality of contracted services, it is believed by public administration that this developed capacity can deal with some problems of contracting like accountability and monitoring problems (Walker et al. 2013).

The English governments spends more than £90 billion yearly on contracted out goods and services; however, there is clear evidence from extended investigation by the House of Commons (2014) that the government has done very little in improving contract management capacity and consequently failed to deliver high-quality contracted services. It has been concluded that the government clearly lacks the suitable legal, managerial, and financial skills to manage the whole contracting process. It seems that the government is overlooking the process of contract management and assigning this task to junior managers who restrict managing contracts to following up private providers rather than closely working with them to facilitate solving operational problems and the delivery of high-quality service. Moreover, public administration sometimes are not aware of the private providers' operations and service delivery process; consequently monitoring of performance and quality outcomes could be challenging. There are four giant private providers (Atos, Capita, G4S, and Serco) who control major outsourced public services. In recent years, public confidence in the ability of these private providers to supply high performance standards and attain quality outcomes has been undermined by numerous scandals of poor performance, lack of measurements that reflect real quality outcome, and little public accountability for private providers in case of quality failure. There are numerous cases of high profile failure of contracting out of public services in the English Government, for instance, the recent scandals of G4S and Serco of years of overcharging on

electronic tagging contracts and the failure of Capita to provide reliable translation services in UK courts and the clear disappointment of G4S in providing security services for the Olympics. In addition, there has been several calls to open up the market for contracting out for more companies operating in smaller scale to introduce more competitive forces, innovation, and contestability (the ability to replace the contractor in case of quality shading).

The report shows that contracting out has been always undermined by transparency problems where only 30 percent of contracts allow public access to full accounting and costing reports of private providers (House of Commons 2014). Moreover, the business for privately providing government services is dominated by limited number of firms which has recently witnessed significant growth in market share through acquisition of other competitors which sometimes hinders the government to replace the private providers in case of poor service delivery.

There is a consensus by literature that feasibility assessment capacity, implementation capacity, and evaluation capacity are the three areas of improvement for contract management capacity (Brown and Potoski 2003; Yang et al. 2009; Kim and Brown 2012). The feasibility assessment capacity is the ability of public managers to decide about the rationality of the decision to contract out certain auxiliary services to focus on core services and whether there is enough competition in the market resulting in efficiency effects. This implies the understanding of public managers to the objectives behind contracting and the suitability for outsourcing in terms of market conditions and contestability of the service. This implies the possibility of replacing a contractor with a cheaper or higher-quality supplier that creates a competitive environment which lowers the cost and improves quality (Domberger and Jensen 1997). This stage is relevant as public managers feel in charge of the decision about whether to opt for outsourcing or not. The second stage is the implementation which requires public administration to possess the experience of bidding, negotiation, and designing the contract. This would include designing measurements for performance assessment, skill promotion for public managers (e.g., consultation with other organizations and collaborative management), evaluation of the whole bidding process and assessment of the financial position of the contractor, and the staffing capacity. Auction theory also contributes in explaining why contracting out could be problematic. Tenders may be arranged as sealed bids, or reverse auctions, where the tender goes to the lowest bid. In this case, the value of contract depends not only on the costs faced by the provider but also on their competitors' unknown prices. Laffont (1997) argues that in some extreme cases the uninformed bidder would have zero profits, known as the winner's curse. Milne et al. (2012) argue that contracting out might result in significant quality shading where there are large numbers of competitors and/or the information asymmetry is high. They argue that in-house teams may be more successful in delivering higher-quality standards after retaining a contract from a private contractor because they are well informed about the optimum value of service provision.

Hence the ability of public managers to have clear picture about the contractor, service specification, and contract design including contract value and terms of service provision is potent. Contract design is one of the most relevant components in contract implementation. Kim and Brown (2012) explain three elements of contract design which are contract type, length, and value that affect the outcome of the contracting out process. Contract type would include the means of compensating the seller which is either by setting a fixed price at the start of the contract that determines the total final cost of the product or by cost reimbursement claimed after the contracted service is delivered, and this would shift the risk to the government side as a buyer of the service. This implies that for cost-reimbursement contracts, the government should be specific about the characteristics of the delivered service as this will determine the final paid price. On the other hand, the service provider in

the fixed-price contracts is more incentivized to set the exact product specification that would determine his initially set price of the contract. Contract length is another element in contract design that is determined by the nature of the contracted service. Short-term contract that includes some possibilities of extension suits simple services with known delivery time. This would allow the public sector to exchange the service provider in the short run if the promised quality is not delivered. The third element of contract is the contract value which is determined in advance in case of fixed-price contracts and ex post in case of cost-reimbursement contracts. For short-term contracts, the value of the contract might be modified with the extending the period of the contract without incurring new transaction costs for rebidding or renegotiation.

Yang et al. (2009) add to the implementation capacity another stage which is required during the period of contracting where public managers are involved to some extent in service provision with the contractor to help deliver better quality of service. This comes in the form of regular meetings to assess any operational problems the contractor might face and ongoing collaboration to support the contractor. The third stage is related to monitoring and evaluating the performance of the private supplier through creating formal channels for monitoring of the contractors (e.g., inspections, regular evaluation, and satisfaction survey for the end users). The trust relationship between public administration and private providers is often associated with high delivered quality of contracted services as explained by Fernandez (2007, 2009). The latter studies show that building trust relationships and continuous working on solving operational problems evolving during the contract would lead to high performance outcomes. Brown and Potoski (2003) render poor-quality outcomes from contracting to insufficient management capacity in any of these areas.

While public administration might attempt to draw a specific description for the service and endeavor to quantify and measure the service, some service outcomes are intrinsically hard to measure and quantify (Walsh et al. 1997). Monitorability and designing of the contracts in the public sector needs high levels of skills and is encountered by significant degrees of uncertainty in assessing the ex post quality (Kim and Brown 2012; Yang et al. 2009). Van Slyke (2003) argues that when the costs of monitoring the compliance of the private contractors to the quality standards exceeds the cost savings of contracting out due to contestability and high-powered profit incentives, public provision might be considered more efficient.

In reality private providers are aware that the capacity of public managers to manage a contract and monitor their performance is lacking, and there are plenty of examples where public administration was well rating a provider for meeting all targets, while major quality concerns are on surface. Moreover, as explained by Girth (2014), private providers are confident that any quality shading in the contracted service will not be highly penalized by public administration or not even penalized because of the administrative burden of these processes, long legal procedures, and the transaction costs of re-tendering.

## Conclusion

Contracting out as a main pillar of the new public management has been the most popular form of service delivery with potential benefits including cost reductions, efficiency gains, specialization, and quality improvements. Our short essay discusses the relevance of contract management capacity to attain the productivity benefits and efficiency effects of contracting out in the public sector. This article sheds the light on some theoretical aspects of managing a contract and the means of improving these skills by public management. I also attempted to highlight some examples of failure of contracting out in delivering the pursued quality outcomes due to lack of understanding in the UK government for the relevance of developing a capacity to manage a contract with the private sector.

# Contract Management: Perspectives of Bureaucrats and Contractors in Hong Kong

Lina Vyas
Department of Asian and Policy Studies, Education University of Hong Kong, Hong Kong SAR, Hong Kong

## Synonyms

Civil service training; Contract management; Outsourcing; Stakeholder analysis

## Introduction

Training programs for civil servants have been increasingly decentralized, contracted out, or outsourced in Hong Kong. Although the perceptions of and the interactions among major stakeholders including bureaucrats and contractors form the basis for evaluating the effectiveness of contract implementation and management, the subject has remained largely understudied. In this essay, the bureaucrats in charge of contract management and contractors were interviewed. The findings indicate some mutually shared standards that need to be upheld for effective contract management, as well as some intriguing differences from diverse perspectives. The findings are analyzed by making use of five key attributes of effective contract management, which are drawn up based on the present literature. They include human resources, communication, information transparency, monitoring system, and compliance with requirements. The ultimate aim of this essay is to evaluate how effective

outsourcing contracts in respect of civil service training are implemented and managed by Hong Kong government.

## Background

Since the 1980s, outsourcing or "contracting out" has become prevalent in public sector management. Outsourcing refers to "a business arrangement between the government and a private for-profit or not-for-profit entity in which the private entity promises, in exchange for money, to deliver certain products or services to the government agency or to others on the government's behalf" (Kelman 2002a, p. 282). Various forms of outsourcing can be observed in Anglophile countries such as the United Kingdom, the United States, New Zealand, Australia and Canada, and recently in Asia. Despite the increasing popularity of outsourcing, the perceptions of and interactions among major stakeholders during the outsourcing procedure have not been extensively studied (Huque 2005; Kelman 2002a; Kettl 2010; Sclar 2000; Van Slyke 2006). This essay seeks to fill this gap by exploring the conceptions of the major stakeholders in the outsourcing process, namely the bureaucrats and contractors, toward effective contract management.

The perceived reasons for outsourcing and determinants of its success are affected profoundly by two strands of economic theory: principal-agent theory and transaction cost theory. They serve as the major vehicles of evaluation and analysis of outsourcing management in this article. Principal-agent theory refers to an arrangement in which one party (the principal) delegates work to another (the agent), who performs that work in behalf of the principal (Eisenhardt 1989). Principal-agent theory seeks to portray this relationship using the metaphor of a contract (Jensen and Meckling 1976). There are two basic assumptions: (1) human beings are rational, self-interested utility maximizers; and (2) the agent is more risk averse than the principal subjecting to fewer options and resources (Boston 2011). A principal-agent problem arises if the independent agent pursues other goals than those that the principal has in mind when launching the partnership with the agent, leading to increased coordination costs and reduced possibilities (Birner and Wittmer 2006).

Transaction cost theory entails an examination of the comparative costs of planning, adapting, and monitoring task completion under alternative governance structures (Williamson 1985). The assumptions are opportunism (i.e., using improper means to maximize one's own interest) and bounded rationality (i.e., people having the time and the cognitive ability to process only a limited amount of information on which decisions are based). Outsourcing, especially from the public sector to the private sector, is expected to enhance the quality of services at a lower price. The basic criterion for outsourcing services to private contractors is whether the likely benefits of complex contracts outweigh the transaction costs of executing the contracts.

## Five Key Attributes of Effective Contract Management

Other than merely a contractual arrangement, outsourcing requires proactive management of contracts if complex relationships between the buyer and the seller are to function well (Huque 2005; Yang et al. 2010). For contracting to be successful, effective contract management is essential. Kelman (2002b) argues that contract administration is an important part of the management function. If not, the task of contract management will be "dumped on poor performers" (officials) because it is not "a high-prestige task."

The fundamental challenge of outsourcing is to discover more effective strategies to ensure that it functions well. According to Kettl (2010), contract managers should be able to understand the issues facing contractors and the tasks that they have to perform, respond to complications swiftly as a negotiator, and steer contracts in the directions required by government policies. What is equally important is the presence of an effective system to assess the performance of contractors so as to establish a transparent contracting-out process, and strengthen the capacity of the

government as a "smart buyer": deciding what goods and services are needed, how they are designed and how well they work. It implies the need for evaluating the performance of contractors in different ways, including physical spot-checks, performance reviews by bureaucrats, customer satisfaction surveys, focus groups, external and independent audits, and joint reviews.

Based on principal-agent theory, it is important to manage relationships by overcoming the challenges in ensuring that contractors act in the interests of their shareholders. When ownership and control are separated in an organization, a string of agency problems such as violations arising from opportunistic behaviors can arise, and buyers ought to develop the evaluation capacity, which is the capacity of monitoring and evaluating the performance of contractors in order to determine if they are fulfilling the responsibilities specified in contracts (Brown and Potoski 2003). If agency problems are overcome, outsourcing will enable the government to gain both flexibility and the expertise, which is otherwise hard to access or to develop by itself.

Based on the literature, five attributes of effective contract management are as follows: human resources with contract management skills, communication, information transparency, monitoring system, and compliance with requirements.

## Data Collection

Our study seeks to identify how the processes involved in contract management are understood and conceptualized by the principal (i.e., bureaucrats responsible for managing outsourcing contracts) and the agent (i.e., contractors in the private sector). The data were collected in two stages: a questionnaire with 125 government departments and 250 contractors, and an in-depth interview with a sample of 10 bureaucrats holding senior or executive positions at the HKSAR Government, and 10 contractors. There were two sets of questionnaires designed specifically for bureaucrats and contractors respectively to reflect their different roles in the outsourcing process. As for the interview, interviewees were selected by making use of snowball sampling, i.e., interviewing a few individuals at the outset and asking each individual to identify others who should be interviewed. Each interview lasted for approximately one hour and the interview data were recorded. The interviewees were asked open-ended questions covering the four main issues listed below. Such questions were designed to elicit their experiences and perceptions of contract management.

1. General opinions about a good contract management
2. Experience of trainings for contract management
3. Relationship between the government and the contractor
4. Opportunities and challenges encountered in contract management

The interview data were then transcribed to identify any variations in the conceptions and perceptions of the bureaucrats and contractors. In general, most of the contractors (64.8%) had 5-to-10-year experience in dealing with government contracts. The vast majority of them (95.7%) undertook government contracts that lasted for 3–5 years. The major ranges of services outsourced to the private sector were human resources management (HRM) (41.4%) and building and property management services (34.6%). Nearly all of the bureaucrats (93.8%) confirmed that outsourcing had been adopted in their departments, among whom 63.9% regarded outsourcing as a successful strategy of managing human resources.

## Results

The questionnaire and interview data indicate that the interviewees from both the public and private sectors considered five main attributes essential for effective contract management:

1. Human resources equipped with the skills to handle contracts (human resources)
2. Good communication in the contractual relationship (communication)

3. Transparency and reliable information to assess the capacity of service delivery (information transparency)
4. An effective monitoring system (monitoring system)
5. Compliance with contract requirements (compliance with requirements)

The research data were further analyzed and classified into three types of conceptions, namely, solely from the bureaucrats' perspective (Conception 1), solely from the private contractors' perspective (Conception 2), and a perspective commonly shared by both the bureaucrats and private contractors (Conception 3). The research data were summarized in Table 1. Our findings show that the parties shared similar views in several areas such as Human resourses, Communications, Monitoring system, etc. Other than those areas, they held rather distinct views mainly because they viewed from different angles or perspectives based on their interests. The similarities and differences are discussed in the sections that follow.

## Conception 1 by Bureaucrats

The bureaucrats perceived contract management as a tool for facilitating the divestment of noncore government functions. While almost 80% of the responding bureaucrats were satisfied with their relationships with private contractors, many of the bureaucrats considered the strategy of contracting-out and the processes of contract management important for ensuring that cost effectiveness would be achieved when divesting government functions. A bureaucrat highlighted:

> . . .Government expenditure can be curbed, and the unavailability of expertise or expertise that is manifestly inadequate to tackle the task in hand can be dealt with within a short time.

Among the bureaucrats surveyed, almost all (94.8%) agreed with that the government enjoyed a more advantageous position in negotiation. Other views of bureaucrats are elaborated below in terms of five attributes of effective contract management:

### Human Resources

Some bureaucrats mentioned that no comprehensive training was arranged to them before taking up outsourcing contracts, which made it difficult for them to manage the contracts effectively. Instead, they had to study the contracts by themselves through studying government circulars, and rely on their own judgment or personal experience to make decisions. One bureaucrat remarked:

> I often rely on my own judgment and experience . . . I can assure that none of my peers has been given any relevant training, even though they are handling contracts.

Another bureaucrat mentioned that having the right person to deal with contractors and manage contracts was important, particularly when they had no hands-on experience:

> Those dealing with contractors are just petty administrators wearing straitjackets. Even if there is two-way communication, it does not guarantee good service standards . . . [t]here is no way that this complex process (of contracting out services) can be carried out in the absence of proper communication (between contactor and contractee).

### Communication

Proper and regular communication in terms of "3Ps" (i.e., performance, progress, and people) was also regarded as essential to avoid contract failure. The bureaucrats reflected that email was the most common means (43%) of daily communication with service providers; 21% of them would telephone contractors daily; and another 37% would do so once a week. Face-to-face meetings or letter correspondence were less common.

### Information Transparency

Given that bureaucrats had imperfect information regarding tenderers' capacities and track records, they were concerned about how to assess the capacity of private service providers, and how to adhere to the procurement requirement of selecting the lowest bidders. One respondent suggested that while the practice of selecting the lowest bidders was to ensure that government resources would be more effectively

utilized, there were other risks associated with the practice:

> In order to win the contracts, contractors have to offer extremely low prices, making it difficult for them to keep up with the quality of services promised. Moreover, the attraction of contracts can result in corruption (between government employees and contractors).

### Monitoring System

Some respondents reflected that the monitoring system in place was not always effective, making it difficult for them to implement contracts as intended:

> Addressing contract related problems is a very demanding task. Enforcing performance against the standard service levels is impossible to measure in certain cases.

In addition, the length of contracts has some implications for the market and effective monitoring. One bureaucrat remarked:

> [i]f the contract is too long, it will make contractors highly monopolistic ... [a] shorter government contract is a possible solution to monopoly because it is likely we can more closely monitor services by contractors.

### Compliance with Requirements

Many felt that it was important (62%) to establish service standards against which the contractors' performance could be assessed. Likewise, giving contractors clear directions as to how they should handle emergencies was also considered as critical.

## Conception 2 by Contractors

Conception 2 focuses on the contractors' perceptions of contract management. The contractors were generally more concerned about the sustainability of their contractual relationship with the government than the quality of services actually delivered. As regards the factors that might affect future outsourcing, the contractors shared different views, although approximately 40% of them found longer service contracts and a bigger contract size (i.e., bundling of small and related outsourcing contracts to increase the contract size) significant. In contrast, more than half of the contractors strongly opposed the introduction of any additional measures that might intensify bureaucracy, such as new provisions for contract exclusions and renewals.

### Human Resources

The contractors were concerned about protecting their human capital and their position as cost-effective specialists to maintain their competitiveness in their field. Some contractors reflected that the government did not seem to recognize contractors' lack of knowledge about government rules and procedures could become an obstacle to effective service delivery. One contractor made the following suggestion:

> We would appreciate basic training on the composition, practice and style of the government departments. This type of awareness and familiarization session is absent in Hong Kong.

### Communication

Many contractors weighed communication higher than reporting on the progress of work or delivering services. They suggested that bureaucrats should communicate with them more clearly and on a timely basis so that they could understand what the bureaucrats expect and need, and any changes in contract requirements. Two bureaucrats remarked:

> Communication does exist, but normally there is a delay as there is always a lack of prompt interaction.
>
> Owing to the privacy issue of the government, some important issues are not disclosed and communicated clearly. Hence, this makes our position difficult.

Some contractors were frustrated because of failure in communication or inconsistencies of practices across government departments. One contractor stated:

> [these problems could] cost us our reputation even though it is not our fault. Government interference results in project delay, which ultimately costs us a lot. Instead of making profits, we end up facing losses.

### Information Transparency

Those contractors with a long contractual relationship with the government hoped that government

rules and regulations would be made transparent so that they could enhance their offers during the negotiation process because "[i]nformation about those rules is essential for determining the scope of bargains."

#### Monitoring System

The contractors highlighted that knowing more about the system and frequency of checks could help improve service provision. One contractor commented that working for the government would be less demanding if they were "aware of the duration and frequency of monitoring" and, as a result, they could "start preparations well in advance."

#### Compliance with Requirements

Some of the contractors recognized the importance of complying with government requirements. However, they also realized the merits of government contracts. One of them remarked:

> Government contracts may involve more paper work and formalities, but working with the government is secure in nature. We have become trustworthy contractors since being endorsed by the government.

According to one-third of the contractors, the security of government contracts, high contract values and long contractual periods made government contracts attractive. At the same time, however, nearly 60% of the contractors did not find government contracts open, fair, stable, or secure.

### Conception 3 by Both Bureaucrats and Contractors

Conception 3 reflects the values generally shared by both bureaucrats and contractors. They are mainly related to issues that affect both efficiency of service delivery in the short-run and sustainability of service provision in the long-run.

#### Human Resources

Both bureaucrats and contractors agreed that efficiency of service delivery in the short-run and sustainability of service provision in the long-run were important. Establishing or introducing computer systems will make the monitoring mechanism more effective.

#### Communication

Most of the respondents were concerned about the lack of communication in establishing contractual relationships. This had less to do with the existing communication channels but rather reflected a belief that both parties should develop better mindsets and a stronger sense of shared accountability for service performance. One bureaucrat remarked:

> Accountability is a double-edged sword. It can enhance or hinder service performance and outcomes. The right mindset of all parties involved, i.e. the government administrators, service providers, members of the public, etc., is most important.

#### Information Transparency

Both parties agreed that having a known and predictable environment was beneficial, and they added that information transparency would help them evaluate and plan budgets, and manage risks better.

#### Monitoring System

Several bureaucrats highlighted the need for better a monitoring system for expenditure estimation to facilitate better financial resources planning. Better communication and information transparency would help contractors evaluate the risks entailed and evaluate their ability to deliver services. A bureaucrat commented:

> Contractors sometimes offer extremely low bids to get a contract, which gives rise to various contract complications. Developing a system for systemically recording their histories will be helpful for the selection of contractors in the future.

The contractors, however, were not supportive of developing a monitoring system that might store their past service records. Instead, they favored motivators for good performance such as payment bonuses (72%) and compensation (85%).

One contractor was concerned about the introduction of any new system for contract bidding because it could mean that "opportunities will not be available for new contractors, which could hurt the government's claim of fair competition in outsourcing." Another contractor, however, stated:

> Competition and a limited contract period have made us assure quality and innovate service delivery approaches that help the government to get the best from us. Since contracts are governed by a definite contractual procedure with proper competitiveness ensured in the bidding process, it also seeks to protect the public against waste of public funds and prevent abuses such as preference and wastefulness.

Several bureaucrats valued contract management because "[c]ontracting out helps shift the responsibility to private providers, holding the other party accountable for the work undertaken" and stated that the "public will be happier as a result of timely and efficient services."

### Compliance with Requirement

While some contractors felt that the pressure from both the public and the government was intense, others believed that such pressure would help sharpen their competitive edge and that winning government contracts would endorse them as "quality service providers," which would in turn help them obtain more business. As for the bureaucrats, they mentioned that outsourcing would offer them wider choices of service providers and better schedule maintenance.

Both parties held roughly balanced views on issues such as expanding contract sizes by bundling, the inclusion of provisions for contract exclusion/renewal and better allocation of risks. More than 60% of these respondents, however, did not consider that longer contract periods or adopting input/output-based service specifications would be helpful.

## Discussion and Concluding Remarks

Our surveys and interviews confirmed that bureaucrats and contractors perceived contract management differently. Three different sets of conceptions were identified (see Table 1). The bureaucrats (Conception 1) perceived that contract management was primarily the management of services or public functions divested by the government. Likewise, the contractors (Conception 2) perceived that contract management was a process of providing services in an ideal context of fair competition. However, both the bureaucrats and contractors (Conception 3) paid more attention to the benefits of managing contracts effectively and well. For example, the bureaucrats (Conception 1) expressed the need to search for and train staff to manage contracts. The contractors (Conception 2), meanwhile, tended to regard themselves as "specialists" in service provision, which also reflects the principle behind the principal-agent relationship. The bureaucrats and contractors (Conception 3) possessed a more comprehensive understanding of contract management, seeing it as a way to achieve efficiency of service delivery in the short-run and sustainability of service provision in the long-run.

The differences between Conceptions 1 and 2 show divergence in their perceptions toward three attributes: "human resources," "information transparency," and "compliance with requirements." For the attribute of "human resources," the bureaucrats emphasized that contract managers should possess the skills and expertise, while the contractors focused on their knowledge of government rules and procedures of delivering service effectively. For the attribute of "information transparency," both of them agreed that comprehensive disclosure of information from the other party was important: the bureaucrats needed information from the contractors to assess their capacity of providing services, while the contractors needed information such as contract details from the bureaucrats to guarantee their financial returns. The bureaucrats taking the views of Conception 3 indicated that they emphasized the accessibility of information relating to contractors' capacities, particularly in terms of their financial situation and their previous service records. As for "compliance with requirements," those taking the views of Conception 1 regarded the bureaucrats as being responsible and accountable for the services delivered to the public. The bureaucrats therefore strongly felt the obligation to monitor progresses of work and ensure that contractors would comply with service requirements. The contractors taking the views of Conception 2, however, were concerned about how they could fulfil government requirements to make sure they would receive any payments due.

**Contract Management: Perspectives of Bureaucrats and Contractors in Hong Kong, Table 1** Conception building results

| Five key attributes of effective contract management | | | | | | |
|---|---|---|---|---|---|---|
| Conceptions | Main focus | Human resources | Communication | Information transparency | Monitoring system | Compliance with requirements |
| **Conception 1:** Bureaucrats' perspective | Achieving divestment of noncore government functions | Training and searching for contract managers with skills and expertise | Establishing an open, efficient two-way communication channel | Accessing the capacity of service providers in the selection of contractors | Implementing monitoring in accordance with the nature of the service and the contract length | Ensuring the outsourced services follow the requirements as the bureaucrats are still held accountable |
| **Conception 2:** Contractors' perspective | Providing outsourced services to government under fair competition | Providing service as specialists with sufficient knowledge of government rules and procedures to deliver service effectively | Updating any contract requirements that help to avoid frequent adjustments in contracts | Providing complete knowledge of contract details that guarantee a better foundation for the negotiation of contract values | Arranging proper frequency of checks that do not affect their provision of services | Obtaining secured returns from the government while providing a financial deposit to secure completion of service |
| **Conception 3:** Values of Contract Management perceived by both bureaucrats and contractors | Efficiency of service delivery in short run; sustainability of service provision in long run | Building up the capacity of commercial expertise in the public sector | Maintaining mutual trusted relationships that generate consensus on accountability | Evaluating outsourcing budgets and plans, risk management, and stability of service provision | Ensuring the effective control of financial budgets | Offering wider choices of service providers, improving schedule maintenance, and generating competition among contractors |

Several dilemmas and tensions were observed because of their diverse views over communication and monitoring system. Speaking of communication, the bureaucrats repeatedly emphasized the importance of maintaining open, efficient two-way communication with the contractors. The contractors believed that the government's rules and regulations tended to protect the bureaucrats' own interests. In some cases, poor communication led to distrust between them. Hence, many contractors commented that government officials often did not contact them directly until there was an apparent contract failure. Monitoring systems presented a similar picture: the bureaucrats believed that monitoring was aimed at ensuring that contractors would meet performance requirements, with criteria varying according to service nature and contract length. The contractors, however, mentioned the inconvenience and negative impacts of irregular performance checks. They believed that this would dampen both their work progress and effective provision of services.

Respondents taking the views of Conception 3 generally recognized the value of interaction on the basis of mutual trust to facilitate them to reach a consensus, realize accountability, and ensure compliance with contract requirements, all of which can facilitate contract completion. Organizations work together on a foundation of trust where there is mutual accountability for achieving the desired outcomes. Through the careful alignment of performance objectives, accountability, and control, the service provider is empowered to pursue improvements. If bureaucrats and contractors can align their goals, this will boost contract performance.

It is intriguing to find that a majority of the bureaucrats rejected the proclaimed benefits traditionally associated with outsourcing, including lower operational costs, enhancing service quality, and reallocating resources so that they can be better utilized. While the government subscribes to the orthodoxy that outsourcing is more efficient and cost-effective (Scott 2010), utilizing an external organization to improve the efficiency and general standards of services provision remains doubtful. Grimshaw et al. (2002) point out that one of the paradoxes of hiring an external organization to improve service efficiency and heighten service standards is that the purchaser of these services must invest additional resources in the specification, monitoring, and assessment of contracted services. Hence, the higher the uncertainty and complexity of the contracting phase, the higher the transaction costs of negotiation, administration, and control of outsourcing (Pérez-López et al. 2013).

To align their diverse expectations, it is essential for service contracts to be specific. Among the five attributes of contract management, information transparency, monitoring system, and compliance with requirements are the prevailing features that must be developed in order to enhance performance. Agency theory reflects the self-serving behavior of the controllers and owners of resources. By that theory, if resource controllers outsource to maximize utilization of resources, and if providers try to maximize their profits by producing the specified services at the lowest cost possible, all parties should benefit. In the reality, however, contractors may economize on quality. Likewise, purchasers who seek to save their resources may be tempted to accept the lowest bid and sacrifice service quality. It is therefore essential that contracts or service-level agreements specify clearly both expectations and standards, as well as any monitoring and dispute resolution procedures. Relational contracting may help lower costs because the complex nature of public services requires careful maintenance of an ongoing relationship with private providers (Sclar 2000). Besides, planning a business strategy at the development phase could help generate consensus among administrators and contractors. Furthermore, clear business strategies will help cultivate development of a clear list of requirements for evaluating contractors' potential capacities.

# Contract Monitoring

Lachezar G. Anguelov
The Evergreen State College, Olympia, WA, USA

## Synonyms

Alternative service delivery; Contract management; Contract oversight; Proxy monitoring; Third-party governance

## Definition

Contract monitoring refers to the oversight tasks and functions performed during the delivery of a local government service that has been outsourced and is provided by vendors.

## Introduction

Research on the outsourcing of government services focuses on the "make or buy" decisions faced by public managers, the vendor selection process, and to a lesser extent on the oversight strategies used to assure contract performance. New Public Management (NPM) initiatives became increasingly popular at the end of the last century and suggested that borrowing private sector management strategies could improve the performance of public agencies. A key strategy was to increase the reliance on competitive markets in order to lower the cost of publicly funded services and to improve service quality. Yet, to this day these promises may not have materialized, regardless of the initiatives' wide adoption across the globe (Alonso et al. 2017).

The purpose of this entry is to provide a concise overview of what is known about the monitoring choices made by public managers when it comes to contracted out service production. It begins with a discussion of theoretical perspectives that inform the "make or buy" decision faced by public agencies and the central role played by public choice and property rights theories. Subsequently, contract management is outlined as an important public management function. The entry then turns to an overview of the importance of contract monitoring and how transaction cost theory brings attention to roles played by uncertainty and information asymmetry in contractual arrangements. Finally, it concludes with an overview of how transaction cost theorizing can be aided by incorporating real options theory (ROT) logic when explaining a dynamic contract monitoring environment that emphasizes a desire for cooperation as a preferred approach over competition.

## Outsourcing Public Services

The outsourcing of government services is hardly novel. In fact, some governments have been contracting out service production or procuring items from private markets throughout their entire existence and arguably since their inception (Cooper 2003). These practices grained almost universal popularity across the globe under the New Public Management (NPM) initiatives starting in the 1980s as public agencies began adopting management ideas and practices from the private sector. The outsourcing of public services became particularly popular with some policy makers as it promised lower costs and higher-quality services.

The justification for these normative expectations can be found in public choice and property rights theories. On the one hand, it can be expected that governments might be inefficient because both bureaucrats and politicians (elected officials) could be using service provision to satisfy their own purposes rather than the public's (Savas 1999). To remedy this, the outsourcing of public services could be trusted to the markets where competition and market discipline could assure improved cost-effectiveness and high service quality (Osborne and Gaebler 1993). At the same time, it can be expected that in their pursuit of profits, private sector firms strive to reduce costs (Alchian and Demsetz 1972; Hart and Moore 1990). As a result, the practice of contracting out found popularity and acceptance with some decision-makers as an appealing alternative for delivering publicly funded services. As more public agencies increase their reliance on alternative service production, such as outsourcing, the management of contracts becomes increasingly important for public managers (Brudney et al. 2005; Romzek and Johnston 2005).

## The Need for Contract Management

Since public employees and managers in various agencies increasingly became more reliant on contracting out to deliver services, the importance of contract management capacity became evident. An argument can be made that in some instances government workers found themselves managing contracts more so than delivering services (Prager 2008). Nonetheless writing contracts and assuring vendors are meeting the specified terms can be rather costly itself. In some cases, these expenses can amount to as much as 25% of the total cost of contracts (Rehfuss 1989).

The contracting out of public services is a multistep process (Brown and Potoski 2003; Yang et al. 2009). It begins with weighing the decision of producing a service in-house versus outsourcing (the common in the literature "make or buy dilemma"). Subsequently if it is decided that a service can be produced more effectively by a vendor, public managers need to solicit bids, evaluate them, and award the contract. After the selection of a vendor, managers would have to write the contract, and implementation follows. Needless to say, monitoring of vendors performance and evaluating their compliance with the specified terms on continuous basis is also important and necessary. The contracting process then concludes with auditing and post-contract assessment. Throughout this entire process, public

managers have to dedicate some effort or resources to assure its success.

The bulk of emerging scholarship addressing the outsourcing of public services had primarily focused on the "make or buy" decision. In other words, researchers prioritized understanding why agencies outsource the delivery of services and which services should be contracted out. Another important research stream focused on what determines the type vendor to be used for the outsourced services. In particular, studies examined when is it more appropriate to enter into interlocal agreements with neighboring jurisdictions, when should nonprofit organizations be relied upon, and when should for-profit vendors be used. Until recently, much less attention has been paid to the importance of contract monitoring – arguably an essential contract management function.

It can be reasoned that monitoring costs on average can be expected to be low for contracted out services. After all, competitive marketplace discipline and its incentives structures are some of the reasons why external production is thought to be more cost-effective. In reality, competitive markets for public services have not materialized in many cases (Girth et al. 2012). In addition, transaction costs economics (TCE) theory posits that competition may not be sufficient for cost savings if costs expanded throughout the contracting process depicted above outweigh the potential benefits or savings (Williamson 1981).

Lack of competitive markets for services presents public managers with certain challenges. In the absence of competition, increased monitoring costs are likely in cases where vendors exhibit opportunistic behavior. In other words, efforts expanded on management and oversight of contracts and service suppliers can negatively impact any potential government savings that are expected to result from outsourcing service delivery (Hefetz and Warner 2012).

## The Importance of Contract Monitoring

Contract monitoring is important for successful outsourcing of public services (Girth 2014; Marvel and Marvel 2009; Hefetz and Warner 2004). Research findings show that difficulties with monitoring can impact a range of contracting outcomes and can potentially lead to reverse contracting (Hefetz and Warner 2004). This seems to be the case because writing as well enforcing contracts is costly (Levin and Tadelis 2010; Yang et al. 2009). Monitoring costs can therefore impact overall "make or buy" decisions, but they can also explain high government expenditures for outsourced public services.

Governments' contracting out decisions are based on estimated costs of producing the service directly on the one hand versus the combined costs of contracting and monitoring vendor performance on the other. Inadequate monitoring and control can lead to lower savings (Sclar 2001). Yet providing sufficient monitoring may be an expensive endeavor. Presumably monitoring is important for successful public service outsourcing. Managers can use formal and informal monitoring tools and can be constrained by their organizations' capacity and environmental pressures (Van Slyke 2007). Therefore, public managers use a variety of oversight tasks and methods in their efforts to monitor performance throughout the service delivery process. Needless to say, this plethora of oversight methods represents varying costs and thus can have very different overall impact on expenditures for contracted out public services.

## The What and How of Contract Monitoring

It is important to address in greater detail the "what" and "how" of contract monitoring. These inquiries are important for both the theory and practice concerned with successful alternative services delivery that relies on outsourcing strategies. In the previous section, the importance of contract monitoring was outlined particularly as it applies to the public administration literature. Contract monitoring is considered the evaluative capacity of contract management or the use of staff and resources to collect performance information (Brown and Potoski 2003). Contract

monitoring capacity has been defined and studied in many different ways. Some scholars operationalize it in a broad way to include a range of functions, whereas others focus on a small indexes, yet other theorists view it as any source of information used by a government agency to monitor vendor resources and activities (Lambright 2008; Warner and Hefetz 2012; Van Slyke 2007; Marvel and Marvel 2007).

In essence there are two important aspects to the study of contract monitoring. The first is the "what" – what does contract monitoring itself consist of. As noted above, the literature reflects a range of operational definitions and measurements. Some are all encompassing and general, whereas others list as many as ten specific functions spanning the entire contracting process. Marvel and Marvel's (2007) classification, for example, accounts for oversight in three different categories: upfront monitoring, process monitoring, and ex post monitoring. This conceptualization suggests that public managers should make sure monitoring is exercised when setting service work plans as well as when setting performance targets (upfront monitoring). Monitoring is also necessary throughout the length of the delivery of the services. This entails ongoing assessment of compliance with work plans, as well as compliance with rules and regulations. At the same time, financial audits must be completed, and it must be verified that services are provided as specified by the contract; the results of services should be measured. Needless to say, it is also important to monitor client complaints and to measure their satisfaction with service delivery. Do all public agencies perform these oversight tasks all the time? Frankly no. Though as indicated above contract monitoring is important. And public managers can strategically decide how to proceed in order to assure the successful outsourcing of public services.

The second important aspect is the "how" of contract monitoring. How can public managers make sure that there is sufficient oversight for their outsourced services? Especially when this can require substantial resources and negate any potential savings promised by contracting out with private sector vendors. Arguably performing all of the monitoring tasks outlined by Marvel and Marvel (2007) directly could be very costly for public agencies. Governments can technically conduct monitoring either directly or through proxy (Amirkhanyan 2009; Brown and Potoski 2006). Direct contract monitoring means that public agencies are expanding their own resources to make sure vendors are complying with the terms of contracts. Monitoring by proxy on the other hand allows governments to enlist the help of third-party evaluators to verify that vendors are performing as specified in the contract (Yang and VanLandingham 2011). An alternative proxy monitoring approach is to trust the vendors' self-reported performance. And last but not least, public managers can rely on service recipients to sound the alarm when it comes to service quality.

Needless to say, direct government monitoring appears to be costliest approach to contract oversight. Though proxy monitoring might be more economical, it comes with certain risks – public managers do not have direct control and would have to rely on information supplied by other parties. It also appears that monitoring by proxy might be popular with public managers. For example, while studying the prevalence of collaborative monitoring, Amirkhanyan (2009) shows that in some cases self-reporting by vendors accounts for most of the contract monitoring! Similarly, her study shows that in as many as half (54%) of the contracts under examination, a third-party monitor was used!

How should public managers decide whether to conduct contract monitoring directly or rely on third-party (proxy) monitoring? Agency and transaction cost theories posit that vendors could engage in opportunistic behavior which necessitates investment in contract monitoring capacity. A limitation of relying solely on these theoretical frameworks to determine the appropriate oversight strategy is their reliance on a static environment. In reality contracting is a rather dynamic process. Services are contracted out, can be brought back in-house, contracted out again, and so on. The monitoring strategies can also be dynamic and evolve overtime.

A framework that could also be used to contribute to our understanding of contract oversight is real options theory (ROT). Its theoretical

arguments present a complementary approach to contracting structures and potentially can help elucidate and guide monitoring decisions faced by managers. Schepker et al. (2014) explain how ROT can contribute to the public services contracting literature in three ways. Firstly, its theoretical premise highlights the need for flexibility particularly in situations characterized by uncertainty. Secondly, the theory explicitly suggests that contractual governance should be modified when needed in order to respond to changing environmental factors and availability of novel information. And thirdly, ROT can be complementary to the transaction costs theoretical approaches currently dominating the public services contracting literature.

Though most empirical studies on public services contracting examine static data, few researchers would argue that the outsourcing decisions are dynamic. In essence, some contractual arrangements could be decades long with provisions modified in specified time increments. This potential for repeated interaction and relationship continuation often leads to increased cooperation and trust. Revisiting the procurement arrangements also allows contracting parties (governments and vendors) to restructure their agreements in efforts to improve outcomes and processes. This can arguably explain why scholars are finding evidence that relationships are of particular importance when it comes to government contracting (Brunjes 2019).

## Conclusion

This entry has provided an overview of what is known about a key contract management function for outsourced public services. Contract monitoring has been depicted as an essential task for public managers. The entry began with a discussion of theoretical perspectives on public services contracting, namely, how competitive markets are expected to aid in the delivery of lower cost and higher-quality services. Public choice and property rights theories in particular articulate how competition and firms' desire to lower production costs can aid governments in providing services in a more cost-effective manner. Though government outsourcing has been on the rise, the expected cost savings have either not materialized or scholars have not been able to adequately illustrate their prevalence. An argument is made here that contract monitoring, itself a costly endeavor, combined with lack of competition could be a potential explanation.

After outlining why contract monitoring is important for theory and practice when it comes to outsourcing government services, this entry also discussed the "what" and "how" aspects of contract oversight. In the "what" sections, the functions and tasks that span the public service contracting process were outlined. In the paragraphs that discussed the "how" questions, this entry highlights the prominent role of transaction cost theory in explaining public managers' decisions. Subsequently, an argument is made that real options theory could also help in explaining the empirical findings that demonstrate the prevalence and desire for relationships rather than the effectiveness of competitive markets when it comes to successful government contracting.

## Contracting with Government

Jiahuan Lu
School of Public Affairs and Administration, Rutgers University-Newark, Newark, NJ, USA

## Synonyms

Contracting out; Government contracting; Purchase-of-service contracting

## Definition

Government-nonprofit contracting: a contractual agreement between a government agency and a nonprofit organization to deliver a government-funded service to an eligible group of clients.

## Introduction

A remarkable feature of the contemporary nonprofit-government relationship is the increasing government-funded nonprofit activities. Government funding reaches the nonprofit sector in various ways, through such financial mechanisms as contracts, grants, and vouchers. Accordingly, government funding becomes a critical funding source for most nonprofit organizations. To the entire nonprofit sector, government funding generally constitutes over one third of the sector's total revenue (McKeever and Pettijohn 2014). This number could be even higher in service delivery nonprofit organizations, where government funding sometimes represents almost half of their total revenue income (Lu 2015).

Admittedly, the nonprofit sector includes a diverse set of organizations, ranging from social service organizations with service delivery as their major organizational activities to advocacy organizations with political participation as their major focus. This entry focuses on service delivery nonprofit organizations, that is, charitable organizations operating under 501 (c) (3) tax code, and examines government-nonprofit service contracting in these nonprofit organizations. Service contracting is defined in a broad way, involving public services funded by government agencies through contracts and grants but delivered to clients by nonprofit organizations. Indeed, this kind of contractual relationship between government and nonprofit organizations has a long history, with its historical root dated back to the colonial time, but the substantial growth in government-nonprofit contracting didn't appear until 1960s (Smith and Lipsky 1993). This entry will address four questions: (1) What is the rational of government-nonprofit contracting? (2) What is the scope of government-nonprofit contracting? (3) What factors could predict nonprofit receipt of government contracts and grants? (4) How does government contracting influence nonprofit operations?

## Rational of Government-Nonprofit Contracting

When government decides to contract out service delivery, there are several factors that lead nonprofit organizations to be appropriate contractors to work with. First, many service delivery nonprofit organizations are community-based organizations. Their embeddedness in local communities enables these nonprofit organizations to directly interact with citizens and thus better understand and respond to local needs. When government relies on these local organizations to deliver various services, nonprofit contractors could expand public service coverage to remote communities which government agencies could not reach and further tailor service provision to meet diverse client needs. Moreover, their locations in local communities also allow nonprofit contractors to examine the real effect of government programs and provide policy suggestions for funding agencies to modify existing policies and programs. In sum, nonprofit organizations' information advantage because of their unique locations allows them to act as an appropriate contractor.

Second, nonprofit organizations are mission-based organizations, with social improvement as their organizational goal. In this way, nonprofit contractors are expected to provide government-funded services to serve needy clients to advance social benefits, rather than focusing on cost minimization and using government funding to maximize organizational revenue. Again, largely because of the nondistribution limitation, nonprofit organizations are not legally allowed to distribute profits to their stakeholders. As such, nonprofit organizations are believed to have weaker incentives to take advantage of information asymmetry to increase profits through cutting costs and creaming, when compared with for-profit organizations. This is particularly an

advantage in service provision where service providers always enjoy a high level of discretion throughout service delivery process, and funding agencies often fail to fully regulate and monitor contractor behaviors. In sum, nonprofit organizations' social mission and nondistribution constraint make themselves more trustworthy than for-profit organizations.

In addition, there are also good reasons why nonprofit organizations are willing to receive government funding and become government contractors. First, most nonprofit organizations are small- or mid-sized organizations, operating with limited budgets. Therefore, nonprofit organizations are always struggling for reliable revenue sources. Compared with other revenue sources, government funding is relatively stable, which makes it a predictable funding source for nonprofit organizations. In this way, acting as government contractors and relying on government funding could help nonprofit organizations stabilize their resource environment and ease potential funding fluctuations, leaving them more capacity to pursue social causes. Second, government funding could help enhance the legitimacy of recipient organizations. In order to receive government funding, nonprofit contractors have to go through competitive merit-based selection processes, with extensive review and monitoring. In this way, government funding serves as an endorsement of quality and reliability. Nonprofit contractors could further use the receipt of government funding as an indicator of trustworthiness and competence to solicit resources from other venues (Lu 2016). In sum, government funding could enhance nonprofit contractors' capacity, which further allows them to draw resources from other revenue sources.

Overall, the contractual relationship between government and nonprofit organizations seems mutually beneficial to both parties (Saidel 1991). Government agencies prefer nonprofit contractors because of their proximity to citizens and perceived trustworthiness. Nonprofit organizations prefer government funding because of its stability and credibility. Therefore, this mutual beneficial relationship leads to a mutual dependence in the landscape of service delivery. This institutional arrangement is termed by Salamon (1981) as "third-party government" and by Smith and Lipsky (1993) as "contracting regime."

## Scope of Government-Nonprofit Contracting

This government-nonprofit contracting has been a central feature of service delivery system in various countries all over the world. In the United States, for example, the contractual relationship between government and nonprofit organizations in service delivery has existed for decades, with its historical root traced back to the colonial time. However, the substantial increase in government financing of nonprofit activities did not appear until the 1960s and 1970s when government decided to enhance its role in various social programs. Since then, there has been a sharp increase in the scope of government-nonprofit contracting (Smith and Lipsky 1993). At this moment, although the extensive use of government-nonprofit contracting in service delivery has been widely acknowledged, the exact magnitude of the contractual relationship across the nation is still largely unmeasurable. However, several recent survey data help us gain some sense about the overall picture of the scope of the US government-nonprofit contracting. For example, at state level, Gazley and Brudney (2007) surveyed local government administrators and nonprofit organizations in Georgia in 2003–2004 to explore government-nonprofit collaboration in public service delivery including contracts and grants. They found that over 50% of local administrators reported collaboration with at least one nonprofit organization and that about 50% of nonprofits reported partnership with local governments. Again, Lu (2015) surveyed human service nonprofit organizations in Maryland in 2012. He found that 77% of survey participants reported their receipt of government contracts and grants and that government funding on average constituted 44% of those organizations' total revenue.

A more comprehensive examination of government-nonprofit contracting in service delivery comes from a national survey of human service nonprofit organizations conducted by the Urban Institute (Boris et al. 2010). The research team surveyed a national sample of about 3500

human service nonprofit organizations from all 50 states and the District of Columbia in 2009. Based on the survey data, they estimated that government agencies at all levels have about 200,000 contracts and grants with about 33,000 human service nonprofit organizations across the country, equivalent to a monetary amount of over $100 billion. This finding implies that for every human service nonprofit organization in the nation, it would have six contracts and grants on average. Further, for organizations with government contracts and grants, government funding accounts for 65% of their total revenue income.

In sum, the complete picture of government-nonprofit contracting is still largely ambiguous, and the survey results from several recent studies are not exactly the same. However, two things seem pretty clear. First, government-nonprofit contracting is being widely used by government agencies at all levels as a tool in the provision of various services to achieve desired policy goals. Second, given the massive government contracts and grants in nonprofit organizations, the importance of government funding to the nonprofit sector is irreplaceable. For most individual nonprofit organizations, government funding is at least one of the crucial funding sources, if not the only one.

## Factors Predicting Nonprofit Receipt of Government Funding

Given the critical importance of government funding to most nonprofit organizations, an interesting question is to explore the factors that would be associated with nonprofit receipt of government contracts and grants. The answers to this question have meaningful practical implications for nonprofit leaders to manage organizational operations and develop effective financial strategies. Indeed, although the current understanding on the determinants of nonprofit receipt of government contracts and grants is still developing, existing research has already been able to provide helpful insights (Garrow 2011; Lu 2015; Stone et al. 2001; Suárez 2011).

It is useful to consider government-nonprofit contractual relationship as a kind of interorganizational relationship, which involves two dimensions: structural and relational (Faems et al. 2008). The structural dimension focuses on how visible formal components within two organizations affect interorganizational behaviors, while the relational dimension emphasizes the role of invisible informal interaction between two organizations in shaping interorganizational activities. In this line of reasoning, the factors that might predict nonprofit receipt of government contracts and grants could be summarized into these two categories. It should be noted that these two categories of factors are not mutually exclusive but complementary.

Structural factors emphasize that structural compatibility between government and nonprofit organizations could facilitate information exchange and flow between the two actors and thus promotes government-nonprofit partnership. In this way, at least four factors would help facilitate nonprofit receipt of government funding: formalization, professionalization, organizational size, and organizational age.

Formalization refers to the extent to which an organization is equipped with formal components in its operations. Formal arrangements in an organization can include a complete set of rules, regulations, and standard operating procedures, a clear chain of command, formal job descriptions for each staff position, and formal performance evaluations for staff and programs. Nonprofit organizations with more formal components are more used to government bureaucratic system, which increases the chance of collaboration. Also, organizational behaviors in formalized nonprofit organizations are more predictable and credible, which leads funding agencies to believe that these nonprofit organizations are able to take on more responsibility in the delivery of government-funded services.

Professionalization refers to the extent to which an organization employs a professional workforce and expertise in organizational management and service jurisdictions. Example indicators of professionalization are whether an organization is staffed by paid personnel, is managed by an executive director, only uses paid personnel in service delivery, and has a full-time executive director position. Nonprofit

organizations with these professional components are more likely to receive government funding not only because these components reflect reliable occupational norms and standards but also because these components allow nonprofit organizations to better meet the government requirements in grant and contract writing, performance reporting, and financial auditing. All these compatibilities enable nonprofit organizations to work more closely with funding agencies and provide public-funded services.

In a similar vein, organizational size and age could predict nonprofit receipt government funding in that bigger and older organizations generally embrace more organizational capacity in financial, human, and technological resources. This abundantness in resources allows nonprofit organizations to take on more responsibility to address social problems and to be considered more reliable and predictable.

In sum, from a structural perspective, more established nonprofit organizations would have more compatible structures with funding agencies and thus are more likely to receive government contracts and grants. This argument leads to several propositions as follows:

- Proposition 1: Nonprofit organizations with more established structures are more likely to receive government funding.
- Proposition 1a: More formalized nonprofit organizations would receive more government funding.
- Proposition 1b: More professionalized nonprofit organizations would receive more government funding.
- Proposition 1c: Bigger nonprofit organizations would receive more government funding.
- Proposition 1d: Older nonprofit organizations would receive more government funding.

On the other hand, relational factors emphasize that informal relationship building and trust cultivation in interorganizational relationship could foster mutual trust between government and nonprofit organizations and thus would facilitate nonprofit receipt of government funding. In this line of reasoning, four factors fall into this category: co-optation, advocacy, history of government funding, and collaboration.

First, nonprofit organizations with connections with government agencies enable to develop interorganizational relationships, which would facilitate the rise of government-nonprofit funding relationship. For nonprofit organizations, two usual strategies to get connected with government agencies are co-optation and advocacy. Co-optation refers to the process of absorbing important elements from external environment such as powerful people with legitimate status (e.g., political leaders and high-ranking government officials) to nonprofit leadership. In this way, nonprofit organizations legitimize themselves and get access to funding agencies to achieve favorable position in government funding process. In addition, advocacy refers to the process of engaging with government agencies to influence public policy and government practice. Through participating in advocacy, nonprofit organizations build connections with policy makers and further shape policy environment that promises favorable programmatic administration and outcomes.

Second, trust constitutes a critical factor in informal interactions. Trust helps reduce uncertainty and complexity in collective actions, which could stabilize interorganizational collaboration. However, trust is only formed incrementally and enhanced through repeated interactions. In this way, a history of interorganizational interaction and cooperation becomes another determinant of government-nonprofit contracting. Indeed, government-nonprofit contracting is a path-dependent process. Nonprofits receiving government funding in previous years or involved in collaborations with government other than service contracting might have formed various trust mechanisms with funding agencies. These mechanisms could coordinate and safeguard exchange and thus promote the continuity of the funding relationships.

In sum, from a relational perspective, more interactions between nonprofit organizations and government would develop stronger mutual trust relationship, which could further result in more government-nonprofit contracting. This argument leads to the following propositions:

- Proposition 2: Nonprofit organizations with more connections and trust with government agencies are more likely to receive government funding.
- Proposition 2a: Nonprofit organizations engaging in co-optation would receive more government funding.
- Proposition 2b: Nonprofit organizations engaging in advocacy would receive more government funding.
- Proposition 2c: Nonprofit organizations having a longer funding history with government would receive more government funding.
- Proposition 2d: Nonprofit organizations having more collaborations with the government other than service contracting would receive more government funding.

## Challenges of the Government Contracting on Nonprofit Operations

It is becoming increasingly clear to many that accepting government funding and acting as government contractors is not cost free. Government funding would bring a series of changes, both desired and undesired, to nonprofit operations, which further influence the roles nonprofit organizations play in democratic governance. Broadly speaking, service delivery nonprofit organizations play two major functions: service provision and policy advocacy. On the one hand, as service providers, nonprofit organizations serve the vulnerable populations and moderate social problems by delivering various direct services to needy citizens to meet their diverse welfare needs. On the other hand, as social change agents, nonprofit organizations advance their mission by engaging with government agencies to shape the policies that address those social problems. Government contracting has impacts on nonprofit operations in these two areas.

On the service delivery side, government funding would bring a number of changes. First, government funding would make nonprofit operations increasingly formalized and professionalized. To apply for government funding, nonprofit organizations have to spend substantial amount of time in writing contract and grant proposals and negotiating with funding agencies. While delivering government-funded services, nonprofit organizations have to suffer from extensive government oversight and monitoring. As such, nonprofit managers have to work with funding agencies on administrative reporting, performance evaluation, and financial auditing. All these changes might lead to nonprofit organizations' greater formalization and administrative inefficiency.

Second, to secure government contracts and grants, nonprofit organizations sometimes have to compete with for-profit organizations for funding purposes (Frumkin and Andre-Clark 2000). Traditionally, nonprofit organizations are major actors in social and human service markets. However, in recent decades, for-profit organizations have demonstrated growing interest in entering service markets and acting as government contractors and grantees. Although nonprofit organizations have comparative advantage in their proximity to citizens and perceived trustworthiness, in most cases for-profit organizations enjoy comparative advantage in their operating efficiency, due to their profit motive and access to more resources. Therefore, to compete for government funding, nonprofit organizations sometimes have to engage in efficiency competition with for-profit organizations and become more and more businesslike. In this way, the sectoral boundary in organizational operations between nonprofit and for-profit organizations tends to be blurred.

In addition to service delivery, charitable organizations also engage in policy advocacy.

Although providing high-quality services constitutes their organizational priority and some types of advocacy such as lobbying are under strict legal regulations, many service delivery nonprofits still participate in various other advocacy activities such as testifying before legislative committees and joining government advisory committees to shape public policy (Bass et al. 2007). On this policy advocacy side, government funding might crowd out nonprofit organizations' participation in advocacy activities and change the nature of their advocacy efforts. First, government-funded nonprofits would not want to challenge their funders to bite the hands that feed them, which may ultimately undermine the funding relationship. Nonprofit organizations thus are generally concerned that they would be punished by the government if they challenge existing or proposed policy (Bass et al. 2007). Second, the changes in nonprofit operations resulted from government funding would indirectly crowd out nonprofit attention to advocacy. As mentioned above, government funding is always associated with the pressures to become more businesslike, formal, and professional. Operating under these pressures, nonprofit organizations become more focused on service delivery, with limited attention to their historical role as policy advocators. Third, even if nonprofit organizations still decides to be politically active, they have to be very careful with their advocacy efforts, not to pursue wide policy change but only to maintain their funding stream (Mosley 2012). In this way, government funding might undermine nonprofit organizations' civic and political role.

In sum, receiving government support is not cost free. Although government funding brings stability and credibility to recipient organizations, it does modify nonprofit operations and undermine the political function. Nonprofit contracting with government agencies in practice is more complicated than the one in theory. For nonprofit organizations, to receive government support, they have to simultaneously accept the side effects associated with government funding, both desired and undesired. In viewing the downside of government funding, a common practice that many nonprofit organizations follow is to seek resources from private sources such as private donations and commercial activities to diversify their revenue sources, rather than fully relying on government funding (Froelich 1999).

## Conclusion

In recent decades, government contracting with nonprofits for the delivery of public services and achievement of policy priorities has risen sharply. Although there is a variation in the exact amount of government grants and contracts obtained by individual nonprofit organizations, the importance of government funding to the entire nonprofit sector could not be underestimated. This entry aims to delineate the rationale and scope of government-nonprofit service contracting, using the United States as a case. Further, the entry attempts to dig deeper into this contractual relationship and explores the factors that predict nonprofit receipt of government funding and the changes that government funding brings to nonprofit operations. Although the discussion here could not exhaust every aspect of government-nonprofit service contracting, it does provide an overview of the picture.

In addition, although the discussion here mostly focuses on the US context, the third-party government or contracting regime arrangement seems prevalent across many other countries. In particular, government financing of nonprofit activities is widespread through European countries. In countries such as the Netherlands, Germany, France, and Belgium, government support generally represents more than half of all nonprofit income (Salamon 2006). In this way, the arguments made above could be applied to nonprofit organizations in these countries as well.

## Definition

The counter-effects of imposing penalty clauses in information technology outsourcing agreements.

## Introduction

Outsourcing the technological infrastructure has become a common practice for public administrations worldwide aiming at dedicating efforts and resources on their core activities. Outsourcing agreements have been conceptualized through the lens of agency theory by many governance applications of Principal-Agent models, some of which includes government contracting, asset and fund management, supply chain, cross-country offshoring, informal contracting, and information technology products and services (Coats 2002; de Almeida 2007; Dluhosch and Hens 2016; Dey et al. 2010).

The distinctions and influences of extrinsic incentives from contractual sanctions and rewards have been widely discussed in the economics, governance, and information systems management studies (Starbird 2001). Penalty clauses are intended to disincentive delays and improve the quality toward the objectives of the Principal. *Contractual misincentives* represent strategies once designed to work as an incentive (or disincentive) but have an opposite effect. This situation has been called sometimes as the crowding-out effect by Frey and Jegen (2001) or over-justification effect by the psychological theory of self-perception (Deci 1971), implying that motivations may undermine when a nonmonetary interaction becomes an explicitly monetary one (Titmuss 1970).

The phenomena has been evidenced in some interesting discussions about the political behavior of voters in compulsory elections (Nepomuceno and Costa 2019a), in the deliberate tardiness by parents to pick their children from day-care centers (Gneezy and Rustichini 2000) and in the propensity for blood donations (Glynn et al. 2006). In the first work, according to the authors, the imposition of low-cost fines for the abstention in the compulsory Brazilian elections is one of the main motivators (misincentive) for the decreasing turnout in recent national elections. In the second, the imposition of monetary sanctions by day-care administrations in Israel aiming at reducing the delay of parents resulted in the misincentive of increasing tardiness. In the last instance, blood donations presented a considerable drop after the inclusion of financial compensations by changing the intrinsic self-personality philanthropy benefits.

Game theory and optimization procedures are strong tools to support decision-making in the design of outsourcing contracts and negotiations under the most common context of asymmetry in information. The current study departs from this problem in the design of bilateral contracts for public administrations, particularly considering information technology outsourcing. Contractual misincentives are formulated as a Principal-Agent problem considering a sequential game of incomplete and asymmetric information about the cost structure of the client and the productivity of the vendor. The sequential game is characterized by the imperfect information from the client concerning the vendor, where the imposition of a fine uncovers information about the client's cost structure resulting in delays, similar to many formulations of this nature (Coats 2002; Dey et al. 2010; Nepomuceno et al. 2018). The next sections are dedicated to present the fundamental concepts of this approach with a numerical example. The conclusion summarizes the main prospects of the developed contribution.

## Incomplete Information Scenario

An appropriate model to support outsource contract designs considers several variables in the ITO relationship. According to the conventional software engineering literature (Boehm et al. 2000), those variables must represent the vendor's cost structure and the client's utility as a function of the quality of the software system, its delivery date, and the effort (in terms of capital and labor) a vendor chooses to apply to the project (Nepomuceno and Costa 2014). Each of the variables considered in the ITO scenario regarding vendors (Agents) and clients (Principals) is described as follows.

### The Agent

The Agent (software vendor) utility function is composed by the delivery time choice $T$ as a function of the current payment for the information technology product or service $G$ and the expect payment from future contracts $[(P)G_f + (1 - P)G_f]$. The software vendor faces two types of costs, one related to the quality of the product $Q$, i.e., the predefined requirements for the technology, and one related to the unproductivity of their capital and labor $LK$. The utility of the Agent $U_a$ by a choice of $T$ is maximized in the expression:

$$max\ U_{a(T)} = G + \left[(P)G_f + (1-P)G_f\right] + T - \left(C_f + \frac{Q^b LK}{T(P)}\right) \quad (1)$$

where:

$P$ and $(1 - P)$ are the probabilities the client is high or low cost, respectively.

$Q$ represents the quality requirement for the product or service.

$G$ is the current payment for the outsourcing transaction.

$T$ is the difference between the effective date on which the vendor delivers the product $T2$ (decision variable) and the date in the agreement, so that a positive $T$ means that the Agent delays the delivery (adds some utility by slacking efforts) and negative $T$ means that the Agent anticipates the delivery (loses utility by applying more efforts).

$L$ is the constant which captures the developer's lack of experience, skills, or immaturity of the development team (the unproductivity of the labor).

$K$ is the constant which represents the inadequacy of the software tools or the nonexistence of reusable code (the unproductivity of the capital).

$b$ is the exponent for the nonlinear relationship (as described by the side effects of development code), and it is usually estimated with a value between 1 and 1.5 (Boehm et al. 2000).

$G$ represents the *participation constraint* in order to get the vendor to accept the outsourcing agreement, i.e., the client must offer at least $G \geq (C_f + C_v)$ despite expected gains from future payments (contracts). Other concepts which affect the Agent's effort are the developer's experience or ability and the maturity level of the development team (represented by the constant $L$). Silva and Costa (2013) argues that, in order to optimize the time associated to complete a software development project, it is necessary to identify which professionals should be allocated to each function and task in the development phase, given the set of abilities and expertise. They are treated as one parameter of the employees' productivity so that the cost for the Agent to produce a given piece of software or provide a certain system increases when the team is more incoherent or when it lacks sufficient knowledge or technicians.

The capabilities of the software tools and the possibility of reusable code (represented by the constant $K$) are included as a third concept in the vendor's cost structure function. The absence of previous code which can be used for the new project and the inadequacy of the group's technological tools can considerably increase the time and effort invested, even considering low-quality software (which presumes easier development) or having the most qualified development team for the task. The Agent's variable cost is inversely proportional to the time of delivery: if there is less time to finish the project, more effort in capital (e.g., new tools) and/or labor (e.g., extra hours) is needed. The time variable ($T$) in the model is weighted by the probability that the Principal is a high-cost client. When the probability is high, the project becomes more costly because any delay in delivery can affect the vendor's expected gain in future transactions (e.g., affect the possibility to renew licenses).

The $b$ exponent is sensitive to the novelty and risk of the project, which can also be inferred from other parameters, such as the development team's inability to understand or use existing codes. The sequential game with incomplete or asymmetric information implies that the Agent is also concerned about the reputation and long-term profit, which might result from subsequent outsourcing contracts with the same client. The expected payoff in future transactions is set as a function of the type of the client, which can have high or low cost in relation to the technology. A high-cost client is assumed to have more difficulty working without the outsourced product or service than a low-cost client would. In other words, it is more costly for the high-cost client to conduct the same amount of business without the software system than it is for the low-cost client. For that reason, the high-cost client places more importance on a shorter delivery time (with no delays) and on high-quality software than the low-cost client. The parameter $u$ represents such client evaluations in the following description of the Principal.

### The Principal

The Principal (outsourcer client) welfare is based on the software quality. In general, the quality is

determined by the requirements and specifications in the agreement such as the interface, features, capabilities, and visualization tools such as graphics, plots, maps, dashboards, charts, scatterplots, and other forms of interactive visualizations, which can enable users to capture, treat, mine, and manipulate data and design and implement decisions (Nepomuceno and Costa 2019b). The customer welfare function decreases with the potential delay in the product delivery by the vendor and decreases with the current payment in the agreement. Thereby, the client aims at maximizing utility by the choice of $Q$, represented by the following function:

$$max\ U_{pr(Q)} = u_1\left(Q + Q_f\right) - u_2T - G - \left[(p)G_f + (1-p)G_f\right] \quad (2)$$

where:

$p$ and $(1 - p)$ are the probabilities that the vendor has low or high productivity (delaying or not delaying the delivery), respectively.

$Q_f$ represents the desired payoff from the quality requirement of future products or service.

The constants $u_1$ and $u_2$ represent the client's sensitivity to the quality and time.

It is assumed the vendor is willing to accept the agreement when the gains (in utility) are equal to the opportunity cost $(U_{a(T)} - (C_f + C_v))$, in which case the decision will be made on the basis of future earnings and delivery time contributions. So the *incentive compatibility constraint* to eliciting the high-quality software in our model is a function of probabilities that the vendor has low or high productivity, their expected gain and cost, so that $G + (G_f) - (C_f + C_v) > (1 - p)^*(C_f + C_v)$. Because the gains (in utility) might equal the opportunity cost, $G = 0$, and to elicit a high-productivity vendor ($p = 0$), $G_f > (1 - 0)^*(C_f + C_v) - (C_f + C_v)$, or $G_f > 0$, i.e., the client must guarantee some future gain to get a high-quality software from a high-productivity vendor.

The parameters $u_1$ and $u_2$ (when multiplied by the respective quality and time) represent the utility which the client gains or loses from the software; this value is greater than one when there is a high-cost client (i.e., when the client's valuation is greater than the vendor's) and less than or equal to one when there is a low-cost client (i.e., when the client's valuation is less than or approximately equal to the vendor's). A big $u_1$ for a high $Q$ (or a small $u_1$ for a low $Q$) tells us that the client cares very much about the product's specifications and quality, which causes the vendor to assume the client is a high-cost type. A small $u_1$ for a high $Q$ (or a big $u_1$ for a low $Q$) implies that the client is a low-cost type. The parameter $Q_f$ is the expected gain the client might have from future outsourcing contracts, and it increases with the current performance of the vendor; $u_2$ measures the sensitivity of the client to project delays – with the same interpretation from the $u_1$ coefficient described above. Positive $T$: $(-(u_2T) < 0)$ means that the client receives a late-delivery product (loses some utility by postponing the usage of the technology), and negative $T$: $(-u_2(-T) > 0)$ means that the client has an anticipated delivery (adds utility by applying tools or services earlier).

## Contract Performance

The total social surplus (Dey et al. 2010) is obtained by a combination of the best response from the Principal and the Agent, resulting in the solution for the problem. Summing the utility functions (1) and (2), the problem becomes

$$max\ U_{tot(Q,\ T)} = \left\{G + \mathrm{E}\left(G_f\right) + T - \left(C_f + \frac{Q^bLK}{T(P)}\right)\right\} + u_1\left(Q + Q_f\right) - u_2T - G - \mathrm{E}\left[G_f(LK)\right] \quad (3)$$

Assuming perfectly incomplete information for both parties, there is no reason for the client to believe that the vendor has a higher probability of being highly productive than being less productive. By the same reasoning, there is no space for the vendor's similar belief that the client is a

high-cost one rather than a low-cost one. Thus, $p = P = 0.5$, which simplifies equation (3) to

$$max\ U_{tot(Q,\,T)} = u_1\left(Q + Q_f\right) + T - u_2 T - C_f - \frac{Q^b LK}{0.5T} \quad (4)$$

The first-order conditions (FOC) are

$$\frac{\partial U}{\partial Q} = u_1 - b\frac{Q^{(b-1)}LK}{0.5T} = 0 \Rightarrow Q = \left(\frac{0.5Tu_1}{bLK}\right)^{\frac{1}{(b-1)}} \quad (5)$$

$$\frac{\partial U}{\partial T} = 1 - \left(u_2 + \frac{Q^b LK}{0.5T^2}\right) = 0 \Rightarrow T = \left(\frac{Q^b LK}{0.5 - 0.5u_2}\right)^{\frac{1}{2}} \quad (6)$$

Those are the optimal a priori choices for the Agent and the Principal. Substituting (5) in (6), the best response a posteriori by the Agent to the Principal's optimum choice of quality is

$$T = \left[\frac{LK\left(\frac{0.5Tu_1}{bLK}^{\frac{1}{(b-1)}}\right)^{(b)}}{0.5 - 0.5u_2}\right]\frac{1}{2} \quad (7)$$

A coherent estimate for the $b$ exponent based on current literature is $b = 1.5$ (see section "The Agent"). Then, equation (7) turns to

$$T = \left[\frac{\frac{(0.5Tu_1)^3}{1.5LK^{1.5}}}{0.5 - 0.5u_2}\right]\frac{1}{2} \quad \text{or } T = \left[\frac{(Tu_1)^3}{1.5LK^{1.5} - 1.5LK^{1.5}u_2}\right]\frac{1}{2} \quad (8)$$

Raising both sides of equation (8) to the second power and dividing both sides by $T2$, we have

$$T = \frac{1.5LK^{1.5} - 1.5LK^{1.5}u_2}{{u_1}^3} \quad (9)$$

From (9), the decision to delay the delivery (a high $T$) – given the client's choice of quality – depends on the parameter ($u_2$), i.e., how the client evaluates the time. A client placing higher importance on the time ($u_2$>1) makes ($1.5LK^{1.5}u_2$>$1.5LK^{1.5}$) and $T$ bigger (negative = anticipate the delivery), and the client placing less importance on the time ($u_2$<1) makes ($1.5LK^{1.5}$>$1.5LK^{1.5}u_2$) $T$ smaller (positive = delay the delivery) because the vendor believes to be working with a low-cost client and delays might not result in contract break.

Since $K$ and $L$ are constants well-known by the software vendor that represent the cost of producing a particular software product (unalterable in the short run), the vendor's decision focuses primarily on their beliefs for the parameter $u_1/u_2$, which represents the client's sensitivity to changes in quality and delivery time. Assuming the quality is fixed before the agreement is signed and there is no possibility for the client to lower specifications and requirements for the software or service and that in this kind of outsourcing arrangement the vendor cannot negotiate the functionalities which the client needs for the software required, the evaluation for this parameter ($u_1$) is not crucial for the vendor's decision to delay the delivery time.

## Asymmetric Information Scenario

An ITO arrangement under perfect incomplete information (p = P = 0.5) such as the model in the prior section, having the client option on the highest quality product, results in the vendor optimally responding by not delaying because, everything the same, the vendor cannot perceive a good judgment on how much the client evaluates the eventual deficiency to comply the agreement. When the client imposes monetary sanctions such as fines for each day of delay, the incentive signs the client's evaluation regarding the time for the delivery and provides the vendor with the strategic knowledge of the client importance for delays and consequently type of client. The prior

model can be adapted for a scenario under asymmetric information:

$$max\ U_{tot(Q,\ T)} = \left\{ G + \mathrm{E}(G_f) - \left( C_f + \frac{Q^b LK}{T(P)} \right) + T(1 - u_3 I) \right\} + u_1(Q + Q_f) - G - \mathrm{E}(G_f) - (I - u_2)T \quad (10)$$

Whenever the vendor delays the delivery, $T_2$ is greater than $T_1$, $T$ is positive, and the vendor pays the incentive $u_3 I$ (fine) to compensate the loss in utility ($u_2$) by the client. Whenever the vendor anticipates the delivery, $T_2$ is smaller than $T_1$, $T$ is negative, and the vendor receives an incentive $u_3 I$ (bonus) by the client to compensate the loss in utility by applying more efforts in the project. Assuming the client rationally impose a penalty or bonus equals to his loss or gain of utility, the incentive $I$ (bonus or fine related to the time) is defined as follows:

$$I = u_2 = \begin{cases} bonus \text{ when } T_1 > T_2 (T\ negative) \\ fine \text{ when } T_2 > T_1 (T\ positive) \\ 0, \text{ when } T_2 = T_1 \end{cases} \quad (11)$$

And equation (10) turns to

$$max\ U_{tot(Q,\ T)} = \left\{ \mathrm{E}(G_f) - \left( C_f + \frac{Q^b LK}{T(P)} \right) \right\} + T(1 - u_3 I) + u_1(Q + Q_f) - \mathrm{E}(G_f) \quad (12)$$

where $\mathrm{E}(G_f) = (p)G_f + (1 - p)G_f$. The loss (or gain) in utility by the vendor can be more than the loss (or gain) in money (when $u_3 > 1$) or can be less (when $0 < u_3 < 1$). The term $u_3$ represents the vendor's sensitivity to the value of the bonus or the price of the fine. Given the vendor's sensitivity to the price of the delay, this degree of importance is established as a function of the firm's endowment, i.e., the evaluation on the cost of the same fine varies with distinct companies – bigger software houses may be more willing to pay the delay's penalty than smaller software firms.

## Contract Performance

We depart from Fig. 1, where the client must describe a non-general purpose software contract with detailed features and the vendor must respond by delivering the ordered software. From the initial configuration, there will be a monetary incentive or disincentive whenever the outcome does not meet the agreement in relation to the time and the client's expectations – either by exceeding expectations, when $T_1 > T_2$, in which case the vendor must receive the payment of a bonus, or by violating the expectation, when $T_1 < T_2$, which makes the client charge a fine. The incentives are introduced in t5 and t6. The possibility to renew the contract or provide new products depends on the needs of the contracting organization and the (possible) payment of fines.

The imposition of fines and bonuses leads to asymmetric information for moving the vendor's beliefs in terms of probabilities from an uncertain situation where the client's value about the delivery time was uncertain to a situation where the client reports his evaluation of time within the incentive in the form of a bonus or penalty. The first-order condition for the model in equation (12) with respect to the quality remains the same, as designated by equation (5); the choice of $T$, however, is changed from equation (6) to

$$\frac{\partial U}{\partial T} = 1 - \left( Iu_3 + \frac{Q^b LK}{0.5T^2} \right) = 0 \Rightarrow T = \left( \frac{Q^b LK}{0.5 - 0.5Iu_3} \right)^{\frac{1}{2}} \quad (13)$$

Assigning $b = 1.5$ and using backward induction in the contract surplus to evaluate the Agent's best response to the Principal's choice results in the following choice of $T$:

**Contractual Misincentives in the Outsourcing of Information Technology: A Principal-Agent Approach, Fig. 1** Extensive form of an IT outsourcing arrangement under incomplete information

$$T = \left[ \frac{LK \left( \frac{0.5Tu_1^{\frac{1}{(1.5-1)}}}{bLK} \right)^{(1.5)}}{0.5 - 0.5Iu_3} \right]^{\frac{1}{2}} \tag{14}$$

which can be simplified to

$$T = \frac{1.5LK^{1.5}(1 - Iu_3)}{{u_1}^3}$$

The difference from the scenario with no clauses of incentives (incomplete information) of equation (9) to the scenario with the imposition of monetary incentives (asymmetric information) of equation (14) is the decision-making shift from an unknown parameter ($u_2$) to the client evaluation on the marginal variation of the delivery time ($u_3$). The Agent in the equation (14) assumes a signal of the client's type. The choice of $T$ depends on how the vendor evaluates the cost of the fine charged by the client (or the benefit of the bonus) $u_3$. If the client imposes a very costly fine (big $I >> 1$) but the vendor considers it inexpensive (very small $0 < u_3 < < 1$), such that ($0 < Iu_3 < 1$), then equation (14) turns to be positive and $T = T_2 - T_1 > 0$, meaning the vendor is delaying rather than anticipating the delivery date. When the client imposes a small fine (small $0 < I < 1$) but the vendor considers it expensive (very big $u_3 > > 1$), then equation (14) turns to be negative and $T = T_2 - T_1 < 0$, meaning that the vendor anticipates the delivery date.

## Numerical Example

In the arrangement of incomplete information, the choice of $T_2$ (and consequently $T$) depends on how the vendor believes their client has evaluated the time needed to conclude the outsourcing. From the vendor's point of view, when $u_2$ is big, the vendor gains more by not delaying because the satisfaction of this type of client is easier to increase than it is for a client with low $u_2$. The vendor has a dominant strategy to not delay the delivery if no other strategic information is provided to justify the otherwise. Figure 1 presents this kind of agreement under incomplete information including a notion of values for the payoffs of the Principal and the Agent.

The payoffs in the extensive set of Fig. 1 are assigned according to the model described by equation (3) as a simple example of this scenario. The dashed line at the intersection of each decision branch and in the terminal arrows conveys both the Agent and the Principal lack of information about the other's cost structure and therefore do not know which type (high/low cost/productivity) to be dealing with. Assuming perfectly incomplete information for both parties, there is no reason for the client to believe the vendor has a higher probability of being highly productive than of being less productive. By the same reasoning, there is no space for a vendor's similar belief to be dealing with a high-cost client rather than a low-cost one, thus p = (1-p) = P = (1-P) = 0.5. Analyzing the expected payoffs for the Agent, we have:

1. Expected payoff when the Agent chooses to delay (D) a low-quality (LQ) software: $0.5^*1 + (1 - 0.5)^*5 = 3$
2. Expected payoff when the Agent chooses not to delay (ND) a low-quality (LQ) software: $0.5^*3 + (1 - 0.5)^*3 = 3$
3. Expected payoff when the Agent chooses to delay (D) a high-quality (HQ) software: $0.5^*0 + (1 - 0.5)^*2 = 1$
4. Expected payoff when the Agent chooses not to delay (ND) a high-quality (HQ) software: $0.5^*2 + (1 - 0.5)^*2 = 2$

Three possible Nash equilibriums can be found for the Agent: (HQ, ND), (LQ, D), and (LQ, ND). The expected payoffs for the Principal are:

5. Expected payoff when the Principal chooses low-quality software and the Agent chooses to delay: $0.5^*1 + (1 - 0.5)^*1 = 1$
6. Expected payoff when the Principal chooses low-quality software and Agent chooses not to delay: $0.5^*2 + (1 - 0.5)^*2 = 2$
7. Expected payoff when the Principal chooses high-quality software and the Agent chooses to delay: $0.5^*4 + (1 - 0.5)^*4 = 4$
8. Expected payoff when the Principal chooses high-quality software and the Agent chooses not to delay: $0.5^*8 + (1 - 0.5)^*8 = 8$

Choosing high-quality software and posing as a high-cost client are a dominant strategy for the Principal regardless of the strategy the Agent adopts because choosing a high-quality product will always provide a higher expected payoff (under the assumption the Agent is contractually obligated to provide the specified product). Thereby, the only equilibrium under incomplete information is the one where the client chooses high-quality software and the vendor does not delay the delivery: (HQ, ND) = (2,8) (see equation 9).

In the arrangements of asymmetric information, however, the results are changed. Equation (14) when compared to (9) brings an interesting result. The decision to delay is no longer based on beliefs. Now, the vendor has an asymmetric knowledge on the cost structure of the client, and the decision-making is based on his own evaluation of the imposed incentive. Thus, imposing a penalty over some outsourcing irregularity, such as a delay, may encourage instead of discourage the misbehavior because, everything else the same, the incentive may perform as a misincentive creating a sequential game of asymmetric information from the initial incomplete information arrangement. The situation where one player (in this case, the vendor) has strategic information concerning the other leads to a divergence from the initial equilibrium. Figure 2 illustrates this kind of agreement with asymmetry in information.

The payoffs in the extensive set of Fig. 2 are the same as Figure 1, with the difference in the way the Agent observes the terms of probabilities. The scenario of total uncertainty with perfect incomplete information (P = 1-P = 0.5) has turned to a situation in which the Agent believes the client has low or high cost with a higher probability. The Principal remains uncertain regarding the type of the Agent, whether the Agent has high or low productivity (depicted by the dashed lines at terminal arrows), and the expected payoff remains the same as before, choosing a high-quality product (HQ). The Agent's payoffs, however, are modified to include the incentive clauses. First, let us assume an expensive fine

**Contractual Misincentives in the Outsourcing of Information Technology: A Principal-Agent Approach, Fig. 2** Extensive form of an IT outsourcing game under asymmetric information

in the Agent's perspective. The situation signs a Principal profile characterized by a high valuation concerning the delivery time (e.g., P = 0.9). The Agent's expected payoffs in this situation are (given the client's choice):

Expected payoff when the Agent chooses to delay high-quality software: $0.9^*0 + (1 - 0.9)^* 2 = 0.2$

Expected payoff when the Agent chooses not to delay high-quality software: $0.9^*2 + (1 - 0.9)^* 2 = 2$

Thus, the equilibrium has the client choosing high-quality software and the vendor opting to not delay the delivery: (HQ, ND) = (2,8). Let us assume a second situation when the fine has, in the Agent's view, an inexpensive value. This inexpensive value signals a Principal profile characterized by a low valuation concerning delivery time and (e.g., P = 0). The Agent's expected payoff is:

1. Expected payoff when the Agent chooses to delay high-quality software: $0^*0 + (1 - 0)^* 2 = 2$
2. Expected payoff when the Agent chooses not to delay high-quality software: $0^*2 + (1 - 0)^* 2 = 2$

Since the expected payoff for delay is equal to not delay, the agreement presents two equilibriums having (1) the client choosing high-quality software and the vendor responding by delaying the delivery, (HQ, D) = (2,4), or (2) the client choosing high-quality software and the vendor responding by not delaying the delivery, (HQ, ND) = (2,8). This mixed-strategy equilibrium is not present in the sequential arrangement of incomplete information and additional equilibriums having the Agent's best response as a delay can be portrayed. The potential equilibriums with delays are direct results from (14), which cannot be observed in (9) when the misincentives are not designed.

## Conclusion

This work has investigated through a game-theoretic analysis how the imposition of bonus/penalty schemes for the delivery time of software projects in outsourcing agreements can lead to misincentives. As a result, the knowledge of the penalty reduces the Agent's uncertainty about the Principal's cost structure and may, therefore, lead to an intentional delay. In other words, when the software vendor has information about the client's cost structure provided by the value of the incentive, the outsourcing scenario characterized as a sequential game of incomplete information becomes a sequential arrangement with asymmetric information, and the vendor's delay strategy is modified.

Under the new circumstances, equation (14) states that the vendor's decision-making concerning the delivery time changes from an unknown parameter (pondered in terms of probability) to the interaction of two variables: the price of the fine (or bonus) $I$ and how costly (or profitable) it is in the vendor's perspective ($u_3$). Four scenarios compose the interaction between those parameters:

1. When the price of the monetary penalty is high (big $I$) but not sufficient costly (small $u_3$) to increase the efforts applied in terms of capital and labor by the vendor.
2. When both are insignificant (small $I$ and $u_3$), the vendor must choose to pay the fine and not increase the efforts and the incentive encourage the delay.
3. When the price of the monetary penalty is insignificant (small $I$) but in the vendor's perspective, it is costly (big $u_3$).
4. When both are costly (big $I$ and $u_3$), the vendor must choose to not pay the fine and increase the efforts, and the incentive prevents the delay.

Under certain assumptions, the equilibrium with delay (scenarios 1 and 2) cannot be observed when the incentive schemes are not imposed, which characterizes the presence of misincentives in the asymmetric outsourcing agreement. Much remains to be studied, and many potential determinants to be investigated with regard the theory of incentives in the ITO scenario and in the many areas of the outsourcing production of goods and services in private and public organizations; a more general model regarding these effects must be taken into consideration in future works.

# Control of Social Spending, Russia

Elena Gorina and Svetlana Biryukova
Institute for Social Policy, National Research University Higher School of Economics, Moscow, Russia

## Synonyms

Control of social expenditure; Public spending; Social expenditure; Welfare expenditure

As defined by the OECD and following the international practice, social spending includes all public costs incurred by paying benefits, providing goods and services, as well as tax deductions and discounts, made for social purposes. Among the beneficiaries of these payments and services may be low-income households or certain social groups, such as the retired, disabled, sick and temporarily disabled people, unemployed, and some others. Social spending is generated by such systems as pension plans, healthcare, education (the OECD statistics covers only early childhood education and care), labor market programs, housing, and family policies. This spending is aimed at redistributing resources across households or targets all the citizens and implies compulsory participation. Apart from the definition above, some Russian authors interpret public social spending broader and include funding of the whole education system and add expenditures on the culture, mass media, physical education, and sports on the top. At the same time, tax spending remains unaccounted for in Russia.

Public social spending in the developed welfare states has been increasing for the last half century, and at the moment it has reached historically high level in most of the OECD countries. On the average, the advanced economies are spending 21% of their economic resources on the social sphere (OECD 2016). BRICS member states, Russia among them, according to the most recent data available, show a lower rate, with Brazil spending about 18% of its GDP; South Africa – 9%; China – about 7%; and India – less than 5% (OECD 2014).

Russian government has been increasing its social spending since the second half of 2000s. At that time, the increase was supported by the economic upturn and changing public and political agenda in the country. Despite the fact that worsening macroeconomic situation has curbed the growth of the Russian economy and budget revenues in the recent years, Russia is still close to the advanced nations in terms of its social spending. In 2015, total social spending in this country accounted for 17.4% of GDP according to the cost structure, proposed by the OECD, or 20.3% of GDP when accounting for funding of all levels of education.

However, the constant expansion of the social spending reflecting the permanently growing scope of the redistribution of financial resources is impossible due to the economic limitations. This fact raises the question of the *control of social spending* together with the issue of increasing their cost-effectiveness.

## Control of Social Spending Concept

What does the *control of social spending* stand for? Those who study public finances predominantly view the spending control as an ability to adjust its amount (increasing or decreasing) and,

respectively, its share in the structure of the budget expenditures. From this point of view, and also bearing in mind a long-standing trend of increasing social spending in most developed countries, control of social spending usually stands for its restriction at the macro level. Such a restrictive policy facilitates a balance between budget expenditures and the country's economic capacity.

At the level of certain social sectors or social programs, spending control regulates three complex key characteristics that directly impact the scope of expenditure. Kirchheimer (1989) calls them *gate variables*, which are the beneficiary population, program content, and financing rules. The last two of these characteristics and their components are the most controllable ones by state and local authorities and can be regulated by legislative and administrative measures. On the contrary, the components of the beneficiary population affecting the amount of spending—such as population size and income rate, territorial mobility, or eagerness to participate in the programs—these parameters go beyond the government control. The authorities can impact them only indirectly, through their interdependence with the components of other key variables of social programs.

Apart from that, a whole range of circumstances may obstruct the spending control at the level of certain programs and activities. Among them are factors of a more general nature, such as long-term trends at the macro level (demographic changes, higher or lower real wages, inflation rate, globalization processes, etc.), political groups and other advocacies lobbying their interests, or populist decisions in the light of upcoming elections. At the same time, control of spending can be hampered by the decisions directly related to the implementation and funding of social programs. From the administrative point of view, it is much more difficult to regulate spending on the open-end, enshrined in the law programs or on the programs assuming a regular adjustment for inflation—such as, for instance, social benefits with annual indexation.

## Managing Social Spending and Its Structure in Russia

The observed considerably high level of the overall social spending in Russia is mainly maintained by the cost of the state pension system (Fig. 1). The accelerated pension indexation policy and the reevaluation of pension rights in 2009–2010 allowed to promote the retired people's income level during the economic crisis, but increased total share of the spending on pensions up to 8–9% of GDP.

Another 4% of Russian GDP, or one fifth of the total country social spending, is allocated in the sector of social protection. However, the means-tested social programs, addressed to the poorest social groups, do not take a big share of it, accounting only for 15% of social support spending from noninsurance funds.

Meanwhile, compared to most of OECD countries, Russia spends less on education and health (including mandatory health insurance expenditure). In the recent years, there is a trend to reduce spending in these areas compared to economic performance.

To ensure better balance under the current macroeconomic conditions, the federal budget of Russia and most of regional budgets have been revised in 2014–2016 to compress their expenditure commitments, including the ones of social programs. New budgetary restrictions entailed a dramatic slowdown in the growth of public social spending at all levels of budgets. The most significant reductions were introduced in the education sphere, where the federal budget and the budgets of every fourth region have been trimming nominal spending 4–5% per year in 2014–2016.

Federal decisions make it difficult to regulate social spending at the subnational level. The President signed into law a dramatic increase in the pay of public sector employees in the areas of education, academia, health, and social care in 2012–2018. The financial burden of these decrees lies on the consolidated subnational budgets, as most of social sphere workers (from 85% to 99%, depending on the category) are employed by the organizations, controlled by regional and local authorities. In the absence of new sources of

**Control of Social Spending, Russia, Fig. 1** Public social expenditure in Russia by broad social policy area, as a percent of GDP, 2007–2015. Notes: (1) These are allocations from budgets of all levels (federal, regional, and local) and also public extra-budgetary funds in the domain of mandatory pension, social, and health insurance. (2) Partially, the observed drop in social spending in 2014–2015 is due to a new methodology of GDP calculation. (Source: calculation based on the Federal Treasury data)

funding, it resulted in reallocation of subnational budget spending for more priority areas, thus diverting it from other domains. Besides, the regional authorities had to develop and execute measures, necessary to improve the efficiency of social spending. Many regions restructured social service providers and optimized or, more often, reduced the personnel headcount.

Regulation of spending on social support programs in Russia has its own peculiarities. First, there is less room for reduction than in other areas of social policy, as most of this spending is about funding termless commitments to providing cash and in-kind benefits that are usually adjusted to inflation and see an increase in the number of beneficiaries. Second, the Russian system of social protection serves as a channel of communication between the authorities and the voters, making it socially and politically sensible. That is why any changes in this sphere should be done with caution.

Nevertheless, certain measures to curb the growth of spending on social protection were recently introduced both at the federal and regional levels. Most of these decisions concern changing the financing rules for social programs and modifying the eligibility rules for the consumer participation. First of all, over the last years, many social benefits were not indexed at all or were adjusted below the inflation rate. It mainly concerns the biggest budget allocations such as pensions or maternity (family) capital program. Second, many regions tighten requirements to the beneficiaries of social benefits aiming at reducing their number: some benefits are no longer paid to the whole category but are allocated in a targeted way, only to low-income individuals and households. In parallel, the means-testing procedures are being amplified, and some regions introduce a residence qualification, i.e., set a minimum period of permanent residence in the region as a prerequisite for social programs. For the purpose of regulating the list of their social commitments, certain regions set validity period for some of them. At the same time, rolling back or suspension of the social

programs is less popular and is usually applied only to small scale and less expensive ones.

Control of spending in the pension system has become a particular problem for Russia. Gradual increase in the number of retired people, due to aging of the population and better life span, resulted in a disparity in this segment of social spending. Growth in the burden owing to the elderly destabilizes the Russian pension system as it was designed to fund its current commitments at the expense of current mandatory insurance contributions and federal budget transfers. The share of the latter in the overall amount of the pension fund's yearly spending on pension benefits has been fluctuating over the last few years and reached 37% in 2015.

Recently, certain changes have been adopted to alleviate the problem of funding pension commitments in the short run. These include moratorium on the voluntary (contributory) pension savings in 2014 and its subsequent extension to 2015 and 2016 together with the suspension of the pension law regulation concerning annual pension indexation in 2016. Besides, certain reforms are being discussed, such as a private pension provision scheme for early retirees, a restriction of pensions paid to those who still work upon attaining the pension age, and an increase of the retirement age with the purpose of controlling pension system spending. At the moment, certain measures were taken only to reform early pensions. In 2013–2014, the new regulations were adopted to accrue additional contributions to the pension fund for those employers, who create jobs characterized by hazardous or harmful working conditions of various kinds leading to early retirement. Yet, none of these measures have been adopted in full.

## Control as the Efficiency and Effectiveness Management

It would be inappropriate to consider *control of social spending* only as a regulation of the amount of budget allocations without looking at other aspects. Control of public spending also may be regarded as a means of its efficiency and effectiveness management. The improvement of the efficiency and effectiveness becomes a priority task of public administration in the context of ever-increasing pressure of social commitments on public finance.

According to the theoretical concepts developed over decades of economic research, evaluation of the budget expenditures relevance might be conducted basing on the three following indicators: economy, efficiency, and effectiveness of public spending. These indicators allow embracing in one single evaluation framework the inputs, the outputs, and the outcomes of any publicly funded activity, including social programs (Noman 2008).

At the internal level of control, the evaluation of the public spending relevance represents a component of the results-based management process. This evaluation, called performance management, defines the outputs and outcomes of a publicly funded activity to ensure the progress of program towards pre-established goals, taking the assigned tasks and the imposed functions into consideration. Such a monitoring lies in the scope of public authorities, responsible for planning and implementation of the social programs. Longstanding practice of performance budgeting shows that such evaluation runs into problems right at the planning stage: for adequate efficiency and effectiveness measurement it is of critical importance to correctly set the objective of a program, its expected outcomes and indicators, which will show whether these results are achieved.

External control is a performance auditing of public spending. It is broader by its content than performance management and less formalized (INTOSAI 2004). Authorized Supreme Audit Institutions execute this function in the interests of public control over the activity of public authorities.

In Russia, efficiency and effectiveness management of social spending is executed at both levels, internally and externally.

Results-based management approach was first applied to the internal management of the Russian social programs of all levels, from federal to

municipal, in early 2000s. At the moment, this approach has become a standard for development of public programs throughout the country. Still, the implementation of the results-based management approach in this country is far from being successful.

Results-based management at the level of each and every program document implies setting goals and tasks of strategic development of given area or direction, making an action plan for every objective and developing a system of targets and monitoring indicators. It is the integrity of all these three components that secures the program's effectiveness. At the moment, in the most of program documents in Russia, these three components are contained only technically, without any interconnection. The likely cause of the problem is that results-based management is applied primarily at the external level. It means that program documents just provide a new package for already ongoing activities and existing indicators. As a result, many challenges of efficient management remain unaddressed. Drafted documents do not set proper expected results and relevant indicators to measure programs' achievements. Such a situation can be illustrated by a package of federal strategic documents, *National Strategy of Actions in the Interests of Children for 2012–2017*, and its *Action Plan*. According to the experts, in 20% cases the actions have no connection with the set goals or efficiency indicators.

The external control in Russia is exercised by the Accounts Chamber (see reference for the web address), which conducts a regular and detailed performance auditing of the federal and regional budget spending and spending of public extra-budgetary funds on certain items of expenditure, including those from the social sphere.

# Convergence of Mainstream Public Finance and Islamic Finance in Public-Private Partnerships

Hanna Kociemska
Wroclaw University of Economics,
Wroclaw, Poland

## Synonyms

Heterodox public finance; Trade-offs between Islamic finance and mainstream finance

## Definition

Mainstream finance – economics phrase used for describing schools and scientific achievements of finance discipline that are accepting neoclassical paradigm.

Heterodox – the notion of heterodoxy stems from the Greek héteros (different, other) and dóxa (doctrine). The term denotes those creeds,

beliefs, or teachings, religious ones in particular, that are different from the norm of a given religion; they are the opposite of orthodoxy. In economics, heterodoxy pertains to an evolutionary approach to the economy.

Heterodox approach to the public-private partnership – the convergence of mainstream public finance and Islamic finance in project finance.

## Introduction

The appearance of public finance crises in conventional economies urges us to reflect on the causes of imperfections in public funds management. Governments' previous initiatives to stabilize finances and to improve social well-being, using mainstream finance and the experience of the economic society, have failed and have not brought the expected results. Reducing public spending and increasing fiscal burdens are met with social refusal. In addition, progressing stagnation in the implementation of both public and private investments reflects the uncertainty of current market conditions and the impasse in the performance of state functions. Within the confines of the European Union are its pillars, such as the monetary alliance, regional and social policy, etc., which, despite the progressing globalization and internationalization of individual economies, are inadequate to the current domestic problems of the individual countries. The unification of public policy, including the level of public debt, does not contribute to the improvement of the situation. The unfavorable demographic trends in Europe and the migration of the population both deepen the crisis of social policy. Meanwhile, Islamic countries have seen another type of challenge facing public finance managers, who have found it necessary to find greater opportunities for budgetary income diversification and the disappearance of the Islamic system's isolation from the conventional financial system. The large Islamic capital and assets facilitate their expansion into external markets and the widespread use of assets and financial structures based on them to make the necessary investments. Opening up to new markets will contribute to the acquisition of knowledge, which is often a barrier to the development of Islamic countries. It seems necessary to popularize the principles of the Islamic Moral Economy (IME) as honest, transparent canons of performing state functions, economic development, and ensuring social well-being in a globalizing world. The sub-Saharan African region is a key area that is dependent on both conventional and Islamic financial systems. The countries of this area represent high economic and social potential, but they require real, deliberate interventions to introduce public policy, transparent public finances, and profitable economic bases for private investors (*Mapping Africa's*). The necessity of protecting these markets against "new colonialists," depriving the continent of valuable assets, is increasingly clear.

Therefore, to undertake this topic related to the search for new public finance rules appears to be particularly relevant and useful. The presented scientific analysis confirmed the hypothesis convergence exists and is understood as convergence in selected areas of conventional public finance and of IME, for the development of emerging and developing economies wishing to implement public-private partnership (PPP) investments. This idea is a manifestation of the search for a theoretical model that explains the ever-changing reality. It gives the foundation for shaping new conceptual solutions in the area of public finance in emerging, developing countries, particularly in sub-Saharan Africa region. It is a kind of provocation that encourages the revision of the perception of the often-disjointed systems of conventional public finances and Islamic finance. As a consequence, it allowed the creation of a new concept called heterodox approach to PPP, theoretical solution, attractive and adequate to the needs of the market, in times of uncertainty and crisis of public worldwide. The conducted discourse is a contribution to the further discussion on the development of public finance theories and the inclusion of various developments, including the IME. Thus, the heterodox approach in PPP directs to obtain the convergence between selected goals: conventional private investors – maximizing profits, Islamic investors – maximizing social well-being and profits, as well as the

public entities goals, provision of public services with specified quality and accessibility. At the same time, the proposed platform for the interpenetration of both financial systems and the principles of financial management (public or private) guarantees equal opportunities for cooperation between those parties from different socioeconomic and religious orders. Each partner waives some of their rights, invests what is their key material or financial capital, and seeks to achieve stable, predetermined shared profits over the long term, with particular emphasis on the positive impact of cooperation on the society. The proposal for a heterodox approach to PPP may prove to be an appropriate solution for many globalizing economies, not just emerging or developing countries but mainly those looking for new financial management pillars and shifting away from cumulative external financing for greater use of their own economic or social attributes and assets. Due to the inadequacy of the current theoretical models, which do not fully explain the reality and do not permit the possibility of permeating selected conventional and Islamic finances, new, more reliable solutions are sought. The heterodox approach to PPP presents a solution that is beneficial for many types of partners, including public and multicultural societies, conventional investors, and Islamic countries, as well as from sub-Saharan Africa region. It contributes to the aforementioned continuous development of the financial discipline and the shaping of the new trend in the subdisciplines of public finance.

## Convergence of Public Finance and Islamic Finance

The heterodox approach to the PPP is an initiative carried out under the conditions of conventional finances, as well as Islamic finances in emerging and developing countries. It is a manifestation of the search for general solutions in the subdiscipline of public finances and the evolution of finances toward the convergence of conventional and Islamic finance. The concept of the heterodox approach to PPP is based on the convergence between selected private conventional investors' objectives, such as profit maximization, and Islamic investors' goals, i.e., the maximization of social well-being and profitability, as well as public entities' objectives, namely, the delivery of public services characterized by a given quality and accessibility. In addition, thanks to the combination of the theoretical characteristics of the public finance and Islamic finance systems, in order to create a common ground for consensus among private and public investors who are particularly active in emerging and developing countries, where the political and socioeconomic law is lacking and the conditions of operation are continually changing, PPP is a crucial process for achieving convergence. It provides the possibility of long-term collaboration between partners operating according to different canons of financial studies. The critical Islamic finance rules that theoretically enable the idea of convergence are profit and the loss-sharing rule, asset-based investments, and no risk transfer, fixing the *nisaab* level (defined as the minimum amount of profit below which, according to Sharia law, one is not required to pay zakat), whereas if profit exceeds this, then zakat becomes incumbent (Surah Baqarah Ayat 267; Sura Al Anam Ayat 242; Surah Taubah Ayat 34, 60 and 103). The postulated heterodox approach toward formulating PPP projects may become a platform for the fitting and coexistence of selected elements of conventional and Islamic finance to achieve synergy in the development of these countries, as well as to carry out joint investments in new economic areas. The territories to which this concept is more applicable are emerging countries, as well as countries characterized by atrophy of statehood. Such a region, among others, is sub-Saharan Africa, where no stable frameworks of financial systems have been observed thus far (Porter and Schwab 2008). Using the proposed theoretical model, such countries could have access to knowledge of the basics of new social and economic solutions, pertinent to local operating environments, in particular considering religion, due to the great Islamization of the region. The new forms of management can be manifested with a heterodox approach to PPP, which inherently combines the goals and rules of management implemented by both public and private partners. Reaching a

consensus always requires giving up some authorizations, as well as preceding the maximization of revenue to work out everyday goals that will be satisfactory for both parties in the course of a long-term formal collaboration (Kociemska 2010). The heterodox approach to PPP is a theoretical model aiming to explain the consistently changing reality, raising many concerns regarding the existing forms of public and private partnerships to improve upon them.

The results of the theoretical analyses enabled the development of the fundamental principles of a heterodox approach to PPP, in which:

- The principle of Pareto efficiency is rejected.
- The arrow's utility function is changed into a developed idea of the social utility of business.
- True corporate social responsibility is introduced for both private and public entities.
- Conflicts between the agent and the principal are avoided by setting goals and targeting financial results in advance.

In the case of PPP implemented by conventional and Islamic investors, adhering to the heterodox approach would mean that the goal of the PPP would be to provide a set quantity and quality of public goods to society while ensuring a satisfactory profit for owners. Moreover, all investment projects in PPP would be carried out according to the principles of corporate social responsibility. The PPP agreement would be drafted in a way that would cause a predetermined part of surplus funds to be transferred to the designated eligible entities while ensuring profit for investors and the sufficient quantity and quality of public goods for society. In this way, private investors would never maximize their profit but, instead, settle for obtaining a predetermined profit in a long-term project (Kociemska 2017). The first condition for the implementation of PPPs based on the proposed heterodox approach assumes the fulfillment of the PPP's primary public purpose, i.e., the long-term provision of services or goods at a predetermined price by the public-private entity, in line with the availability and quality of these services and goods for the local community set forth in the PPP agreement. The principle of Pareto efficiency is therefore rejected. This would result in a situation, where improving the benefits for one person would be impossible without decreasing them for someone else. Here, however, we aim at reaching a consensus between the expectations of profit by private investors, as well as fulfilling the well-being goals of public entities. Achieving one of the goals cannot mean the rejection of the second key goal. The second condition of the proposed solution concerns the obligation to observe the principles of corporate social responsibility, which exist in the conventional conditions, however, not as a general trend or one that is mandated by law in conventional environments. It should be assumed that, for an Islamic investor, the condition of social well-being is an obvious translation of the Quran's injunctions and the fundamental purpose of doing business in Islam (Chaudhury 2006; Shaykh Muhammad Taher, Khutbah 2006). This injunction, as mentioned earlier, is religious and not subject to discussion; however, it conditions the ability of an Islamic investor to do business. For a conventional private investor, this will be a new tool. The amount of money transferred above *nisaab* will always be subject to negotiation between partners; although if it is established in advance, it will protect the investor from moral hazard and seek other ways to maximize profit function. Forcing a conventional investor to support the social well-being of users, who take advantage of the infrastructure built and managed as part of the PPP, can bring mutual benefits. On the one hand, the final beneficiary (community representative) will have access to the desired public service. On the other hand, a private entity will make a predetermined profit by having regular users of the infrastructure that was built and managed by the entity. The third condition also fully implements the function of a PPP. For example, referring to the rules for the functioning of publicly or privately funded schools, if the costs of school admission are fixed (there is a fixed set of procedures, technologies, tools, and labor costs associated with the provision of each education procedure), then with a fixed value of revenue (the public or private payer pays a predetermined amount of education levels to the school), the public-private investor should agree to a predetermined profit. Then, they can also agree to a predetermined value of financial transfers above *nisaab* directed to those who might be excluded

from access. Why would partners not maximize their profit function by accepting financial transfers above *nisaab* and a predetermined level of profit? The answer is that, because there is no large cost savings potential, taking into account the fixed level of funding from the public or private payer for education would not result in a lower quality of services provided. Thus, the public payer not only carries out public services for the community (access to education) using a special purpose vehicle (Boussabaine 2007) but also redistributes the surplus over *nisaab* in the place where it is actually produced (which will be more efficient and procedurally cheaper from the point of view of the society). It is, therefore, consistent with the theory of Islam on the one hand, and on the other, it gives a real chance of reaching a compromise between the two investors who come from different economic systems. The other rational answer is that the investors are seeking to obtain long-term financing for services with stable social demand, just to bypass the highly competitive market. This will enable the dispensation of the market fight for customers, as in the offer of regular private services. Furthermore, private investors will be interested in getting social acceptance of the project, which provides equal opportunities for access to all community members (Fig. 1). Thus, they will be assured, as social acceptance is important for the

**Convergence of Mainstream Public Finance and Islamic Finance in Public-Private Partnerships, Fig. 1** Source: own

long-term sustainability of a project. Otherwise, it is all the more important concerning the aspirations of investors in search of new markets. Conducting socially responsible business might open doors to enter new markets, where Islamic finance is well established due to the progressively stronger Islamization of the economy, like in the sub-Saharan region of Africa.

## Conclusions

The success of the possibility of interpenetration and coexistence of conventional and Islamic trends in a heterodox approach to PPP may depend on an adequate interpretation of the Islamic religious principles and the current achievements of the science of public finance. Another factor contributing toward the symbiosis of these two systems would be a compromise between the primary management goals of profit and social well-being. The proposed heterodox approach to PPP is in line with the expectations, preliminary reports, and considerations of economists in the area of new trends in economics but from a much narrower perspective, implying the proposed rules for financial instruments and risk management solutions for investment projects. Besides, principles have to be developed to encompass a wide range of issues, including ethics, morality, and honesty toward society in the area in which the investment is carried out. The convergence of investor expectations with the needs and expectations of local communities can be achieved through the use of combined principles of conventional and Islamic finance, determining the value of nisaab and transferring the earnings above the predetermined profit level to society, while satisfying partners with a return on investment rate with a long-term perspective. Summing up, the table below presents the elements of the new PPP approach from the viewpoint of each PPP partner (Table 1).

The vision of public finance development presented herein is based upon the use of possibilities offered by the existing schools of economic thought, neoclassical theories that are critical toward them, as well as the religious and social trend of the Islamic Moral Economy. The selected public finance theories may, in their component elements, be compatible with the principles of Islam. The proposed heterodox approach to public finance theory, although referring herein specifically to PPP, lays foundations for the development of long-term forms of international cooperation

**Convergence of Mainstream Public Finance and Islamic Finance in Public-Private Partnerships, Table 1** Elements of the new heterodox approach to PPP

| | Public partner | Conventional private partner | Islamic private partner |
|---|---|---|---|
| Project profitability | Not important | Predetermined level of profit | Predetermined level of profit |
| Motivations to step in the project | Providing public services of a certain quality and accessibility | Profit | Profit and socially responsible corporate governance |
| Expected results of cooperation | Providing services in uninterrupted mode | Profit | Profit and supporting people in need, according to Sharia law |
| Criteria for success | Possible convergence between selected conventional public finance and Islamic finance | Possible convergence between selected conventional public finance and Islamic finance | Possible convergence between selected conventional public finance and Islamic finance |
| Key attributes | Sustainability | Increasing the value of the company, obtaining the predetermined level of stable profit | Responsiveness increasing the value of the company, obtaining the predetermined level of stable profit Socially responsible corporate business |

Source: own

under PPPs. The successful convergence and coexistence of conventional and Islamic trends may depend on the proper interpretation of Muslim religious rules and current achievements of financial sciences. Another determining factor for the symbiosis between both systems is to achieve a compromise between the basic objectives of economic activity, such as profit and social welfare. The proposed heterodox approach to PPP is consistent with and reflects those expectations, preliminary findings, and deliberations of the above-named economists in the area of new trends in economics, although to a much narrower extent, as it applies the proposed principles to financial instruments and solutions with respect to risk management in investment projects. What is more, the developed principles broadly reflect the ethics, morality, and fairness to the society in the area in which the investment project is being implemented. The convergence between investor expectations and the needs and expectations of local communities may happen in reality with the application of combined conventional and Islamic finance principles, determination of *nisaab*, and financial transfers in excess of a predefined profit level to the society, while simultaneously ensuring partners' satisfaction with the level of return on investment in the long term. It is a solution adequate to every model of economy, with particular emphasis on developing countries, and one that offers opportunities for both conventional and Islamic investors, including the public ones, to expand into new markets.

# Coopetition in the Public Sector

Jan Stentoft, Mads Bruun Ingstrup and Ole Stegmann Mikkelsen
Department of Entrepreneurship and Relationship Management, University of Southern Denmark, Kolding, Denmark

## Synonyms

Collaboration; Competition; Cooperation

## Definition

Coopetition is a paradoxical relationship between two and more actors simultaneously involved in cooperative and competitive interactions, regardless of whether their relationship is horizontal or vertical (Bengtsson and Kock 2014).

## Introduction

The concept of coopetition highlights the situation in which actors both cooperate and compete with each other (Brandenburger and Nalebuff 1996; Lado et al. 1997). So far, the concept is well researched in a private-sector context but lacks investigation in a public-sector context (Stentoft et al. 2018). Thus, at least three reasons contribute

This entry is an abbreviated version of the following publication: Stentoft J, Mikkelsen OS, and Ingstrup MB (2018) Coopetition segments in a public-sector context: insights from a business region. Int J Pub Adm 41(13): 1084–1094.

to the importance of studying coopetition in the public sector. First, with the implementation of New Public Management during the last few decades, it has become vital to understand how public-sector actors can contribute to a better and more inexpensive public sector by both cooperating and competing. Second, it is relevant to know how coopetition plays out in the public sector, as the overall objectives and logics fundamentally differ between the private and public sector. Third, the geographical framing of the public sector and its different administrative layers influence the patterns of cooperation and competition and therefore also the nature of coopetition.

Following these considerations, the purpose of this entry is to explore and further position the concept of coopetition in a public-sector context. This is specifically done by developing a coopetition segmentation model for identifying and describing public-sector coopetition segments. The empirical point of departure for this investigation is a polycentric and voluntarily formed business region in Denmark named the Triangle Region. It consists of seven municipalities that both cooperate and compete.

The remainder of this entry is structured as follows. First, the concept of coopetition is outlined by enumerating its major characteristics. In the subsequent section, the coopetition segmentation model is developed, and finally, the entry concludes by highlighting theoretical findings as well as practical implications.

## The Concept of Coopetition

Emerging from game theory, coopetition has become a robust concept in the field of strategic management (Dorn et al. 2016), and to date, research on this topic focuses mainly on these five themes: (1) nature of coopetition relationships, (2) governance and management of coopetition relationships, (3) output of coopetition relationships, (4) actor characteristics in coopetition relationships, and, lastly, (5) environmental characteristics influencing coopetition relationships (Dorn et al. 2016). In the wake of such overviews, it is observed that research on coopetition is mostly dealing with explorative rather than exploitative relationships and that the concept is analyzed at different aggregated levels: individual, intrafirm, interfirm, and network.

However, according to Bengtsson and Kock (2014), no consensus has so far been reached on how to define coopetition, but the many diverse definitions seem to cluster in two groups: a broad and a narrow group. The broad-definition group stresses coopetition takes place in a value net comprising an actor's suppliers, customers, competitors, and complementors (Brandenburger and Nalebuff 1996). The narrow-definition group comprehends coopetition as only when cooperation occurs between two directly competing actors (Bengtsson and Kock 2014). Along this framing, Bengtsson and Raza-Ullah (2016) detected two schools of thought on coopetition: the actor school and the activity school. The actor school recognizes coopetition as when cooperation and competition are divided among diverse types of actors in a particular context. In contrast, the activity school acknowledges coopetition as when actors simultaneously cooperate in some activities and compete in others.

In and across these two schools, research focuses primarily on motives, likelihood, interaction, processes, and outcomes of coopetition (Bengtsson and Kock 2014), and these themes have been elaborated on in Bengtsson and Raza-Ullah's (2016) framework on drivers, processes, and outcomes for coopetition. In addition to these discoveries, Dorn et al. (2016) introduced a four-phase model of coopetition that contributes an understanding of how coopetition develops. The four phases are (1) antecedents for coopetition, (2) initiation phase, (3) managing and shaping phase, and (4) evaluation phase. This understanding of coopetition as a dynamic concept, combined with the previous insights on definitions and schools of thought, has set the scene for exploring coopetition further.

## Developing a Coopetition Segmentation Model

With the purpose of exploring and further positioning the concept of coopetition in a public

**Coopetition in the Public Sector, Fig. 1** Coopetition segmentation model. (Source: Stentoft et al. 2018)

sector context, a coopetition segmentation model has been developed (see Fig. 1). The model builds upon two scales – cooperation and competition – which vary from low to high. The scale of cooperation shows to what extent coopetition initiatives rely on involvement and contribution from many or few actors, and the scale of competition shows to what extent coopetition initiatives are characterized by significant gains and coincident interests by many or few actors.

The segmentation model contains four coopetition segments. To understand how they differ and relate to each other, the following five dimensions, derived from the coopetition literature, are used: political capital, interdependency, complexity, communication, and joint resource consumption. Below, each dimension is explained further.

- *Political capital* concerns the level of involvement that management invests in coopetition initiatives. This dimension is inspired by Dorn et al.'s (2016) work on balancing cooperation and competition and by Bengtsson and Raza-Ullah's (2016) focus on multifaced relationships.
- *Interdependency* covers how actors depend on each other in order to meet the objectives of coopetition initiatives. The source behind this dimension is Bengtsson and Raza-Ullah (2016) and their focus on dynamic coopetition relationships.
- *Complexity* denotes whether coopetition initiatives are complex in nature. Complexity can increase because of, for example, ambiguity, role conflicts, and risks (compare with Bengtsson and Raza-Ullah 2016).
- *Communication* refers to the need for communication about coopetition initiatives and whether the communication is internally or externally oriented. Dorn et al. (2016) recommended this dimension through their focus on enforcing communication among units.
- *Joint resource consumption* describes the extent to which coopetition initiatives draw on joint resources in order to succeed. This dimension proceeds from the work by Gnyawali and Park (2009).

To illustrate the four coopetition segments along these five dimensions, a study of coopetition was performed in the Triangle Region of Denmark, which is a polycentric and voluntarily formed business region of seven municipalities. These municipalities both cooperate and compete, and together, they have about 415,000 citizens and an annual budget of approximately 25 billion DKK. With the aim of setting an agenda among the municipalities, a secretariat plans and coordinates the different strategies on, for example, business development, culture, and infrastructure and reports to an execute committee including all seven mayors. Furthermore, this committee and the secretariat continuously consult with the city managers and business development managers from each of the municipalities in order to bring the strategies to life. In the following sections, examples of coopetition initiatives from the Triangle Region are linked to the four coopetition segments.

### Segment 1: Low Level of Cooperation and Low Level of Competition

Coopetition initiatives belonging to this segment are characterized by involvement and contribution from few actors as well as by restricted gains and coincident interests. In the Triangle Region, such initiatives relate to when some of the municipalities team up to provide, for example,

orthodontic treatment at schools, legal services in the city administrations, and sport events. Thus, the cooperation dimension relates to sharing resources and costs, whereas the dimension of competition relates to the rivalry in deciding which of the municipalities should work together. In the wake of this and the fact that coopetition initiatives in this segment rarely involve all seven municipalities, not many interdependencies exist, and joint resource consumption and complexity are low. Finally, such initiatives demand only little involvement from management, and they have primarily an internal stakeholder focus, indicating a low level of political capital investment and internal communication, respectively.

### Segment 2: Low Level of Cooperation and High Level of Competition

Coopetition initiatives that are linked to this segment are associated with involvement and contribution from few actors but with significant gains and coincident interests. In the context of the Triangle Region, such initiatives concern, for example, the attraction of citizens, public organizations, and firms to the region and its seven municipalities. The dimension of cooperation relates to when the municipalities jointly brand the region as a great place to live and work, whereas the competition dimension relates to when the municipalities compete against each other to gain the favor of the citizens, public organizations, and firms who have decided to settle in the region. Because of this clear division between cooperation and competition, coopetition initiatives in this segment have a medium level of complexity, and because of the joint branding, some interdependencies and joint resource consumption exist. Moreover, since these initiatives have significant gains and coincident interests and because they can determine elections and political careers, the political capital invested is high, and the communication is external.

### Segment 3: High Level of Cooperation and Low Level of Competition

Coopetition initiatives that fit this segment rely on involvement and contribution from many actors and have restricted gains and coincident interests. In the case of the Triangle Region, coopetition involves, for example, initiatives on producing a joint municipality plan for the entire region as well as establishing a joint fire brigade and energy supply. The cooperation dimension relates to when the municipalities pool their resources and align their interests for the common good of the region, whereas the dimension of competition relates to how many resources each municipality should contribute to the joint effort. To reach agreement on this matter, many interdependencies exist, along with a medium level of political capital, joint resource consumption, and complexity. Finally, initiatives of this kind have mostly an internal audience; therefore, the communication is primarily internally oriented.

### Segment 4: High Level of Cooperation and High Level of Competition

Coopetition initiatives in this segment are known for involvement and contribution from many actors as well as for significant gains and coincident interests. In the Triangle Region, the identification and selection of joint industry specializations are an example of such an initiative. The dimension of cooperation relates to identifying the specializations, whereas the dimension of competition relates to deciding which of the specializations to choose and support. Such coopetition initiatives contain many interdependencies and a high level of joint resource consumption because of the alignment and investments necessary across municipal boundaries. Moreover, because of the prestige of having a specialization linked to one's own municipality and because of contradicting municipal interests, both the level of political capital and complexity are high. Communication-wise, the focus is mainly internal, since the audience is primarily employees from the municipalities.

This illustration of the coopetition segmentation model has helped explore and further position coopetition in a public-sector context. As highlighted above, the four coopetition segments have a number of similarities and differences along the five theoretical dimensions of coopetition: political capital, interdependency,

**Coopetition in the Public Sector, Table 1** Characteristics of coopetition segments

| Dimensions/segments | I | II | III | IV |
|---|---|---|---|---|
| Political capital | Low | High | Medium | High |
| Interdependency | Low | Medium | High | High |
| Complexity | Low | Medium | Medium | High |
| Communication | Internal | External | Internal | Internal |
| Joint resource consumption | Low | Medium | Medium | High |

Source: Stentoft et al. (2018)

complexity, communication, and joint resource consumption. These parallels are displayed in Table 1.

As in Table 1, coopetition segments I and IV have reverse scores. This is due to the diverse levels of cooperation and competition in these segments. In between these two segments are segments II and III with a medium score on all dimensions except political capital in segment II and interdependency in segment III. Coopetition segment II scores high on political capital because of the prestige and competition related to the initiatives in this segment, and segment III scores high on interdependency because of the high level of cooperation and involvement of actors in the initiatives in this segment. Regarding communication, it is named either internal or external depending on the audience. If communication is labeled internal, it targets stakeholders such as politicians and employees in the public sector, and if it is labeled external, it targets stakeholders outside the public sector such as citizens, entrepreneurs, and firms.

## Conclusion

This entry explored and further positioned the concept of coopetition in a public-sector context. This has given birth to two major findings. First, it is emphasized that coopetition exists and is relevant in a public-sector context despite the lack of research so far on this matter. Second, the heterogeneity of public-sector coopetition is highlighted through the identification and description of four coopetition segments. Furthermore, the composed coopetition segmentation model is applicable for practice as a tool to prioritize coopetition initiatives, allocate resources, and become knowledgeable on how coopetition initiatives demand differentiated management approaches. Finally, to improve the segmentation model, it is of importance to assess it in other public-sector contexts, which will also address the entry's prime limitation – that it only builds on data from one business region.

# Coordination and Collaboration in Crisis Management

Allison Chatham
Department of Communication, University of Maryland- College Park, College Park, MD, USA

## Synonyms

Crisis management planning; Crisis management processes; International crisis management

## Definition

Coordination and collaboration in crisis management refer to the processes that occur when multiple parties work together in preparation for or in response to a crisis.

## Introduction

Effective crisis management involves the efforts of multiple parties working together to plan for, address, minimize, and stop a crisis. Crisis management planning has evolved significantly since the 1960s. The practice of crisis management is growing increasingly complex due to intensifying awareness of social conditions and natural disasters, the inclusion of more stakeholders in the process, and increasingly geographically dispersed teams. Response and planning networks have been strengthened through an increasing understanding and use of important social networks and communication channels with a focus on preventative planning and mitigation efforts rather than a singular focus on response. The use of collaborative networks strengthens crisis managers' capacities to successfully navigate crises.

Collaboration is, most simply, the act of working together on an activity. Coordination, however, refers to the process of adjusting expectations, aligning understanding, and identifying the scope of party contribution to increase the effectiveness of working together. Both collaboration and coordination are necessary for cohesive effectiveness. Before, during, and after a crisis, communication is the most important factor for coordinating and collaborating. The most effective teams (1) share an understanding of each member's strengths and weaknesses, dividing tasks accordingly; (2) have a shared understanding of priorities and member tendencies; and (3) have agreed upon decision-making and conflict resolution processes in place.

Coordination in crisis management is affected by team composition. Preplanned crisis management teams are more likely to have established processes and tools in place, while emergent groups work within more constraints to establish the best course of action. Emergent groups are unique because they are formed in response to a catalyst. They experience group cohesion and planning at a different rate than preplanned teams.

## Tools for Coordination and Collaboration

A crisis management team uses multiple tools in order to aid communication and task completion. Tools should be chosen based on ease of use as well as ability to contribute to team effectiveness. As a crisis management team grows larger or becomes more dispersed, it is more difficult to control member attention and to coordinate simultaneous meetings. A combination of tools and types should be used to ensure redundancy, accuracy, and information tracking.

The primary form of information sharing is verbal. Face-to-face interactions as well as phone, radio, or video interfaces facilitate the sending and receiving of timely information. When simultaneous, or near simultaneous, communication is not necessary or achievable, there must be secondary and tertiary tools to choose from.

Emergency Management Information Systems have been developed to synthesize and ease communications between decision-makers and responders. These systems aim to provide and support an infrastructure that has interoperability and continuity at multiple stakeholder levels and

by different agencies. Functions may include mapping, telephone and web alerts, remote or Internet-based access, document management, and streaming or stored visual output. These systems allow emergency managers to plan, execute, and track responses with other team members.

More static tools are used to aid knowledge sharing and learning before and after crises occur. Organizations commonly refer to emergency response plans (ERPs) or crisis management plans (CMPs) when deciding how to respond to unexpected situations. These plans can be printed and stored in physical locations or electronically accessed via intranets or websites. ERPs foster mutual understanding between various parties. These should be considered living documents that are updated and reviewed regularly.

Web tools, such as blogs, intranets, websites, and custom mobile phone applications, allow information to be stored (archived) and shared with a larger audience. These tools are also useful for communicating with external publics. Centralizing information and minimizing information gaps are more difficult as a group's size grows. These tools, when utilized correctly, minimize information gaps or spills. A crisis management team may rely on one or multiple coordinators to facilitate updating, distributing, and monitoring information via these media.

In 2007, the Virginia Polytechnic Institute and State University (USA) community learned of a gunman and shootings via a campus web alert. The alert and consequent updates were then shared on Facebook and Twitter. Since then, educational institutions have evaluated and refined their use of mobile and web alerts for the university community. Emergency updates share similar characteristics. They (1) identify a threat, (2) recommend a course of action, (3) are concise, and (4) are issued only by those granted authority by crisis management planners at the institution. Control over when and what messages are shared helps minimize misinformation.

Between 2008 and 2016, social justice movements have made noticeable uses of web tools to mobilize players, catalyze action, and document and share important information (i.e., social media use in the Arab Spring and the Black Lives Matter campaign). While access may not be fully controlled, information is shared that helps law enforcement, first responders, and other response groups identify potential areas of need or turmoil.

C

## Space and Coordination/Collaboration

Physical space has a number of implications for crisis management. While coordinating and collaborating, groups must consider potential natural barriers, such as geographic distance or impassable roads. Man-made inhibitors, such as meeting room size and office accessibility, are strong moderators of effective collaboration.

### Natural Space

The largest consideration in crisis management planning pertains to natural disasters. Natural disasters have the ability to spawn crises as well as inhibit crisis responses. During planning and response phases, consideration must be given to the impacts that natural disasters may have on team communication, movement, and technological access. Downed trees and impassable roads may impede the delivery of supplies or personnel to needed areas. Storms may also destroy phone and Internet connections making it harder to receive timely and accurate information between dispersed groups.

Geographically, dispersed teams must ensure their methods for sharing information in a timely manner. Redundant communication channels minimize disruption. Monitoring multiple channels also increases team ability to identify misinformation or inconsistent information. More monitoring does require more personnel. Time zone differences are especially important for crisis managers who are coordinating with nonlocal actors. Team member culture and energy are impacted because of working in different regions.

### Man-Made Space

A crisis may require the crisis management team, volunteers, or organizers, to meet at a predetermined location. These locations may be referred to as emergency operating centers

(EOCs) and can be located in an organization's headquarters or at various off-site locations. A crisis management team may decide to have one or more operating locations. There may be a central location, identified as a command center, and any number of satellite EOCs.

Off-site locations may be temporary or permanent and can range from movable trailers to hotel rooms or tents. Each location has a number of limitations that must be taken into consideration. These limitations include but are not limited to the maximum capacity of people the unit can hold, the maximum amount of essential equipment that the unit can hold, lighting, electronic connections, Internet connectivity, heating and cooling abilities and requirements, accessibility, and monetary costs.

## Problems in Inter-organizational Coordination and Collaboration

Communication has been identified as the number one problem that teams face; however, a number of other issues may interfere with effective collaboration when different organizations are involved. These issues include (1) misaligned goals, (2) mismatched skills, (3) emotional and social conflicts, and (4) a lack of trust between members. Teams who cannot adjust their expectations, align understanding, and develop trust risk decreasing their effectiveness. They also decrease their ability to complete a goal and increase the costs of participation. Organizational participation costs include time, money, personnel, and supplies and may also involve social, political, and legal implications. Actor participation costs include time, money, and physical, social, emotional, and mental energies. Team managers should address the triggers for these potential problems early in the collaboration and coordination process. These areas should also be regularly reviewed and evaluated.

## Government Roles

Planned crisis management teams (CMTs) are composed of individuals with specialized skills and knowledge. Before crises occur, these teams should meet to evaluate risks, establish expectations, and practice decision-making and response strategies. In numerous countries, the national government is held responsible for response to crises and disasters. The government is often a key player in the establishment and maintenance of organizational alliances focused on crisis management because it has social, political, and legal powers and financial resources that singular organizations and agencies do not have access to.

Internationally, governments are at different developmental stages in crisis management. International treaties, alliances, and frameworks support the development of more cohesive and effective planning and have been adopted in some form on almost every continent. Mutual aid agreements also play a large role in the development of strong network bonds between local and nonlocal governments. Mutual aid agreements allow personnel, supplies, and equipment to be shared outside of their normal jurisdiction in response to a crisis.

CMTs should regularly meet to plan and review their plans. Executing practice plans and drills helps create mutual understanding and trust between team members and presents opportunities to identify and correct weaknesses. Nationally and internationally, teams meet regularly to review their roles. These teams are often identified as committees. Committee members can be from public and private sectors. Each committee oversees specific crisis management functions.

### North America

In the United States of America, the Federal Emergency Management Agency (FEMA) is responsible for oversight of national coordination. FEMA was established in 1979. Prior to this, state and local agencies were assisted by the federal government through individual pieces of legislation in response to specific disasters. In 2003, FEMA merged with 22 other agencies to form the Department of Homeland Security. In 2006, FEMA was reorganized via the passing of the Post-Katrina Emergency Reform Act. This act expanded FEMA's preparedness mission and addressed and developed guidelines to support

individuals with disabilities, survivors of major disasters, and the reunification of separated family members.

At a local level, planned efforts may come through organization of smaller networks of people and organizations. Voluntary Organizations Active in Disaster (VOADs) and Community Organizations Active in Disasters (COADs) are comprised of nongovernmental organizations that significantly contribute to during and post-disaster efforts. While there is a national VOAD, a state's Office of Emergency Management (OEM) is often responsible for overseeing and liaising with members of local VOADs and COADs. State emergency response plans often account for existing agreements with VOADS and COADS to provide services, space, or supplies after disasters.

The Hyogo Framework for Action (HFA) has encouraged the development and improvement of crisis management systems around the world. The HFA was established in 2005 at the World Conference on Disaster Risk Reduction. Its main goal was to reduce vulnerabilities to natural disasters through the creation of policy, legislation, and national structures. In 2015, the Sendai Framework for Disaster Risk Reduction, HFA's successor, was created to focus on the development of more comprehensive plans that integrate and address the various aspects of citizens' lives (social, cultural, technological, educational, political, legal, health, etc.). Central American and Caribbean countries have participated in HFA.

In the Caribbean, plans have been activated through the Caribbean Development Bank and the Caribbean Disaster Emergency Management Agency (CDEMA). In 1991, the Caribbean Disaster Emergency Response Agency (CDERA) was established to head response and relief efforts in participating states. In 2009, the agency was transformed into the CDEMA. CDEMA's responsibilities include response and relief efforts as well as information management, the development and implementation of mitigation strategies, and facilitation of governmental and nongovernmental agency coordination and cooperation. Members of CDEMA include Anguilla, Antigua and Barbuda, Bahamas, Barbados, Belize, British Virgin Islands, Dominica, Grenada, Guyana, Haiti, Jamaica, Montserrat, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, Trinidad and Tobago, and the Turks and Caicos Islands.

Dominica established emergency response authorities in 1951 through the passing of the Emergency Powers Act. However, a more cohesive national disaster plan was not created until 1988. Dominica's National Emergency Planning Organization (NEPO) committee is composed of governmental officials and staff, for-profit organizational members, and nongovernmental organizational members. NEPO operates the Office for Disaster Management (ODM). The Dominica ODM has established a central location and satellite supply storage facilities around the island. Dominica's response preparedness plans are actively reviewed; however, they lack planning and execution in critical areas such as public education. The country also suffers from severe physical limitations due to size and topography.

In Haiti, the National Disaster and Risk Management System (SNGRD) was established in 2001. The SNGRD is composed of Departmental Disaster Risk management Committees, as well as municipal committees. However, these committees lack the legal and technical abilities to execute their roles. Overall, the SNGRD struggles as an organization functioning in an unstable political and economic climate. It prioritizes multilevel and multi-stakeholder responses nationally and internationally; however, there are not enough legal and financial resources to plan and execute basic crisis management at all levels of the system. The SNGRD has established an efficient messaging system that targets vulnerable populations and focuses on awareness and education.

In St. Kitts and Nevis, the National Emergency Management Agency (NEMA) oversees response and planning. NEMA was established in 1995 and was further strengthened by the Disaster Management Act of 1998. NEMA operates the National Disaster Committee (NDC), which is composed of governmental officials and staff, for-profit organizational members, and nongovernmental organizational members. NEMA also works with

Disaster District Committees and various subcommittees. NEMA operates out of a central office facility, but has not established satellite facilities on the islands. NEMA actively promotes public education media and workshops.

### South America

In Central America, countries have established emergency management systems through participation in the Central American Coordination Center for the Prevention of Natural Disasters (CEPREDENAC). CEPREDENAC was established in 1987. Current members include Costa Rica, El Salvador, Honduras, Guatemala, Nicaragua, and Panama.

In Costa Rica, the National Risk Prevention and Emergency Management Commission is responsible for national coordination during an emergency. In 1969, the National Emergency Commission (NEC) was established. It was primarily responsible for overseeing the National Emergency Fund. In 1999, and then 2006, the Commission's responsibilities were expanded to include the development of more comprehensive and integrated emergency response plans.

### Asia

In India, the 2005 Disaster Management Act spurred a transition in the government's coordination structure. In the newest iteration, the National Disaster Management Authority, State Disaster Management Authority, and District Disaster Management Authorities have financial and administrative powers. Training, capacity building, and documentation are the responsibility of a separate agency – the National Institute of Disaster Management. Prior to 2002, individual crisis management groups (national, state, and district) reported to the National Crisis Management Committee, but were majorly responsible for crisis response.

In the Russian Federation, crisis management is executed through the State System of Preventing and Eliminating Emergency Situations (RSES). RSES was established in 1992 and operates at federal, regional, territorial, and local levels. There are more than 40 subsystems operating within these levels. The coordination of these systems, at the territorial level, is executed by regional centers of the Ministry of Emergencies of Russia. RSES also operates as the Russian Federation's international relations arm concerning emergencies and disasters. In 2006, the Ministry of Russian Federation for Civil Defense, Emergencies and Elimination of Consequences of Natural Disasters (EMERCOM) was established to oversee policy. EMERCOM also oversees the National Crisis Management Center which oversees information channels, interdepartmental cooperation, and emergency monitoring.

In China, the China National Committee for Disaster Reduction (NCDR) is the newest iteration of the 1989 China National Commission for the International Decade on Natural Disaster Reduction. The NCDR is responsible for establishing policy and mitigation action plans as well as facilitating international collaboration. It is composed of 34 separate ministries and bureaus. In 2008, the National Disaster Reduction Center of China (NDRCC) and the Ministry of Civil Affairs (MCA) developed the National Disaster Information Management System (NDIMS). Twenty-two provinces have reserve facilities with supplies. The government has also used the HFA (Hyogo Framework for Action) as a basis to develop a more aggressive public education plan.

## Citizen Roles

Unplanned crisis management teams usually manifest as volunteer groups and community organizations created in response to a crisis. These groups develop similarly to planned CMTs; however, their main concern is collaboration: working together on specific projects and tasks to address an immediate concern. Emergent groups face higher project risks than planned groups. These actors must be more conscious of their impact in large-scale crises. Nonlocal groups, who relocate to help rebuild or provide support after crises, need to evaluate whether their presence and work are burdens on local resources (i.e., food, space) or personnel (i.e., first responders and law enforcement). However, any of these emergent groups may play a significant

role in maintaining and rebuilding communities after crises.

Emergent groups may be more fluid and able to respond quicker to developments than planned groups. Factors include (1) group size, emergent groups may be less diverse and have fewer numbers; (2) lack of static emergency systems and operating procedures; and (3) different decision-making structures. These groups may also operate independently and not report to local law enforcement or first responders. Finally, citizen groups may work together and share resources but have different end goals that do not require the same cohesiveness for effectiveness that planned groups do.

## Conclusion

The coordination of multiple organizations for effective crisis management is becoming increasingly important. Recent crisis management planning has recognized the need for, and begun to make use of complex networks and alliances to strengthen the team's ability to mitigate, respond to, and learn from crises. Preplanning for these teams requires an understanding of roles, tools, and space available. Indications of struggling teams include increased participation costs for actors and organizations, social and emotional conflicts between actors, and a lack of efficiency or effectiveness.

Internationally, governments have attempted to address these potential deficiencies through the use of committees and information management systems. Committees have areas of specialization and work to oversee the development and execution of strategies specific to their area. Each country has established its own priorities, often based on geographic, social, political, and economic constraints. Many countries have been impacted by international alliances and mutual aid agreements.

Local responses to coordination are more heavily impacted by emergent response groups and volunteers. There are likely fewer systems and structures in place to monitor the work of emergent groups. These teams are more likely to have high social and economic impacts where the government has more structural impact.

# Coordination and Effective Governance

Mst Marzina Begum and Md Nurul Momen
Department of Public Administration, University of Rajshahi, Rajshahi, Bangladesh

## Synonyms

Coordination; Government; Horizontal; Organization; Vertical

## Definition

Coordination is defined as the purposeful alignment of units, roles, responsibilities, and efforts in order to attain a common goal (Christensen and LÆgreid 2018).

Coordination is about adjusting the actions and decisions of an organization to achieve targeted goals (Koop and Lodge 2014).

## Introduction

Coordination is a major issue for the effectiveness of any organization, which is required at all stages of public policy or the activities in organization. Coordination also supports coherent acts that have become a major governance challenge across the world. In the contemporary context of public policy, the diversity of stakeholders is involved in the decision-making process or any policy actions; therefore, it is the synchronized actions of the government that determine the coherence acts and support the policy agenda of the government (Tamtik 2016). However, designing public policy or any action increasingly connects diversity of stakeholders, and territorial decentralization in terms of regionalization, and multiple sources of funding leading to differentiation in organizational capacities and responsibilities (Edler and Kuhlmann 2008; Nilsson and Moodysson 2015). Given the importance of coordination in organization, Boston (1992) defines it as a dynamic process that facilitates the process of organizational activities and avoids overlapping and inconsistencies in policy and directions. He further added that coordination promotes to take coherent actions for minimizing the conflicting interests among the stakeholder in the policy process (Jennings and Crane 1994; Seidman 1999). However, coordination has always been a problem in the public sector in the world. It is of worthy to note that in the past several decades, there have been significant reform initiatives in the public sector and almost all governments across the world have undertaken a variety of strategies in the process in which they implement policies or actions (Bouckaert and Pollitt 2004). However, the entry is to conceptualize coordination and to re-examine its role for effective governance in organization.

## The Concept of Coordination

Marume and Jaricha (2016) present coordination as the synchronization of efforts, but conceptualize it from both positive and negative perspectives. On a positive note, it means bringing about cooperation and teamwork among the persons and units of an organization. But in negative terms, it means removing conflicts, values, inconsistencies, overlapping, and working at cross-purposes among persons or units of an organization. Hence, the above conceptualization with respect to coordination makes it clear that coordination is much more than cooperation of one person with another or others toward a common goal (Marume and Jaricha 2016).

## Typologies of Coordination

Coordination in organization is classified as "internal and external." Internal coordination deals with coordinating the individual activities of persons and units of an organization which is called as functional coordination. External coordination deals with coordinating the activities of various organizational units, which is called as structural coordination (Marume and Jaricha 2016).

### Horizontal and Vertical

Horizontal coordination deals with the coordination between one unit and another, one branch and another, one division and another, or one department and another. On the other hand, vertical coordination deals with the coordination between an executive and his supporting staff, a branch and a division, and a division and department (Marume and Jaricha 2016).

### Procedural and Substantive

Procedural coordination is operationalized as the structure of the organization itself that shows the nature of formal relationships among its members. The substantive coordination, on the other hand, is concerned with the content of the activities of the organization (Marume and Jaricha 2016).

## Importance

Coordination is essential for smooth and successful functioning of any organization. It is important in all aspects of organizational activities. Fayol, Gullick, and Urwick are some notable public administration scholars who have argued for coordination as an important principle

of organization. Gullick and Urwick in their paper in 1937 on administrative management theory developed POSDCORB in a very practical way, which stands for Planning, Organizing, Staffing, Directing, Coordinating, Reporting, and Budgeting. Gullick and Urwick (1937), in case of planning and organizing, point out what to include in a good plan and how to successfully implement it in organization. It is also important in case of staffing, as it indicates who should be the right staff and at the appropriate place as well. Even coordination highlights on directing, because it indicates to a specific focus in organization. Coordination helps coordinating the tasks of organization. When it is talked about reporting of organization, it produces realistic and coordinated information received from all sections or groups. Finally, coordination is part of budgeting, because it gives organization a good appraisal (Marume and Jaricha 2016). However, in general, coordination avoids conflicting interests and duplication of work for the functioning of any organization (Marume and Jaricha 2016).

## Techniques

However, to say that, there are different techniques of coordination, such as planning as an important means of coordination; institutional or organizational arrangement, such as inter- or intradepartmental meetings, planning among persons and units of organization, and so on; and standardization of procedures and methods like forms, manuals, regulations, verbal and written communications among the staff or units, organizational hierarchy, or scalar chain which constitutes the universal process of coordination; in addition to the above formal means, there are some other informal means of coordination, such as personal contacts (Marume and Jaricha 2016).

## Search for Coordination

Keeping the importance of coordination in organization in mind, theories regarding coordination have been developed from time to time in variety of discipline or field to coordinate the functioning between components and objects. It is stressed that organizational issues and concepts are brought into the existing theories with respect to coordination. Emile Durkheim, a great sociologist, has explored the negative outcome due to lack of definite purposes or specified goals in a condition of complex social environment. Hence, what is needed for an individual or a unit is reciprocation and purposive cooperation for attaining collective goals for organization. In the past decades, there have been deconcentrated decisions with respect to power of the central governments; the reforms have been made to decentralize power among the different levels of government. All of these changes have been made for the sake of decentralizing power to the lower levels of the government that have had the effect of diminishing power at the political and administrative center of the state. Furthermore, the logic behind the control of the public organization has been shifted from hierarchy and move toward competition with private sector.

When it is talked about different forms of coordination, there are two forms, such as vertical organizational structure and horizontal organizational structure. The structure of vertical organization is characterized in a more hierarchical manner, because of the power relationship that flows from top to bottom. On the other hand, the structure of horizontal organization is focused on specialization and participation, where the structure of horizontal organization becomes decentralized, flat, and, flexible. It is to be noted that in horizontal organization, employees may exercise more responsibilities for their tasks (Ronen et al. 2007). However, irrespective of the nature of an organization, coordination is necessary on the ground that it helps to arriving at the most appropriate decision for an organization that can have good internal and power-sharing approach or always intend to reestablish their power and influence for any kind of political initiatives (Peters 2000). Despite the fact still an increasing number of political leaders in the center of government and administrative systems continue to highlight on the efforts of decentralization process.

However, there are different strategies in order to cope with decentered government. Most importantly, it needs to highlight the role of political

executive at the top of government, so that common ideals and framework can be shared to steer policy and programs. However, what we learnt from the past experience with respect to decentered forms of government is that there are too many competing ideas and values; therefore, coherent policy and direction cannot be easily attained. To overcome the challenges of competing values, a clear central ideas and guidelines are needed to avoid overlapping and confusion that arising out from decentralizing roles and responsibilities of the political executive at the center.

For an effective coordination in organization, a clear definition must be stressed with respect to roles and responsibilities and structure of personnel. The very fact is that in modern world organizations are, in general, quite large and complex; therefore, it needs to emphasize on process dynamics. Provis (2004) pointed out that no collective goal can easily be achieved without a good quality of mutual reciprocation and coordination; the logic behind it that improved performance in organization can be attained with reciprocation among the appropriate stakeholders. However, it is pointed out that coordination intends to find an answer to the type of explorative questions with respect to why, how, when, and who of organization.

The State Service Commission of New Zealand ( 2013) has mentioned a number of challenging issues about coordination in an organization, such as longer stages of decision-making processes and direct and indirect costs of maintaining management and employee for introducing joint working approaches and structure. Despite the disadvantages, enumerated by the State Service Commission of New Zealand (2013), the benefits of coordination in an organization surpass the disadvantages; it is highlighted that most of the challenges regarding coordination highlighted in the commission can easily be turned into advantages with a positive thinking toward the roles of coordination in organization.

Against the backdrop, Christensen and Lægreid (2007) opined that the logic behind the introduction of New Public Management (NPM) has highly been concentrated through the strategy of fragmentation in approach; this movement also highlights to enhancing efficiency and transparency in public organization, with a view to making roles and responsibilities less ambiguous. Christensen and Lægreid (2007) have argued that vertical specialization or structural devolution undermines the control of political executive from the center, which diminishes the influence of political executives over the subordinate or regional levels of government. On the other hand, Christensen and Lægreid (2007) have argued that increased horizontal specialization, based on the principle of "single purpose organizations," has produced challenges of organizational capacity and coordination.

However, when it is discussed about reform efforts of the post-NPM model, vertical and horizontal structure of coordination have changed the earlier paradigm of the NPM. Post-NPM focused on the approach of "whole of government" and "joined up government" (Christensen and LÆgreid 2007). Under the vertical form, directing and controlling more central resources toward subordinate level of government became increasingly dominant values for political executives to regain political control at the center and achieve coherent policies and its implementation across the different levels of government. Under the horizontal form, measures like central government agencies were increasingly being used to deal with the "siloization" or "pillarization" of the public sector (Christensen and LÆgreid 2007) (Table 1).

**Coordination and Effective Governance, Table 1** Different forms of coordination

| | Horizontal coordination | Vertical coordination |
|---|---|---|
| Internal coordination | Intra-level coordination between ministries, agencies, or policy sectors | Inter-level coordination between parent ministry, and subordinate agencies and bodies |
| External coordination | Coordination with civil society organizations/ private sector interest organizations | Coordination<br>(a) Upward to international organizations<br>(b) Downward to local government |

## Role of Coordination for Effective Governance

Coordination is very important for promoting good governance practices and ensuring successful implementation of any development projects and programs. Coordination, generally, refers to an interactive process of communication and decision-making among different units or agencies. As already stated, it is for the purpose of synchronization of efforts which align actions and capacity with a view to achieving a common collective goal. Coordination between public agencies, on the one hand, and designing plan and financial authorities, on the other, have often been a major stumbling block for development policy and programs across the world. However, many developing countries in the world have introduced national strategies for their development efforts; however, there are doubts whether these strategies maintain policy coherence in promoting their development goals. Given the context, it is stressed that national development strategies and plans must be aligned within a coherent public financial management framework; in this regard it needs to establish coordination between policy and action within the framework of public financial management.

It is very important to note that a proper coordination among public organizations is required at the national level that may bring positive outcomes, thereby facilitating progress toward the successful implementation of development policy and programs. It is stressed that effective coordination starts with the performance of line ministries or through street-level bureaucrats. For instance, Bangladesh has been progressed to fulfill their goals for reducing infant mortality rate and improving the conditions of maternal health through successful implementation of a National Health Policy. This success of Bangladesh has been possible due to enhanced coordination and the concerted efforts and collaboration among the Planning Commission, the Ministry of Health and Family Welfare, and the Ministry of Women and Children Affairs. On the other hand, coordination with other responsible actors beyond the central government is highly emphasized in governance process, for instance, the success of Brazil's Bolsa Família program, where it is partly attributed to the capacity of strong leadership (Pereira 2015); it is of worthy to note that in case of Bolsa Família program, effective coordination between the national government and municipal authorities acted an important role. To uncover the fact, it is found that the Ministry of Social Development of Brazil made a formal joint management agreements and collaborative strategy with each municipality authorities of the country to clarify their roles and responsibilities in order to maintain standards for successful implementation. For enhanced coordination, as a strategy, the program introduced performance-based financial benefits to the concerned municipal authorities who were involved in implementing the program.

Efforts are always made to achieve policy coordination and coherence, but there is the number of constrained factors, such as poor performance of organizations with respect to public service delivery. The poor performance in delivering public services arising out from weak human skills and poor performance of institutions plays a critical role, when it comes to designing and implementing development policy and programs. Furthermore, it is of worthy to note that public service delivery is also negatively affected by some other factors, for instance, most importantly, low allocation or slow progress of implementation regarding the development budgets in many developing countries, where governments are failed to fully spend their allocated public expenditure within the specified period of time. Having cited an example, in an empirical study on 118 countries, it is found that countries with small populations, with special reference to the Small Island Developing States (SIDS) in the Pacific, face serious difficulties with respect to human and technical capacity for effective management of public finance (Haque et al. 2012).

Bardach (1998) has argued that collaboration is required for achieving strengthened coordination among stakeholders who are involved in designing policy or actions in ways that support the capacity of organizations. Collaboration among the appropriate stakeholders in organization may cooperate and further produce strategic solutions to complex organizational problems.

This strategy of collaborative approach fosters meaningful coordination that can be achieved only through developing a common collective goal among the appropriate stakeholders in the process; however the collective goal must be in place that enables all the relevant stakeholders to feel and share that they are achieving or going to achieve something in future through the efforts of mutual cooperation and reciprocation (Bardach 1998).

## Conclusion

From the above discussion, it can be said that coordination is the synchronization of efforts to enhancing effective coordination in organization. Hence, an effective coordination structure must be placed as a building block for the implementation of development policy and programs. Having reviewed the different literature, it can be concluded that coordination leads to better organizational performance that provides every nature of advantage to an organization. However, from internal perspective of coordination, personnel and tools of organization should be structured for the purpose of producing positive outcomes, on the other hand, from external perspective; organization must be in place of realizing internal arrangement even with the presence of other competing organizations.

# Coordination Between Municipalities in Crisis Management

Chad S. Foster
College of Justice and Safety, Eastern Kentucky University, Richmond, KY, USA

## Key Terms and Definitions

- Coordination – The harmonization of activities among diverse actors in emergency management with the purpose of overcoming the challenges inherent in disasters.
- Disaster – An event that exceeds the emergency response and recovery capabilities and resources of the agencies and officials responsible for its management in one or more critical areas of response or recovery.
- Emergency Management Assistance Compact – A national disaster interstate compact ratified and signed into law by the U. S. Congress in 1996 that supports the efficient and effective sharing of resources to states.
- Fragmented Government Responsibility – The federal system of layers of government tends to fragment responsibility for disaster management with significant authority residing at the state and local governmental levels.
- Regional Coordination – The use of government resources in a complementary way toward goals and objectives that are mutually agreed upon by various stakeholders in the region.
- Robert T. Stafford Disaster Relief and Emergency Act – The Stafford Act authorizes the president to provide major disaster and emergency declarations to states for events in the United States that overwhelm state and local capability, upon request by a governor.
- Tiered Response – Incidents are managed at the lowest possible jurisdictional level and supported by additional response capabilities when needed.

## Introduction

Wildfires present many challenges to authorities responsible for fire suppression in California and other Western states. For one, wildfires show little concern for jurisdictional boundaries. The 2015 Valley Fire, for example, devastated 76,067 acres across the Lake, Napa, and Sonoma counties, and is considered the third most devastating wildfire in California's history (State of California 2015; Joyce 2015).

According to McEntire (2015), "coordination is the harmonization of activities among diverse actors in emergency management with the purpose of overcoming the challenges inherent in disasters" (p. 308). Conceptually, disasters are unique, especially when compared to other more routine incidents such as emergencies or crises. Specifically, the response requirements associated with disasters often exceed the capabilities of local emergency services (Haddow et al. 2014, p. 31). Wildfires such as the Valley Fire are often classified as disasters and demand significant coordination among fire service agencies, law enforcement agencies responsible for evacuating residents, medical facilities responsible for caring for those injured, human service agencies responsible for sheltering residents, and a host of other public, private, and nonprofit organizations with important roles in disaster management.

The need for cross-jurisdictional coordination during disasters, as difficult as it may be, is a symptom of the unique intergovernmental relationships that exist in the United States. Specifically, the 10th Amendment to the US Constitution notes that "[t]he powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States," which includes "police powers" (National Emergency Management Agency [NEMA] 2011, p. 14). In fact, there is no reference to Federal government involvement in disaster assistance in the US Constitution. Generally, states and local governments are presumed responsible for disaster management.

Some exceptions to this intergovernmental framework exist. For example, disasters on federal lands (e.g., National Parks, Monuments, etc.) may

be the responsibility of federal agencies such as the US Department of Interior or US Forest Service, an agency of the US Department of Agriculture. The US Coast Guard and US Environmental Protection Agency may have responsibility for management of incidents on waterways such as oil spills. Likewise, the Federal Bureau of Investigation will exercise broad authority for managing disasters linked to acts of terrorism.

However, a majority of disasters occur within the geopolitical boundaries of the 50 states, the District of Columbia, US Territories, and Commonwealths, as well as among the approximately 3141 counties and 36,000 sub-county general-purpose governments within the states. As a result, disaster management approaches and practices may be characterized as decentralized and fragmented, both horizontally and vertically, across the country (Sylves 2015).

And, significant variation likely exists from state to state. According to recent US Census Bureau estimates, for example, both Arizona and Indiana have similar population sizes or 6,828,065 and 6,619,680, respectively. However, Arizona's land size of 113,990 square miles is more than three times the size of Indiana, which is 36,420 square miles (see U.S. Census Bureau 2015a, b). The US Census Bureau also publishes statistics on the number and type of local governments that have general and special jurisdiction by state; see the Table 1 below.

Despite having similar population sizes, one may infer that Indiana is a much more fragmented state when compared to Arizona, generally speaking. Not only are local units of government highly fragmented in many states, but states grant different levels of autonomy to their local units (Richardson et al. 2003). These structural factors may impact the ability of local units of government to manage disasters.

Likewise, the nation's systems and traditions also support local control and decision-making for mitigating, preparing for, responding to, and recovering from disasters. Mitigation strategies and recovery planning, for example, may involve updating state and local building codes that govern construction standards or land use planning laws and ordinances (e.g., zoning, subdivision controls). State and local units may use financial tools such as taxes, impact fees, etc. as disincentives for building in high-risk areas.

Likewise, contemporary response doctrine embraces the concept of the tiered response; this means that incidents must be managed at the lowest possible jurisdictional level and supported by additional response capabilities when needed (U.S. Department of Homeland Security [DHS] 2013). This doctrine is supported by the Robert T. Stafford Disaster Relief and Emergency Act, which was signed into law in 1988 and amended numerous times since then. This seminal law aims "to provide an orderly and continuing means of assistance by the Federal Government to State and local governments in carrying out their responsibilities to alleviate the suffering and damage which result from such disasters. . ." (Robert T. Stafford Disaster Relief and Emergency Assistance Act of 1988).

In other words and in summary, a premium is placed on the idea of coordination in the United States given that national disaster laws and policies favor local control and decision making, but rarely do disasters occur precisely within the boundaries of state and local jurisdictions.

## Benefits and Challenges

Understanding context is important when evaluating disaster management policies and practices,

**Coordination Between Municipalities in Crisis Management, Table 1** Number of local governments by State (U.S. Census Bureau 2012)

| State | County | Municipality | Town or Township | Special district | School district | Total |
|---|---|---|---|---|---|---|
| Arizona | 15 | 91 | N/A | 326 | 242 | 674 |
| Indiana | 91 | 569 | 1006 | 752 | 291 | 2709 |

especially in a comparative manner at the international level. The United States is a geographically expansive country; many states themselves rival foreign nations in size and population. For example, the most populous state, California, by itself ranks in the top 10 when compared to countries globally according to some economic measures such as Gross Domestic Product (GDP) (Sisney and Garosi 2015).

Regardless, decentralizing disaster management does carry many benefits in the United States. For example, approaches and solutions may be tailored to the unique hazards and threats and characteristics of communities. Communities in an earthquake-prone area of California have the flexibility to design public awareness campaigns aimed at their residents and visitors, while communities in the northeastern portion of the country may emphasis preparations for wintry weather. Second, decentralizing disaster management supports the timely response to incidents as state and local chief executives have broad authority to make decisions and deploy resources to save lives and protect property. Third, diverse practices nationwide likely supports innovations for addressing problems that may be first tested or piloted at the local scale. This may be especially useful when adopting technologies for alerting and warning residents, for example.

On the other hand, decentralization and fragmentation may also lead to the following challenges:

- Inconsistent practices nationwide that makes integration difficult during large-scale incidents.
- "Stovepipe" environments characterized by a lack of interoperability and compatibility among system components such as communications equipment.
- Inadequate preparations resulting from a lack of resources and preparations conducted within the confines of geopolitical boundaries and not at scales more appropriate for responding to large-scale disasters.

Beyond the problems associated with equipment compatibility, disasters present unique conditions or factors that are inherently difficult for people to overcome through coordination and other means. For example, McEntire (2015) notes the following conditions or factors:

- Disasters require that people conduct unfamiliar tasks, may change the structure of responding organizations, and mobilize participants who do not customarily respond to local emergencies.
- Disasters may require deviating from normal procedures and require flexibility and improvisation.
- The political values and organizational cultures of participating groups may differ, and these groups may have a tendency to compete for resources and recognition at the expense of outcomes and achieving shared goals.
- There may be a lack of communication among responding groups and a lack of sufficient, complete, or accurate information may hinder coordination (p. 310).

Exploring normative political theories as identified by Sylves (2015, pp. 28–31) may also be useful for exploring coordination challenges among disaster participants. The Hamiltonian Model, named for Alexander Hamilton's public management style, assumes that the public manager possesses specialized knowledge and expertise not possessed by others, and making decisions based on one's unique knowledge, skills, and abilities is acceptable. This model supports a top-down model in which a select few make decisions during disasters. For example, firefighters and police officers are often forced to make split-second decisions to save lives and protect property on a daily basis.

The Jeffersonian Model, on the other hand, is named for Thomas Jefferson's public management style. This model places a premium on community participation in decision-making and the skills of consultation, negotiation, and communication. According to the Jeffersonian Model, the process for arriving at decisions is valued.

The Jeffersonian Model may be more conducive to situations in which people need to work together to solve complex problems, and the public is viewed as a resource. Conversely, the Hamiltonian Model may be a necessity in many situations, such as when responding to the accidental release

of a hazardous material, and local units possess specialized knowledge and equipment for responding. Participants in disaster management come from a variety of traditions, including those consistent with the Hamiltonian and Jeffersonian Models, which may either facilitate or exacerbate the coordination believed necessary for making decisions and overcoming challenges.

## Alternatives for Improving Coordination

This section presents a few alternatives available for enhancing coordination for disaster management purposes and overcoming the challenges noted in the previous section.

### Regional Approaches and Compacts

From an economic perspective, O'Sullivan (2009) suggests that the provision of local goods may be inefficient if externalities are large from a geographic perspective, and scale economies are large. Furthermore, he offers subsidies from higher levels of government and the transfer of local authority to metropolitan-wide governmental entities as two possible responses to address inefficiencies in the provision of goods and services. Consistent with this economic reasoning and since 2001, DHS and other federal departments and agencies responsible for providing grants to states and local communities have consistently used financial incentives to encourage regional approaches. These approaches are viewed as one form of rescaling to address intergovernmental issues, among others.

Well before 2001, many cities themselves developed regional councils to support planning and coordination in various policy areas. Beginning in the 1960s, for example, federally designated Metropolitan Planning Organizations (MPOs) began planning surface transportation across metropolitan regions (Miller 2002, p. 103). In the decades to follow, many states such as Texas passed laws to permit regional planning commissions and regional councils of government to support planning and coordination in many public policy areas such as disaster management (Texas Local Government Code n.d.). The National Capital Region may be the only region to derive authority from federal law; the Homeland Security Act of 2002 and Title 10 of the United States Code define the NCR's geographic area and membership (Homeland Security Act of 2002).

Conceptually, regions generally refer to multijurisdictional areas that unite public officials to address common problems, identify communities of interest, and improve the quality and delivery of public services. While some states and localities are accustomed to coordinating regionally, such as those that comprise the National Capital Region, others are not. Unfortunately, response agencies at the local level tend to conduct preparations for large-scale disasters within the confines of their geopolitical boundaries. This may suffice for responding to small-scale incidents, but not large-scale disasters that commonly impact areas well beyond traditional state and local boundaries as the Gulf Coast experienced in 2005 following the landfall of Hurricane Katrina.

Among other possible methods, coordination is an integral activity in achieving enhanced preparedness. In September 2004, the Government Accountability Office issued a report outlining several factors that characterize effective coordination. The GAO (2004) defined regional coordination as "[t]he use of government resources in a complementary way toward goals and objectives that are mutually agreed upon by various stakeholders in the region" (p. 8). A prerequisite for effective regional coordination, however, is that local government units within the region achieve high levels of preparedness themselves. In other words, the coordination of resources cannot take place at the regional level unless those resources are known and organized at the local level. The coordination that takes place on the regional level is often centered on sharing resources and information.

Multijurisdictional response and recovery operations require the sharing of personnel, equipment, and facilities in an almost seamless fashion. Therefore, many regional planning and coordination efforts focus on developing or improving policies that govern the use of these resources.

Similarly, enhanced information sharing across jurisdictional boundaries leads to improved situational awareness and, therefore, decision-making. Regional efforts also help transfer best practices and professional experiences, increasing overall preparedness.

Regional approaches may be formalized through compacts, memorandums of agreements, and executive orders commonly adopted by chief executives. One of the most well-known interstate compacts to support the coordination of resources across state lines is the Emergency Management Assistance Compact (EMAC). In 1996, Congress passed the Public Law 104–321, which authorized states to "provide for mutual assistance between the states entering into this compact in managing any emergency disaster" (Joint Resolution 1996). In passing the EMAC law, states were provided flexibility in helping each other during disasters while also complying with minimum legal requirements identified in the compact relating to compensation, reimbursement, immunity, and other provisions. Since 1996, all states have enacted EMAC legislation. After Hurricane Katrina, nearly 66,000 personnel mobilized to help in the response and recovery from the disaster along the Gulf of Mexico (NEMA 2014). Without the help of EMAC, Louisiana may not have been able to gain the help from as many states as they did.

As a means to support coordination, it is not expected that compacts would involve significant restructuring of local boundaries if implemented at the local scale. While the compact itself ensures a minimum level of vertical and horizontal governmental integration, the structure of the regional authority and type of coordination promoted in the compact toward achieving shared goals is equally important. Theoretically, compacts might be used to authorize and finance many different forms of interstate and interlocal coordination. These may include generally easy to implement planning to the formation of regional institutions that may have authority "over public agencies and indirectly over private regional actors" (Walker 1987).

### Professionalization and Doctrine

Coordination among disaster participants may be improved via the use of professional training and by modifying the competencies expected of decision makers. There is a gap in knowledge, skills, and abilities associated with disaster coordination if participants are not experiencing large-scale disasters on a frequent basis or learning and reinforcing those knowledge, skills, and abilities through other education and professional training venues.

In lieu of disasters, real-world exercises may simulate the conditions that require participants to coordinate with one another. In addition to formal mechanisms such as exercises, McEntire (2015) promotes the use of informal methods of connecting participants with one another and networking before a disaster; these methods help participants identify and understand cultural differences that may exist.

National associations of professionals and organizations responsible for promulgating standards have a role in supporting coordination. The National Emergency Management Association (NEMA), which currently administers EMAC and the Emergency Management Accreditation Program (EMAP), and the International Association of Emergency Managers (IAEM) may help steer resources to areas of disaster management that may result in standardization and, ultimately, improve coordination. For example, standardizing platforms used for displaying geospatial data or the data elements used by disparate commercial platforms would likely support coordination.

Given that the Federal government fulfills important roles in providing training, technical assistance, and grants to state and local officials, national doctrine may have an impact on supporting many of the aforementioned alternatives. A case in point is the following FEMA doctrine: *A Whole Community Approach to Emergency Management: Principles, Themes, and Pathways for Action* (FEMA 2011). Though empirical data is lacking, anecdotal evidence suggests that this doctrine represented a paradigm shift and placed greater emphasis on coordinating with diverse groups of stakeholders in communities before, during, and following disasters.

## Conclusion

This chapter briefly explored the concept of coordination as it relates to disaster management in the United States. State and local governments are generally responsible for managing disasters; as a result, there is signification variation in disaster policies and practices across the country. Coordination is often portrayed as a way to mitigate challenges associated with the country's decentralized and fragmented disaster management system. However, achieving coordination is problematic for many reasons; for example, participating organizations often lack the experience required to address the complex problems presented during disaster situations.

A greater emphasis on regional approaches to disaster management, the use of both formal, professional and informal mechanisms to train participants and connect them with one another in advance of disasters, and national doctrine are offered as alternatives for strengthening coordination at all levels.

By their nature, disasters present complexities and challenges that are difficult to overcome. Some disrupt the economy and the operation of businesses, while others result in loss of life and damage to property and the environment. Understanding the coordination of disaster participants – citizens, emergent groups, nongovernmental organizations, businesses, governmental agencies – may provide one clue toward achieving a disaster resilient future.

# Coordination Quality: Perceptions and Drivers Among Civil Servants

Tom Christensen[1] and Per Lægreid[2]
[1]Department of Political Science, University of Oslo, Oslo, Norway
[2]Department of Administration and Organization Theory, University of Bergen, Bergen, Norway

## Introduction

The dynamics of modern public sector reform waves, from structural fragmentation in NPM to attempts at structural reintegration in post-NPM, have resulted in a renewed interest in coordination in the government apparatus. Coordination is very high on the contemporary reform agenda in many European countries. Coordination capacity and quality is a key precondition for governments to address complex governance and policy challenges in the modern state. In a broad survey, top civil servants in ministries and central agencies in Europe were asked to assess the importance of various reform trends in their own specific policy field, and they ranked enhanced collaboration and coordination as the most important measure. Hierarchical command is the most common coordination mechanism in central government, but network arrangements are also rather common.

This article focuses on perceived coordination quality in ministries and central agencies in Norway. It will describe and explain how civil servants in central government perceive coordination quality, by addressing the following questions:

- How do civil servants assess the quality of coordination in their own field of work?
- How can one explain the variations in perceived coordination quality from a structural and a cultural perspective?

## Conceptual Clarification: Coordination

The literature of coordination in public administration is ambiguous, and different concepts and terms have been used. There are several partly overlapping synonyms such as collaboration (shared responsibility), coordination (shared work), and cooperation (shared resources). This article leans towards a government-centered approach focusing on coordination and the institutional and organizational dimensions. Coordination can be defined as the purposeful alignment of units, roles, tasks, and efforts in order to achieve a predefined goal (Bouckaert et al. 2010). Coordination is about adjusting the actions and decisions of interdependent actors to achieve specified goals (Koop and Lodge 2014). We distinguish between coordination capacity as an independent variable on the one hand and coordination quality relations as dependent variables on the other hand. Coordination capacity refers to administrative capacity within civil servants' fields of work when it comes to getting actors to collaborate and to cooperate. Coordination quality is the perceived quality of coordinating activity as it works in practice within the civil servants' field of work along different dimensions.

When assessing coordination quality, it is distinguished between *internal* and *external coordination* and *vertical* and *horizontal coordination*

(Christensen and Lægreid 2008). Internal coordination refers to coordination in and between governmental actors within a political-administrative system, whereas external coordination refers to interaction between the government and public or private organizations or stakeholders outside of it, e.g., civil society, international organizations, or municipalities. Vertical coordination is normally more hierarchy-based, while horizontal coordination is more collegial or networked-based.

## Theoretical Perspectives on Coordination

Coordination is both a structural and a cultural phenomenon. A structural-instrumental perspective and a cultural-institutional perspective are used to understand the variation in perceived coordination quality and capacity among civil servants. According to a *structural perspective*, decision-making processes in public organizations are influenced by the formal structure. It is assumed that formal structure matters for coordination quality. This perspective offers insights into variations in how coordination is experienced by civil servants in different policy areas, at different administrative levels, in different positions, performing different tasks, and in different coordination structures.

A general expectation is that perceived coordination quality will be seen as better within own policy area than across policy areas and administrative levels due to weaker organizational boundaries in the first case. Civil servants in overarching ministries will probably perceive transboundary coordination as better than civil servants working in line ministries or agencies without such transboundary responsibilities. Another expectation is that coordination quality will be perceived as better in ministries than in central agencies. Leaders are expected to score highest in their positive perceptions of a broad range of coordination forms. Further we will expect that civil servants who work with tasks that need collaboration across administrative levels and ministerial areas will perceive less coordination problems than other civil servants due to their resources and experiences. Also participation in network arrangements is expected to make a difference. Previous studies have shown that there is a significant positive correlation between network-based coordination instruments and perceived coordination quality. Coordination tends to be viewed more positively when horizontal network-based measures are used as coordination instruments. Finally, the overall coordination capacity is expected to matter. Civil servants who assess the administrative capacity of the public administration within their own field of work to get actors to collaborate and cooperate as good will probably assess the various measures of coordination quality as better than those who assess coordination capacity as poor.

From a *cultural perspective*, trust relations, common cultural values and norms, may facilitate coordination. The development of a public organization is seen as based on historical traditions and path dependency. Actors will think and act according to a logic of appropriateness, not a logic of consequence. The leadership of a public organization will have a central role in socializing and training employees to install a common cultural identity. Coordination in a cultural sense might mean to develop an integrated culture, so that civil servants and their leaders share common informal norms and values, which may in turn facilitate coordination in practice. The introduction and use of NPM reforms meant increased structural fragmentation and cultural heterogeneity, and a challenge for leaders under the post-NPM reforms is to bring public organizations culturally back together again.

Previous studies have revealed that there is a positive relationship between coordination culture and coordination quality along different dimensions (Lægreid et al. 2016). Three different sets of cultural variables are used to explain variety in civil servants' perceptions of coordination quality. First, a central precondition for working together towards a common cultural goal in the civil

service is *mutual trust*, measured by whether civil servants think the level of mutual trust between the ministry and subordinate agencies is high or not. The expectation is that a high level of mutual trust will enhance coordination quality, especially the vertical coordination within own policy area. Second, whether civil servants' tasks and areas of responsibility are characterized by a high or low level of *conflict* will supposedly influence coordination quality. The expectation here is that a high level of conflict will make coordination more difficult and challenging, because it is difficult to find common cultural ground. Third, what is typical for the *identity* of civil servants? The expectation is that civil servants scoring high on identification with the public administration as a whole will perceive overall higher coordination quality than those who mainly identify with their own ministry or agency.

## Context

The ministerial responsibility principle tends to produce strong administrative silos with relatively good vertical coordination within each policy area but weak horizontal coordination across policy areas.

New Public Management reforms have mainly been preoccupied with vertical coordination and have tended to aggravate the mismatch between vertical and horizontal coordination within government. In recent 20 years, the NPM reforms have been supplemented by post-NPM reforms which seek to enhance integration in the central government apparatus by introducing more network arrangements in the shadow of the hierarchy and also by merging administrative bodies.

Compared with other European countries, Norway scores relatively low on coordination through the internal administrative hierarchy, but the use of cross-boundary collegial bodies, such as working groups and project groups, is rather common. Norway's closer integration in the European Union through the Economic Area Agreement has also increased the need for external coordination.

This contextual situation illustrates the challenges that civil servants in Norwegian central government face when handling and assessing coordination issues. The expectations based on these contextual features are:

- That internal coordination within own policy area will be seen as relatively good in comparison with horizontal coordination across policy areas.
- That there will be coordination challenges vis-à-vis local and regional government.
- That increased integration into Europe will strengthen the quality of sectoral vertical integration upwards to the international level.
- Owing to the introduction of post-NPM reforms over the last years, transboundary coordination will be of higher quality in 2016 than in 2006.

## Database

The data used are taken from two unique comprehensive surveys of civil servants in Norwegian ministries and central agencies, conducted in 2006 and 2016. All civil servants in the ministries with at least 1 year tenure, from executive officers to top civil servants, and a representative sample of every third civil servant in the central agencies were included. The number of respondents in 2016 was 2322 in the ministries and 1963 in the central agencies. The response rate in 2016 was 60% in the ministries and 59% in the central agencies. Overall, this is a high response rate.

## Coordination Quality Across Time and Coordination Dimensions

Table 1 shows, first, a stable pattern over time regarding perceived coordination quality in central government. Despite an increased focus on political-administrative coordination in different

**Coordination Quality: Perceptions and Drivers Among Civil Servants, Table 1** Perceived coordination quality in ministries and central agencies. Percentage rating the quality as good or very good in 2006 and 2016

| | 2006 | 2016 |
|---|---|---|
| Coordination between governmental authorities within own ministerial area | 59 | 61 |
| Coordination with governmental actors in other policy areas | 38 | 39 |
| Coordination with regional and local government | 33 | 33 |
| Coordination with supranational or international organizations | 51 | 48 |
| Coordination with private sector/civil society[a] | 38 | 40 |
| *N (average)* | 1818 | 1843 |

[a]Ministries only

governments' reform programs and several mergers in the ministries and agencies, the civil servants' characterization of coordination on all coordination measures did not change significantly. There are few changes in perceptions of increased coordination in central government over time.

Second, there are interesting variations across coordination dimensions, which remain similar over time. Reported coordination quality tends to decrease significantly when crossing organizational, administrative levels or sectoral boundaries in the central government apparatus. This illustrates a general finding that organizational boundaries in central government affect both civil servants' perceptions and their actual behavior. The civil servants are much more satisfied with the coordination quality within their own policy area than across policy areas or administrative levels. This finding is in line with a general trend in Europe.

Third, the civil servants report better coordination quality upwards towards the European or supranational level than downwards to the local and regional levels. The weaker coordination downwards with regional and local bodies is a major concern in ministries and central agencies, and this reflects how coordination is constrained when the principle of ministerial responsibility meets local self-governance. In contrast, coordination upwards to the European and supranational level tends to work pretty well, which might reflect that the EEA agreement is largely based on the principle of specialization by sector in line with the domestic governance style in Norway. Even perceived coordination quality with the private sector is stronger than with the local level.

Compared with 16 other European countries, Norwegian top civil servants score significantly higher than average on internal coordination quality both vertically within own policy area and horizontally across policy areas and considerably lower on external coordination both with local and regional bodies and with stakeholders in the private sector.

The five coordination dimensions are more overlapping and supplementary than alternative. If civil servants are dissatisfied with coordination along one dimension, they also tend to be dissatisfied with coordination along other dimensions. Perceived internal coordination problems tend to go in tandem with external coordination problems, and vertical coordination problems often overlap with horizontal coordination challenges.

## Variation in Coordination Quality: Structural and Cultural Features

A multivariate analysis (Christensen and Lægreid 2019) shows that structural and cultural features can help to explain variations in perceived coordination quality. The most important explanatory factors are coordination capacity and mutual trust. This goes for all five coordination dimensions. Strong coordination capacity has a significant positive effect on perceived

coordination quality along all dimensions, which was expected. If civil servants perceive the administrative capacity within their own policy area to get actors to cooperate and collaborate as good, then the perceived coordination quality is good. If mutual trust relations between ministries and subordinate central agencies are strong, then coordination seems to be smoother along all quality dimensions horizontally and vertically, internal as well as external.

Other structural and cultural actors also matter. Administrative level has an effect on internal coordination within own policy area, horizontal coordination across policy areas, and vertical coordination with international bodies. For all these dimensions, the civil servants in the ministries perceive coordination as better than those in the agencies do. Policy field also makes a difference to the way that civil servants working in overarching ministries perceive the quality of coordination across sectors and international coordination as better. Participating in network arrangements also influences the perception of international coordination. Having transboundary collaboration tasks matters for coordination within own policy area, across policy areas, and also with civil society and the private sector.

Among the cultural variables, level of conflict also matters. Civil servants working on policy areas with a high level of agreement normally perceive coordination quality as better than those who work on issues involving a lot of conflict. Strong identification with central government in general also tends to go together with higher perceived coordination quality, especially across policy areas and with regional and local bodies.

If we compare the explanatory factors across time, we find a lot of robustness and stability (Christensen and Lægreid 2008). Both in 2006 and 2016, we find a combination of structural and cultural features as the main explanatory variables, and the demographic control variables do not have a strong influence. In both years administrative level is a main explanatory factor when it comes to horizontal coordination as well as coordination within own policy area. Generally, coordination across policy areas as well as within own policy sector is perceived as better in ministries than in central agencies. The same stable pattern occurs for mutual trust relations. Among all coordination dimensions, mutual trust is an important explanatory factor both in 2006 and in 2016. Coordination among different dimensions is perceived as significantly better if there is a high level of mutual trust between ministries and central agencies.

## Discussion

Both structural and cultural factors matter for coordination quality. Regarding structural features, a positive perception of overall coordination capacity correlates strongly with all the dimensions of coordination quality, and administrative level means a lot for the coordination quality dimensions. Regarding cultural features, strong mutual trust enhances coordination quality. Also, a low level of conflict is important for improving the perceived quality of coordination, because interaction and cultural integration then become easier. This indicates that structural and cultural variables might interact and that informal cultural integration is important as "institutional glue" that reaches beyond formal structural boundaries.

Going back to the expectations based on the Norwegian political-administrative context, it was expected a high score on perceived internal coordination quality in own policy area, and that is exactly what we found. This is very much a reflection of the "siloization" that is very typical for many European central civil services. We also expected challenges in coordination with regional and local government, which is reflected in the relatively low scores for coordination quality on this dimension. It was also expected that closer European integration would lead to higher perceived quality of international coordination. This was confirmed, and there is a higher score on this dimension than on horizontal coordination between policy areas.

Despite all reforms aimed at enhancing coordination, the perceived coordination quality on different dimensions has not increased, as expected, but has remained stable. Thus, there seems to be a loose coupling between reforms and perceived coordination quality in central government. One reason for this may be that coordination quality perceptions are not that much influenced by reforms, but more by cultural features and basic structure of the central civil service.

## Conclusion

This article has shown that coordination is important but difficult to achieve, especially transboundary coordination. It has also revealed a coordination paradox. On the one hand, major efforts have been made to increase coordination both vertically and horizontally, and several big reform initiatives have been launched to increase coordination between policy areas and administrative levels. On the other hand, perceptions of coordination quality among civil servants in ministries and central agencies have been rather stable and robust over the past 10 years. One interpretation of this pattern is that as long as the main governance doctrine of ministerial responsibility is not challenged, the leeway for increasing coordination between policy areas and administrative levels is limited. Another interpretation is that coordination is not only a logistical and technical issue but also a political issue. Coordination is about power relations. Civil servants generally prefer to coordinate than to be coordinated. As long as power relations are not changed, the room for increased coordination is limited. This brings us to the third point: Context matter for coordination quality, such as governance doctrines and integration into the EU. A fourth interpretation is that one should not expect too much from big structural reforms. Often reform agents tend to oversell the reforms and promise more than they can deliver.

When it comes to explaining variations in coordination quality, it is distinguished between "hard" structural/formal explanations and "soft" cultural features. The main finding is that both "hard" and "soft" measures matter. First of all, cultural features affect the coordination pattern. If one wants to improve coordination, an important lesson is to take cultural features into consideration, like in trust-based reforms. However, it is also shown that cultural features need to be complemented by structural features. It is especially important to strengthen coordination capacity. Good government means a high trust administration but also an administration with coordination capacity. The structural arrangements can both constrain and enable coordination quality. Perceived coordination quality varies with organizational boundaries and especially with the administrative capacity to get different actors to collaborate and cooperate within and across different areas.

## Synonyms

Cocreation; Codesign; Co-governance; Comanagement; Parallel production

## Definition

The involvement of citizens and/or community organizations in the design and delivery of the services they use or otherwise benefit from.

## Introduction

Public services have always relied on input from their users – be it pupils doing their homework, people remembering to take their medication, or neighborhood watch schemes contributing to local crime prevention. The term coproduction itself dates from the 1970s, a time when movements to challenge professional power and increase citizen participation in community affairs coincided with efforts to reduce public spending. Academics in the United States explored how to harness the input of people who use services, focusing particularly on municipal services such as waste collection, parking, road maintenance, and neighborhood policing.

From the early 1980s, the language of coproduction largely disappeared from policy. Policy makers and academics focused more on market approaches, which emphasized the separate interests of service producers and consumers, rather than the value of collaboration. However, the coproductive insight – that the people who use services have expertise and assets to contribute – continued to be evident in a range of reform movements in the nonprofit sector such as time banking and cooperatives. The last two decades have seen the return of coproduction as a mainstream idea in public policy. Coproduction is viewed as a way to combat many of the problems facing contemporary welfare states – such as stretched public finances, an increasing demand for more personalized services, technological advances, ageing populations, and other demographic changes. It is an approach with broad global appeal, drawing attention from the Organization for Economic Co-operation and Development (OECD) Directorate for Public Governance and Territorial Development and the World Bank.

## Types of Coproduction

People use the term coproduction in different ways. We can identify three different ways in which services are talked about as coproduced. The **first** is simply a **description** of how all services, including those in the private sector, rely on some productive input from users. The production and consumption of services are recognized to be inseparable, in contrast to the production and consumption of products. Here coproduction is merely the conceptualization of an existing practice. For example, education necessitates the active involvement and collaboration of both the student and teacher.

A **second** usage of coproduction is as the **recognition** of the productive contribution made by the people who use services, acknowledging their input, valuing and harnessing existing informal support networks, and creating better channels for people to shape services. There is an emphasis here on citizens as having **assets** rather than employing a deficit model of public services and the fostering of collaborative rather than competitive or antagonistic relationships between staff and service users. For example, bringing local community representatives into discussion about urban regeneration can be a way to recognize their lived expertise. However, this type of coproduction does not involve any shifts in the power relationships between different actors.

A **third** way of using the term coproduction is as an approach to **transform** public services. Here it is seen as bringing professionals and service users together to identify and manage new and existing risks and better meet the needs of citizens (Meijer 2016). This might involve innovative ways of designing and running services.

There is evidently a normative structuring to this tripartite approach. In other words, some of these are seen as better than others. The notion of coproduction as a *description* of existing practice is fairly limited in what it can achieve. The productive input of citizens may be little more than compliance with legal or social norms, such as making way for an emergency vehicle or not dropping litter. Coproduction as a form of *recognition* accounts for the contributions of citizens, communities, and professionals. This approach can promote increased understanding between multiple stakeholders. Those who deliver services can become more attuned to the individual circumstances, needs, and preferences of the people who use them. The *transformational* approach envisages behavioral change: more involved users and communities, who are invited to make a greater contribution to the service. Professions are expected to cede power and to share risks with users. Although rarely stated explicitly, the transformational approach to coproduction is the conceptualization of coproduction that has caught the imagination of policy makers.

## Who Is Coproducing?

Coproduction occurs when the input of citizens is complementary to the input of professionals, rather than substitutive. In other words, both professionals and citizens have resources and/or expertise that can benefit one another and ensure that coproduction leads to better outcomes than production by government or citizens alone (Ostrom 1996). The participants in coproduction may vary depending on the public service involved and may include service users themselves, their caregivers, or local community members in partnership with professional service providers. For example, home school contracts involve coproduction between parents and teachers, where parents become more actively involved in helping their children to learn, while large-scale community development projects can be coproduced by local citizens, businesses, government, and other local stakeholders.

Coproduction activities can be led by the state or by the nonprofit sector. Indeed, it may be that the nonprofit sector has closer links to communities which can make it easier for them to involve citizens in service design and delivery (Pestoff et al. 2012).

## Who Benefits?

One of the ways to separate out different types of coproduction has been to distinguish between **individual**, **group**, and **community** beneficiaries (Brudney and England 1983). Individual coproduction involves examples where the benefits are mainly targeted at an individual, such as involving patients in decisions about their own treatment. In group coproduction, the benefits accrue to the particular citizens who participate together rather than the wider community, an example being neighborhood watch schemes. Collective coproduction could include being a volunteer firefighter and helping out with park maintenance, with the benefits being dispersed across a community. However coproduction is not quite the same as volunteering. Coproduction is about people helping to shape the services which they themselves are likely to use or otherwise benefit from, whereas volunteering is usually seen as a more altruistic act of helping others.

## At What Stage Does Coproduction Take Place?

Coproduction primarily describes the involvement of people at the point of service delivery. It is also possible to involve the people who use services in the early stages of service planning, design, and commissioning and in the later stages of managing, monitoring, and evaluation (Bovaird and Loeffler 2012). Part of the coproductive challenge to traditional public services is to refute the very notion that people who use services sit at the end of a long delivery chain. If people are involved in codesign, they can help to identify the kinds of problems that a service is responding to, rather than just responding to

problems that someone else has identified. Coproduction can also be embedded in the management of a service, with users and communities having a place on the steering group or management board of the delivery organization.

## Examples of Coproduction

Instances of coproduction have been identified around the world and include coproduction between community members, disabled people and professionals, and older people and local citizens. For example, members of **time banks** share skills and companionship, based on time as the currency of exchange. Citizens support each other on a mutual aid basis, although professionals continue to play a key role in managing the credit system and facilitating access. Time banks were popularized in the United States but now exist in dozens of countries around the world.

Another example of coproduction is the **KeyRing** scheme in the United Kingdom (UK), which supports people with learning disabilities to live in their own homes (Poll 2007). A Community Living Worker offers a few hours per week of support to nine KeyRing network members in each locality and facilitates interaction between members. The role of the professional or volunteer caregiver is to facilitate self-reliance and mutual support, based on the expertise and skills of the people who use the service.

Similarly, Western Australia's **Local Area Coordination** (**LAC**) scheme involves locally based area coordinators, each providing support to between 50 and 65 people with disabilities, and providing financial support, varying from one-off discretionary grants to ongoing and intensive support (Bartnik and Chalmers 2007). The scheme is based on the assumption that services provided by government and community agencies complement and support the primary role of families, caregivers, and communities in achieving a good life for people with disabilities.

Finally, the French **Villa Family** program brings an older person with a disability into purpose-built accommodation with a trained host family, within or close to their home village (Bovaird 2007). The older people employ the host family (and have responsibilities as the employer) and can move if not satisfied. The older people are not financially dependent on host families – the state pays them a disability allowance.

C

## Making Coproduction Work

In her classic work on coproduction, Ostrom (1996) sets out four conditions which she suggests are necessary in order for coproduction to occur and provide better outcomes than government or citizen production alone. The conditions are that coproduction must be complementary rather than substitutive; there must be a range of options available to both professionals and citizens; all participants must be able to build a credible commitment to the process; and incentives exist for both sides. When these conditions are met, it is possible to see a number of benefits of coproduction. The benefits of coproduction include:

### Value for Money

Independent evaluation of the KeyRing project to support people with a learning disability to live independently found that the project delivered support cost-effectively. The Local Area Coordinators schemes in Australia have shown value for money as well as high levels of satisfaction from the people who use services. The potential for coproduction to access assets that were previously unacknowledged and may have been underused means that it may be more cost-effective than traditional approaches to service delivery. However, it is important to recognize that there may be costs to coproduction in training staff and supporting citizens. The cost savings generated by coproduction may be "soft" rather than cashable, for example, in reducing loneliness, increasing self-esteem, or enhancing trust.

### Incorporation of Expertise from the People Who Use Services

Coproduction recognizes that people who use services are "experts on their own lives" and their involvement can help to ensure that services are better designed and more effective (Poll 2007). It

can help to bridge the "them and us" culture between service users and staff by facilitating shared insights.

### Practical Skills

Coproduction can provide a number of practical advantages for participants, such as learning new skills and gaining access to information. Time banks, for example, can also be a way to develop more formal qualifications and opportunities. Being a peer support worker, for example, in mental health services, has been shown to offer various practical benefits for the support workers themselves, such as facilitating their moves into other forms of employment.

### Social Capital

Several coproductive schemes have reported positive benefits for social capital, through building supportive relationships, increasing personal self-confidence and activity, and fostering trust (Fledderus et al. 2014). The sorts of capital created by the schemes can benefit service providers and the broader community as well as the people who use services themselves. For example, the Villa Family project brings more young families into villages and helps them to integrate into those communities. The time banks appear to be more effective than traditional volunteering routes at attracting socially excluded sectors of the population and work well as a tool for social inclusion.

## Limitations of the Coproduction Models

Coproduction models, however, do have some limitations. These relate to the way in which coproduction may not help to overcome the marginalization of particular groups, the potential conflict with existing models of service delivery and existing institutions, and the culture change that is required of service professionals.

### Coproductive Schemes Can Reinforce Rather than Build Social Capital

Although the examples cited above show the potential for coproductive schemes to enhance social capital, there are clearly limits to the scope for some people to coproduce without support. Just as in participation initiatives more broadly, coproductive schemes may sideline groups that have been generally marginalized and underserved, such as people living in poverty; the homeless, black, and minority ethnic people; lesbian, gay, and bisexual people; older people; people with cognitive and communication difficulties; and those living in residential care settings.

There is also some concern that coproduction may be better at providing "bonding" social capital (helping to create links within communities) rather than "bridging" (making links between different communities). Connected to this is a concern that the collaborative nature of coproduction should not be seen too strongly in reciprocal terms, framed as what the people who use services will have to "pay back" in the future. Coproduction also must not be "government attempting to dump its difficult problems on users and communities" (Bovaird 2007, p. 855).

### Coproduction May Clash with Existing Frameworks of Service Provision

The KeyRing project had difficulty fitting in with a regulatory framework which is too focused on performance outputs rather than citizen outcomes. The tax and welfare regulations can be a problem for time bank participants. Risk aversion among statutory authorities was noted to be a constraint on innovation in some of the cases. Traditional notions of accountability may also be threatened as public/private; formal/informal resources become more closely linked (Joshi and Moore 2004).

### Coproductive Schemes Need Secure Funding and Organizational Support

A Government of Western Australia evaluation of the LAC scheme noted that the multiple demands being made on the scheme, such as to its scope, role, constituency, and accountability, threaten its medium- to long-term sustainability (Bartnik and Chalmers 2007, p. 34). In addition,

funding for time banks tends to be short-term and unstable.

### Coproduction Requires Support from and for Professional Staff

Most evaluations of coproduction highlight the importance of the relationship between the service user and the professional and the difficulties in making this relationship work well (Osborne and Strokosch 2013; Tuurnas 2015). Coproduction requires committed staff support, at least at early stages, which can be hard to reconcile with other priorities. Staff also need to be willing to share power with users. Officials can be reluctant to acknowledge the legitimacy of user expertise, and there is a danger that citizens feel "second-class workers" in dealings with professional staff. However, it is also clear that staff attitudes can be transformed through taking part in coproductive projects, building a greater awareness of the contributions of people who use services and a greater recognition of the assets held within communities.

## Conclusion

Coproduction is now a widely used approach to involving citizens and communities in the services offered by government and nonprofit organizations. Many initiatives have been called coproduction, but some advocates of coproduction suggest that schemes only really count as being coproductive if there is a cultural change. In other words, "It is, at heart, a *mindset* and a *style of working*. Co-production says that you start from the people themselves and find out what they think works well and what needs to be addressed" (SCIE 2009, p. 4, emphasis in the original). It is in this context that transformational coproduction can occur.

## Definition

**Co-production** indicates "collaborative approaches where citizens or service users engage in partnerships with service professionals in the design and delivery of a public service" (OECD 2011, p. 27).

In particular, the OECD report "Together for Better Public Services: Partnering with Citizens and Civil Society" (2011, p. 32) provides the following definition of co-production:

> A way of planning, designing, delivering and evaluating public services which draws on direct input from citizens, service users and civil society organizations.

According to Nabatchi et al. (2017), there are many different definitions of co-production in the literature, as summarized in Table 1.

**Co-production and Governance, Table 1** Definitions of co-production in the literature

| Author | Definition |
|---|---|
| Brudney and England (1983) | "Coproduction consists of citizen involvement or participation (rather than bureaucratic responsiveness) in the delivery of urban services. . . . coproduction stems from voluntary cooperation on the part of citizens (rather than compliance with laws or city ordinances) and involves active (rather than passive) behaviors" (p. 63) |
| Ostrom (1996) | "The process through which inputs used to provide a good or service are contributed by individuals who are not 'in' the same organization" (p. 1073) |
| Bovaird (2007) | "The provision of services through regular, long-term relationships between professionalized service providers (in any sector) and service users or other members of the community, where all parties make substantial resource contributions" (p. 847) |
| Pestoff (2009) | "Co-production provides a model for the mix of both public service agents and citizens who contribute to the provision of a public service" (p. 197) |
| Brandsen and Honingh (2016) | "Coproduction is a relationship between a paid employee of an organization and (groups of) individual citizens that requires a direct and active contribution from these citizens to the work of the organization" (p. 431) |

Source: Adaptation from Nabatchi et al. (2017)

The common element in these definitions lies in the new position of the citizens, who become contributors in all their multiple roles (e.g., consumers, clients, volunteers, etc.), and of the government officials (and/or officials acting by mandate of government, e.g., officials of third-sector organizations providing public services), who become a part of a broader system of actors in the co-production of public services.

The term "co-production" was coined by Elinor Ostrom during the 1970s, and despite the long history of the phenomenon, it has recently assumed renewed relevance in the public sector in the wake of austerity. The co-production of public services represents a new mode available to citizens to engage with public agencies coherently in what advocates

call the "new public governance" (NPG) paradigm. In particular, NPG-inspired reforms can be defined as the "coordination and use of the institutional arrangements formulated in policy-making and implementation processes aimed at the collective interest in a polycentric multi-sectoral stakeholder context to pursue the collective interest" (Antiroikko et al. 2011, p. 3).

NPG principles highlight the importance of public administrations looking outside their boundaries, where it is possible to find different competences and to better understand the needs of citizens. The reforms based on these principles follow a trajectory which goes from a unidirectional approach (information) to an interactive path (participation), from responsiveness to collaboration, where citizens and governments become partners (Vigoda 2002).

Thus, the underlying idea born under NPG was that networks of public, private, and nonpublic organizations and partnerships with citizens can increase effectiveness and efficiency (Voorberg et al. 2014) while maintaining the original and traditional public values and preventing the distortions created by the business-value orientation of new public management (NPM).

More specifically, co-production is based on the idea that citizens have individual and important skills, which have to be included in the work of public agencies in order to increase the quality and the effectiveness of public services. This phenomenon has the potential to reinforce the focus of policy makers and public service providers on the core issue of delivery of enhanced value to service users in such a way that it improves both the efficiency and effectiveness of public sector organizations (Osborne and Strokosch 2013). Further, co-production can improve the relationship between government and citizens, reinforcing service quality and responsiveness (Boyle and Harris 2009), democratic governance, accountability and citizens' empowerment (Ostrom 1996; Sancino 2016), trust, and communication (Needham 2008). Finally, co-production can produce internal positive impacts, valorizing frontline expertise (Needham 2008) and thus positively affecting the environment inside a public organization.

## State of the Art: Problems of Governance with Co-production

The involvement of citizens in service delivery changes traditional governance models. Governance is intended here as the structure whereby it is identified who has the decision-making power and about what issues they can decide (Kaler 2002), and, consequently, it involves the "processes of interaction and decision-making among the actors involved in a collective problem that lead to the creation, reinforcement, or reproduction of social norms and institutions" (Hufty 2011, p. 405).

In the case of co-production, a clear model of governance has still to be defined, and this is a key criticality to face.

While the contributions of multiple actors can have a positive impact, at the same time, they can generate criticalities, because the boundaries between the roles of different actors become blurred (Ostrom 1996; Bovaird 2007). Further, the absence of clear rules and a framework for decision making can undermine the potentialities of co-production. There are two main reasons. First, the values of the actors are different (Taylor 2003), and the nonexistence of a clear framework for decision-making can contribute to create conflicts. Second, not all the citizens have the same access to co-production, because of a lack of both knowledge and resources to co-produce. Consequently, the way in which co-production is realized can determine the creation (or not) of a gap between service outcomes for advantaged citizens, who can access co-production, and disadvantaged citizens, with limited or no access to co-production (Jakobsen and Calmar Anderson 2013).

Hence, first, there is the need to clarify the model of governance (and its elements) in the case of co-production by pointing out the framework whereby decisions are taken and implemented. Second, this model should be critically analyzed to verify whether it is able to assure that all conflicting interests are managed. Finally, gaps in the model should be faced to guarantee good governance.

## Future Perspectives: Toward the Definition of a New Model of Governance

This section will provide some clarifications of the model of governance in the case of co-production. In general, a governance model includes the following elements: actors, power and tasks, structure and relationships, and accountability (Stoker 1998). In the following paragraphs, each of these elements of governance will be examined in relation to co-production, paving the way for further reflection in order to clarify and to critically analyze them and their existing relationships.

### Actors

In general, the model of governance in the case of co-production of public services considers the involvement of providers and users of public services. Users can be represented by citizens and communities of citizens, and providers are represented by employees who are professionals in their field.

The participation of users can result in forms of (i) co-production and (ii) networks for inter-organizational collaboration. Or it can occur through the creation of hybrid organizations when the involvement of the users is institutionalized and incorporated into the public administration system (Grossi and Thomasson 2015).

### Power and Tasks

Providers are usually involved as professional "regular producers," while users provide efforts to enhance the quality and quantity of the services they receive (Parks et al. 1981). In the course of co-production, the providers and users bring different types of knowledge. Providers bring the one general knowledge of the core (primary) process of the organization and the production of service, and users bring their situational and local knowledge (Scott 1998).

A first classification based on the power and tasks of actors is based on the extent to which co-production involves tasks which are part of the organization's core services (Brandsen and Honingh 2016):

1. Complementary co-production in service design and implementation occurs when citizens are engaged in coproduction, but in tasks that are complementary to the core process rather than part of it (e.g., when parents help plan and organize extracurricular activities such as school excursions or help design and plant a school garden).
2. Complementary co-production in implementation occurs when citizens are actively engaged in the implementation but not the design of a complementary task (e.g., students assisting the university in organizing welcome days and parents helping prepare school plays).
3. Co-production in the design and implementation of core services occur when citizens are directly involved in producing core services of an organization and are directly involved in both the design and implementation of the individual service provided to them (e.g., post-graduate training modules in which entrants, together with instructors, define their own learning objectives and learning activities).
4. Co-production in the implementation of core services occurs when citizens are actively engaged in the implementation but not the design of an individual service which is at the core of the organization.

Another classification looks to the phases of service delivery in a traditional cycle – the design of policies and services (co-design), decision (co-decision), production (co-production), and evaluation (co-evaluation) (Pollit et al. 2006). For instance, participatory budgeting is an example of a co-decision, since citizens contribute to decide how to allocate public money, whereas when citizens are involved in the delivery of a service without being involved in its design or evaluation, as in the case of co-teaching, it is possible to refer to co-production in a strict sense.

Other classifications look to the different levels of inputs from citizens, articulated by Hirschman (1970) as follows: voice (providing feedback), choice (choosing service), contribution, and control.

**Co-production and Governance, Fig. 1** Type and level of change involved in co-production. (Source: OECD 2011, p. 40)

Finally, co-production has been defined as either additive or substitutive (OECD 2011). In the first case, citizens collaborate with the public administration; indeed, they add their value to the service (e.g., citizens are coordinated to respond to local emergencies with public defense professionals). In the second case, citizens replace public administrations (e.g., health programs based on peer leaders with chronic illness helping other patients by performing professional tasks, as support in managing pain) (Fig. 1).

According to the degree of transformation of the final service determined by citizens, co-production can be classified (Needham and Carr 2009) as least transformative, intermediate transformative, and most transformative. In the first case, co-production is a simple explanation of the service, which is conditional on productive input from the citizen or user. For example, this is the case of students who simply do their homework. Intermediate transformative co-production happens when citizens actively participate in the production of public services, and their efforts are also formally recognized by the public administration, for example, by the institutionalization of their role in hybrid organizations. In this case, participation aims to improve services and establish a stable relationship between service providers and citizens. Finally, the most transformative co-production is characterized by a radical transformation of the service with a complete switch of powers, responsibilities, and control. This happens when the service is mostly planned, managed, or governed by the service users.

## Structure and Relationships

Structures in the case of co-production differ from the traditional vertical and horizontal relationships generally used in the public sector.

The vertical relationship between governments and citizens was born within the old traditional welfare system. It was based on a strict hierarchy in which the principals were the citizens and the agent was the government (Grossi and Thomasson 2015). In this perspective, people delegated to the government the responsibility for the delivery of public services by electing politicians to control and govern public administrations. Therefore, this vertical accountability relationship

is based on democratic values (Hodge and Coghill 2007). But this relationship leaves no room for user involvement (Pestoff 2009).

In the horizontal relationship, citizens were treated as customers of public services provided by purchasers, and, in turn, the government was the purchaser of public services from providers (Grossi and Thomasson 2015, p. 4). In that case, there was a horizontal accountability relationship between the government and organizations providing public services, based on market and financial mechanisms to test performance, and another relationship between citizens and organizations, based on market mechanisms. This relationship based on the consumerism of citizens and professionalism of providers also leaves no room for user involvement (Pestoff 2009).

Inspired by NPG reforms, relationships in co-production follow an interactive trajectory (Vigoda 2002). Networks created by co-production are usually "noncompetitive contractual partnerships," created with the aim to (i) include citizens' resources, knowledge, and skills in public service, (ii) increase citizens' participation, and (iii) improve the quality of processes and products (OECD 2011; Voorberg et al. 2014). In this case, citizens are involved in public administrations decisions. This relationship is based on participation and encourages it in the belief that citizens should engage personally in shaping the services they demand (Pestoff 2009). Fung (2015) claims that the potential of citizen participation is to advance three values of democratic governance: effectiveness, legitimacy, and social justice. Citizens can make several contributions to solving difficult problems; in particular, "citizens can sometimes become directly engaged in solving public problems and thus contribute additional resources through co-production" (Fung 2015, p. 517).

The interaction between actors is based on a "rough consensus" and self-regulation rather than on a hierarchal chain (Miller 2014).

### Accountability

Partnerships operate in an uncertain authority and accountability environment. The instance of clear rules and hierarchal chains and clear boundaries erodes accountability and obscures who is accountable for what (Skelcher et al. 2005). The high level of stakeholder engagement gives rise to the fragmentation of accountability and the scarce regulation of stakeholder power (Bovaird 2007).

Accountability in co-production has still to be defined; however, in this context, diagonal forms of accountability seem to be suitable in the case of co-production (Ackerman 2004).

Diagonal accountability is located within the domains of vertical and horizontal systems. It happens when citizens engage horizontal accountability agencies with the aim of improving oversight systems of state actions (The Transparency and Accountability Initiative 2016). In this case, citizen co-producers cooperate with state pro-accountability agencies in order to strengthen government accountability (Ackerman 2004). Societal actors may also control these agencies and ask for their actions. Goetz and Jenkins (2001) argue that in diagonal accountability, it is possible to find vertical actors carrying out horizontal functions.

## Conclusions

The diffusion of the co-production of public services was fostered by the shift from the paradigm of traditional government (old public administration) to the paradigm of new public governance (Bingham et al. 2005).

The key question to face is which governance of co-production can assure a "good governance" to ensure that all conflicting interests are managed. As elements of good governance, this chapter refers to the following (e.g., Graham et al. 2003):

1. Participation.
2. Rules of law: existence of a legal framework.
3. Transparency: decisions are taken, and their enforcement is performed in a manner which follows rules and regulations; information is freely available and directly accessible to

those who will be affected by such decisions and their enforcement.
4. Responsiveness: institutions and processes try to serve all stakeholders within a reasonable timeframe.
5. Consensus oriented: mediation of the different interests in society to reach a broad consensus.
6. Equity and inclusiveness: ensuring that all of society's members feel that they have a stake in it and do not feel excluded.
7. Effectiveness and efficiency: processes and institutions produce results which meet the needs of society while making the best use of resources at their disposal.
8. Accountability: not only governmental institutions but also citizens and communities of citizens must be accountable to the public and to their stakeholders. It requires transparency and the rule of law.

The co-production of public services finds its foundation in the *participation* of citizens/users in the public service cycle. Specifically, citizens/users have a direct voice in the decision-making process, and their contributions can vary in the extent to which they determine public services. The government itself is expected to motivate citizens/users to participate in co-production processes. Indeed, one of the main reasons why co-production takes place lies in the need of governments to improve their *responsiveness* to citizens'/users' needs. The empowerment of citizens/users can facilitate the identification of the main problems to cope with and how to address them, thus reinforcing the ability of public organizations to meet community expectations. This implies the need to guide negotiations among different actors in order to reach a *consensus* about what to co-produce and how. In turn, the attempts to empower citizens in order to increase government responsiveness to their needs require that the same opportunities should be recognized for all the members of the community, building co-production on *equity* and *inclusiveness*. However, as a side effect, co-production may produce distorted effects, creating a gap between actors with a diverse access to knowledge about co-production and with different resources to co-produce. Equity and inclusiveness thus represent challenging issues in the case of co-production. Further, co-production lacks clear and unique legal frameworks which discipline its process (*rule of law*). Consequently, as a result of the lack of standardization of the process, there are no indications about the information to be produced and reported on the process of co-production. This lack of *transparency* in the flow of information challenges the measurement of *efficiency and effectiveness*, although the improvement of these latter concepts is one of the key purposes of co-production. Finally, the involvement of multiple actors, and especially the participation of citizens, challenges traditional mechanisms of *accountability*, and the lack of clear rules, division of power and tasks, as well as limited transparency contributes to make more difficult the management of the relationships between the different actors. Therefore, although co-production can be argued to be designed to strengthen the accountability of public organizations toward citizens/users, it still needs careful implementation.

On the one hand, co-production can be argued to be good for guaranteeing participation, consensus orientation, and responsiveness. On the other hand, it calls for elaborating guidelines to orient the co-production process and to reinforce its transparency in managing equity and inclusiveness and in contributing to improve the efficiency and effectiveness of public services. Finally, co-production needs suitable and effective mechanisms of accountability to be sustainable and successful in the long term.

# Corporate Crisis Management

Tham T. Nguyen
Gaylord College of Journalism and Mass Communication, University of Oklahoma, Norman, OK, USA

## Synonyms

Crisis communication; Organizational crisis management

## Definition

The term *crisis* refers to any significant threat that can affect a corporate's operations, its reputation, or even its existence, if the corporate fails to handle it properly. The threat may also cause negative consequences for the corporate's stakeholders or even for an entire industry (for instance, a big financial firm going bankrupt can shake the financial industry). Three related threats in a crisis include (1) public safety (for instance, industrial accidents or product tampering, which cause injuries or loss of lives, damage the environment or the water supply system), (2) financial loss (i.e., management misconduct that can disrupt operations, cause loss of market share or revenue and lawsuits), and (3) reputation loss (Coombs 2014). The three threats are interrelated. Any crises that involve injuries or fatalities can cause financial and reputation loss. Also, reputation loss can have a financial impact on organizations (Coombs).

Corporate crisis management refers to the process of preventing or reducing the potential damage of a crisis to a corporation and its stakeholders. Crisis management consists of three phases: (1) pre-crisis, (2) crisis response, and (3) postcrisis.

## Introduction

Corporate crises are unwanted and unpredictable incidents that can befall any firms during their lifetime. Planning and coordination in crisis management is important, despite the urgency of a crisis situation. Strong decisive leadership is crucial in all crisis management phases. The popularity of social media adds more tasks in media scanning and social media communication, especially in the wake of a crisis. This entry will discuss types of crises, crisis management phases, social media communication, and leadership in crisis management, followed by the implications for policymakers in crisis management.

## Types of Crises

There are various approaches in classifying crisis types (for instance, Coombs 2007; Sohn and Lariscy 2014). Sohn and Lariscy categorized crises into operational crises and reputational crises. Operational crises refer to incidents that threaten the operations of an organization, such as a defective product that requires a product recall or a severe accident in a factory. Negative media coverage generated by operational crises can inflict reputational crises (Barton 2001). Depending on the situation, a crisis can involve both operational and reputational crises, or it can involve one of each factors (Coombs 2014). Generally, poor organizational management can cause a crisis and will damage a corporation's reputation to a certain degree (Dilenschneider 2000).

In the situational crisis communication theory research, Timothy Coombs categorized crisis types into three crisis clusters: the victim cluster, the accidental cluster, and the intentional cluster (Coombs 2007). In the victim cluster, the organization is viewed as a victim and not held responsible for causing the crisis. While the organization is attributed to causing the crisis in the accidental cluster, the crisis situation is viewed as simply an accidental or unintentional

act. The organization is blamed for most of the causes and takes responsibility in the intentional crisis clusters. The level of reputational threat to an organization is minor in the victim cluster, moderate in the unintentional cluster, and high in the intentional cluster.

Crisis management attempts to prevent or diminish potential damage to an organization and its stakeholders. Crisis management should involve three stages: pre-crisis, crisis response, and postcrisis (Coombs 2014). The pre-crisis phase focuses on prevention and preparation. The crisis response phase involves the actual response in the wake of a crisis. The postcrisis phase evaluates the effectiveness of crisis responses and the lessons learnt. It provides follow-up information and implements actions that were promised while responding to the crisis. For instance, if an oil and gas organization promised to clean the beach and help affected communities after an oil spilling accident, they have to fulfill their commitments and solve the environmental issues, as well as support the affected residents and businesses.

## Crisis Management Phases

### Pre-crisis Phase

Pre-crisis phase consists of prevention and preparation activities. Prevention activities aim to detect potential risks that can lead to a crisis. Effective crisis management requires crisis managers to cooperate with risk management teams to detect risks in order to prevent it from escalating into a crisis. Preparation consists in creating a crisis management plan, conducting training for a crisis management team, and practicing the execution of the crisis management plan (Coombs 2014). The crisis management plan is not a step-by-step guide; instead it is a reference source for crisis management. A crisis management plan should have a designated crisis management team with defined tasks and responsibilities, provide lists of key contact information and important actions to respond to a crisis, and require using forms to document the crisis responses.

The crisis management team should include heads of departments or divisions of an organization, such as public relations, legal, finance, human resources, security, and operations (Barton 2001). Crisis management team members should participate in crisis management training and practice the handling of hypothetical crisis scenarios. Training for the spokespersons is also crucial before a crisis hits (Lerbinger 1997). Pre-draft messages prepared in the crisis-planning phase are helpful for the crisis team to add relevant information with the purpose of communicating in a timely manner. Since each crisis is unique, crisis decision-makers need to respond in unique and ethical ways. Discussing decision-making procedures to decide key crisis response strategies, key messages, and choosing communication channels to reach target audiences are important elements in the pre-crisis phase. Pre-crisis management should also incorporate guides on internal communication with employees and communication behaviors on social media in the wake of a crisis.

### Crisis Response Phase

Crisis response phase consists of actions and communication messages that the crisis management team does and says. Two major steps include (1) the initial crisis response and (2) reputation repair and behavioral intentions (Coombs 2014). The initial crisis response concerns the timeliness, accuracy, and consistency of the crisis response. In the first hour after a crisis hits, a crisis manager is under pressure to have a statement ready in order to tell the organization's side of the story (Coombs). Crisis preparation and templates help crisis management teams to draft and deliver key messages in a timely manner and appear to be a primary information source, rather than letting the news media fill in the information. Also, time pressure can increase risks of gathering and delivering inaccurate information. Although the organization can modify incorrect information, they will appear inconsistent and incompetent in crisis responses. Thus, crisis responses suggest that the organization speaks with one voice to maintain accuracy and address any confusion (Coombs). One voice does not mean that only one person

speaks; instead it is about conveying a consistent message to address public concerns of safety and reduce threats.

The idea of *stealing thunder* is also a concern during crisis responses. *Stealing thunder* suggests that an organization should release information about a crisis before any third-party information sources, such as news media and other sources (Arpan and Roskos-Ewoldsen 2005). By doing this, an organization appears to be more credible as the primary information source. It reduces the risk of inaccurate information disseminated by third-party sources and creates a better chance to communicate with the organization's stakeholders during a crisis situation.

### Postcrisis Phase

Although an organization is returning to its regular activities and is no longer the focal attention, as in the wake of a crisis, the organization still needs to implement several actions, including providing follow-up information, learn from its failure, and possibly commemorate victims (if any and if appropriate) (Coombs 2014). First, the organization should provide additional information as promised (i.e., rebuild damaged facilities, correct actions in misconduct management, or report on the investigation of the crisis). Postcrisis phase also requires crisis managers to provide follow-up information as promised to a reporter, as well as keep their employees updated on the recovery process through internal communication (i.e., intranet enterprise social networking, email).

Second, a crisis management team should conduct necessary evaluations of its crisis responses and integrate lessons learnt into the organizational crisis management system in order to be better prepared for future crises. Third, if a crisis causes fatalities or injuries, an organization should scan social media to ascertain whether there is any sign of the victims being honored, as well as consult with the victims' families to determine whether the organization can assist in contributing to anniversaries or memorials (Coombs 2014). For instance, West Pharmaceuticals built a physical memorial to commemorate those who lost their lives in the explosion at their plant in Kinston, North Carolina, in January 29, 2003. West Pharmaceuticals also kept the media, its employees, the community, and the general public informed on its plant-rebuilding project (Coombs).

## Social Media and Corporate Crisis Communication

Social media refers to a variety of Internet channels and applications that allow individuals to create content by posting their ideas and images publicly (Coombs and Holladay 2012). Social media crisis could be any incident that has emerged because of, or has been amplified, by social media. Social media crisis is different from customer service issues. Yet, a customer services issue, which is not handled properly, can precipitate public critique on social media and escalate into a crisis. Thus, it is crucial for crisis managers to identify both the social media's role in crisis communication, as well as how to integrate social media management in the three crisis management phases.

Although the basic elements of crisis management are still viable, a crisis management team needs to execute some activities when incorporating social media into the crisis management plan (Coombs 2014). First, social media adds new sources to the media scanning process. Monitoring relevant content in traditional and social media enables the organization to identify potential threats that can affect organizational activities. Second, the crisis management team should have a social media or digital public relations manager. Third, crisis managers may have to react under time pressure with the advent of the Internet and social media. Thus, crisis managers should try and use social media more efficiently in crisis management efforts.

## Leadership in Corporate Crisis Management

Leadership is a demanding process that becomes even more complex in crisis situations. While effective leadership can create opportunities

while recovering from a crisis, ineffective leadership can cause a further crisis or make a crisis worse. Leadership in crisis management requires cooperation with key personnel and partners, an appearance of empathy toward victims and their families (if any), as well as openness and honesty. Postcrisis leadership should evaluate the effectiveness of crisis responses, explore opportunities for renewal, and improve crisis preparation activities.

Responding to a crisis situation is not only an execution of the crisis management plan but also a reflection of leadership in handling a significant threat to organizational operations and its reputation. A crisis leader should be a storyteller and make sense of events in order to address any confusion, bewilderment, and disorientation (Hutson and Johnson 2016). Thus, a leadership message should be compelling and legitimate with the purpose of creating a personal connection with target audiences and convey emotions to bolster hope.

Crisis leadership requires a leader to have a vision, to understand the crisis situation, to stay calm, and be able to handle events under time pressure. A leader with a long-term view provides resources for crisis management efforts, which include delegating tactical crisis management to a trusted person, such as a deputy or an experienced public relations practitioner, assigning a crisis management team, and having a crisis communication plan to guide crisis responses (McGinn 2017).

Ideally, leadership in crisis management performs two functions, including using a suitable management style to cooperate and motivate the workforce and improving the management's ability to undertake necessary restructuring in personnel, operations, or policies (Müller 1985). Although there is a great deal of variance from leader to leader, a leadership style can affect crisis management efforts (Northhouse 2012). Several popular leadership styles in a crisis management context include authoritarian, democratic, laissez-faire or non-leadership, contingency, and transformational leadership styles (Northhouse). While an authoritarian leadership style tends to directly give orders and specific instructions, a democratic leadership style is more open to the ideas of individuals, and the leader is more likely to offer suggestions. Laissez-faire or non-leadership style allows followers to do whatever they want without giving directions and offers limited or no supervision.

Other approaches in leadership styles are contingency and transformational leadership (Northhouse 2012). Contingency leadership suggests that a leader should employ different leadership styles based on his/her relationship with followers (good versus bad), the characteristics of a task (clear versus unclear, certain or uncertain situation), and the power of the leader in controlling the situation to minimize potential harm. Meanwhile, the transformational leadership style suggests a dialogue with the followers to create agreement on a shared vision and objective. This approach can motivate their followers to share their ideas in order to achieve extraordinary outcomes.

## Implications for Organizational Policymakers in Crisis Management

While threats can cause a crisis, effective crisis management enables organizations to minimize potential damage. Although a crisis could be an opportunity for an organization to emerge stronger than it was before the crisis, it is not an ideal way to develop organizational business. Because crises can happen to any organization, organizations need to prepare for crisis incidents and incorporate social media communication policies into their crisis management.

Organizational behavior and policies can have certain impacts on strategic stakeholders. Failing to address public concerns may ignite conflicts that affect the implementation of organization programs or policies. For example, the US Army Corps of Engineers and its alliances did not appropriately address Native American concerns on environmental issues regarding the construction of Dakota Access Pipeline Project. Consequently, they were faced with the Standing Rock protests from April 2016, and the project was

consequently delayed until February 2017. Thus, building and maintaining strong relationships with strategic stakeholders are crucial in crisis management, as well as the decision-making process of organizational policymakers.

# Corporate Governance and Readability of Annual Reports

Md. Shariful Islam
Institute of Business Administration, University of Rajshahi, Rajshahi, Bangladesh

C

## Synonyms

Annual reports: corporate annual reports; Corporate governance: governance; Narrative texts: texts, nonfinancial statements

## Definition

Corporate governance: involves bringing balance in the interests of the company's diverse stakeholders such as shareholders, management, employees, customers, suppliers, government, community etc. It incorporates a broader horizon of scope of management from internal control and action plans to performance measurement of the company and corporate disclosure to stakeholders. Readability of annual reports: expresses the degree of ease in comprehension of language and its structure in text messages of corporate annual reports that are published as a part of required corporate disclosures of companies.

## Introduction

The primary objective of corporate annual reports is to provide financial information to users. Although information about the performance of a company can be obtained from many different sources, corporate annual report is considered as the most important source because of its wide coverage, availability, and legal status. Joint stock companies provide information to the users in the form of quantitative financial statements and narrative texts. Income statement, balance sheet, statement of changes in financial condition, and a summarized time series of performance are presented with quantitative figures.

The narrative texts include management's discussion and analysis (MD&A), the executive's letter, auditor's report, notes to the accounts, etc. A number of studies have been conducted on the amount of time spent reading annual reports. It is observed that the most widely read section of corporate annual report is the executive's letter to the shareholders (Hynes and Bexley 2003). As this section of annual reports is written in language or in text form, good readability of these narrative texts is important. The following section of the chapter presents corporate annual report and its contents, a brief description of readability and finally, importance of readability of annual reports in corporate governance.

## Corporate Annual Report

Corporate annual reports, popularly known as annual reports, are statutory reports prepared by companies at the end of each reporting year, which might be either on a calendar or fiscal basis. It incorporates various financial statements, reports, speeches, notes, highlights, graphs, charts, pictures, figures, ratios, etc. Annual reports are read by stockholders, potential investors, creditors, employees, regulatory authorities, and other interested users of financial statements.

Lee (1982) divided the elements of annual reports into four major sections: (a) the introduction to the financial results, (b) an overview of the financial results, (c) the main financial statements, and (d) the back-up reports to the main financial statements. A structure of an annual report based on Lee's presentation is given below.

(a) **The introduction to the financial results**
  (i) Notice of meeting
  (ii) List of directors
  (iii) Summary of results
  (iv) Financial calendar
(b) **An overview of the financial results**
  (i) Chairman's report
  (ii) Directors' report
(c) **The main financial statements**
  (i) Auditor's report
  (ii) Income statement
  (iii) Balance sheet
  (iv) Accounting policies
  (v) Notes to the accounts
  (vi) Sources and application of funds statement
(d) **The back-up reports to the main financial statements**
  (i) Five-year records
  (ii) Application of sales revenue
  (iii) Employment report
  (iv) Providers of capital
  (v) Financial relationship with govt.
  (vi) Store development

Components of the abovementioned list can broadly be divided into two major categories: financial statements and nonfinancial elements. Nonfinancial elements present information in verbal language where readability applies. As this chapter focuses on corporate governance associated with readability of corporate annual reports, nonfinancial elements of annual reports have been discussed in the following section.

### Nonfinancial Elements of Annual Reports

Major nonfinancial elements of corporate annual reports include management's discussion and analysis of earnings, auditor's report, and notes to the accounts.

#### Management's Discussion and Analysis of Earnings

In annual reports management summarizes among others the current year performance, future plans, reasons for changes in results of operations, capital resources, and liquidity. The section is designed to help users of the annual report to understand the extent to which changes in business activity and financial performances have affected the comparability of year-to-year data. It helps users, mainly investors, to assess the source and probability of recurrence in earnings of the firm. Subjects that are commonly discussed in annual reports by management include material changes in discretionary costs, material changes in assumptions underlying deferred costs, and significant changes in product mix or in the relative profitability of lines of

business, etc. Management's discussion and analysis of earnings are usually presented under two heads:

(i) Chairman's address
(ii) Directors' report

### Auditor's Report

The Auditor's report is a formal opinion given by either an internal auditor or an appointed external auditor as a result of an internal or external audit performed by the auditor. The report is subsequently incorporated in the annual report with an objective to help the users of the annual report to make decisions based on the results of the audit report provided thereof.

### Notes to the Accounts

Annual reports prepare a list of notes to the accounts that aim to provide detail and explanations on the information presented in the financial statements such as balance sheet, income statement, and cash flow statement. Notes to the accounts reflect the accounting principles that have been followed in preparing financial statements of the respective year and the facts that can have a significant impact on decision making of the reader of accounting information in the annual report. As a result notes to the accounts is often considered as simply expanded part of financial statements.

## Readability

Readability expresses the degree of difficulty of language and its structure. As a concept or as an area of research the term readability has been characterized by a variety of definitions and a number of measurement formulae (Lewis et al. 1986). Readability tries to match the ability of the reader and text and then tries to assess the ease to comprehend the text for the reader. Though readability and comprehension are different concept, Dale and Chall (1948), henceforth as Dale-Chall, assert that comprehension is a variable of readability itself. According to Dale-Chall, other variables of readability are fluency and interest.

### Brief Description of Readability Formulae

There are a number of readability measures available, namely, Dale-Chall (1948), Flesch (1948), Fog (1952), Kwolek (1973), The Fry Graph (1977), Lix (1968), etc.

### Flesch Index (1948)

The Flesch index was devised by Rudloph Flesch in 1948. For getting a score of readability of the text it uses a combination of sentence length and syllable count. Lower the score, the more difficult is the passage for the reader. The Flesch index was developed using the 1925 McCall-Crabbs standard test lessons in reading. An equation has been used that finds a reading ease score for the concerned passage of text. The reading ease score may range from 0 (most difficult) to 100 (least difficult). The Flesch index is expressed as follows:

**Reading ease** = 206.835 – (0.846 × SYLLS/100 W) – (1.015 × WDSSEN)

**SYLLS/100 W** = syllables per 100 words

**WDSSEN** = average number of words per sentence

(Lewis et al. 1986, p 201)

Seven-point general reading ease scale and educational attainment level of Flesch index is shown in Table 1 (Lewis et al. 1986, p 203).

### Fog Index (1952)

The Fog and Flesch indexes have similarity as both use the McCall-Crabbs test lessons in reading as a criterion of difficulty of the text. But unlike the Flesch index, the Fog index is based on the percentage of polysyllabic words (words with three or more syllables in a sentence). It

**Corporate Governance and Readability of Annual Reports, Table 1** Flesch reading ease scale

| General reading ease scale | Flesch score | Educational attainment level |
|---|---|---|
| Very difficult | 0–30 | Postgraduate |
| Difficult | 30–50 | Undergraduate |
| Fairly difficult | 50–60 | Grades 10–12 |
| Standard | 60–70 | Grades 8–9 |
| Fairly easy | 70–80 | Grade 7 |
| Easy | 80–90 | Grade 6 |
| Very easy | 90–100 | Grade 5 |

**Corporate Governance and Readability of Annual Reports, Table 2** Fog reading ease scale

| General reading ease scale | Fog score (Grade) |
|---|---|
| Very difficult | 13–17 |
| Difficult | 11–12 |
| Fairly difficult | 10 |
| Standard | 9 |
| Fairly easy | 8 |
| Easy | 7 |
| Very easy | 6 |

**Corporate Governance and Readability of Annual Reports, Table 3** Lix reading ease scale

| General reading ease scale | Lix score |
|---|---|
| Very easy | 20<br>25 |
| Easy | 30<br>35 |
| Medium | 40<br>45 |
| Difficult | 50<br>55 |
| Very difficult | 60 |

expresses difficulty of text in required grade levels rather than absolute scores. The formula used to get the Fog index is:

**Grade** = 0.4 (WDSSEN + % PSW)

**WDSSEN =** average number of words per sentence

**% PSW** = percentage of polysyllabic words

(Lewis et al. 1986, p 200)

Seven-point general reading ease scale for Fog index is shown in Table 2 (Lewis et al. 1986, p 203).

### Lix Test (1968)

The Lix test was developed by Bjornsson to assess readability of text that is written by using varying languages (Anderson 1981). Anderson's study indicates that this technique is useful across languages. The Lix formula has been tested for Swedish, French, English, German, and Greek texts. It is also argued that this tool is also suitable for technical languages such as accounting (Lewis et al. 1986). The formula for getting Lix score is:

**Lix** = Word length + Sentence length

**Word length** = percent of words of more than six letters

**Sentence length** = average number of words per sentence

(Lewis et al. 1986, p.201).

Five-point general reading ease scale of Lix test is shown in Table 3 (Anderson 1981, p 11).

### Dale-Chall (1948)

The Dale-Chall readability formula predicts vocabulary difficulty based on a list of 3000 best known words by 8 years old in the USA (Lewis et al. 1986). This formula measures unfamiliar words for the reader in the text with average number of words per sentence. Dale-Chall is very difficult to use because the formula requires application of over 30 rules for determining whether the words are familiar or unfamiliar. The formula is:

**United States Grade** = (0.1579 × % UFMWDS) + (0.0496 + WDSSEN) + 3.6365

**WDSSEN =** average number of words per sentence

**% UFMWDS** = percentage of Unfamiliar words

(Lewis et al. 1986, p 200).

Seven-point general reading ease scale for Dale-Chall test is shown in Table 4 (Lewis et al. 1986, p 203).

### Kwolek (1973)

This is a modified readability index to measure readability of a text. This formula measures percentage of hard words for the reader with average number of words per sentence. Words that consist of more than three syllables, abbreviations and symbols have been considered as hard words for the purpose. The formula used for measuring Kwolek is as follows:

**Grade** = 0.593 (WDSSEN/2 + %H)

**WDSSEN =** average number of words per sentence

**% H** = percentage of Hard words

(Lewis et al. 1986, p 200).

**Corporate Governance and Readability of Annual Reports, Table 4** Dale-Chall reading ease scale

| General reading ease scale | Dale-Chall |
|---|---|
| Very difficult | ≥10.0 |
| Difficult | 9.0–9.9 |
| Fairly difficult | 8.0–8.9 |
| Standard | 7.0–7.9 |
| Fairly easy | 6.0–6.9 |
| Easy | 5.0–5.9 |
| Very easy | ≤ 4.9 |

### The Fry Graph (1977)

The Fry graph technique is different from other techniques discussed earlier because it does not use formula. Instead it measures and presents the readability of the text by graph. Horizontal axis of the graph presents average number of syllables per 100 words, while average number of sentences is presented on the vertical axis. As it presents information by a visual aide, it is considered as a simple and familiar technique for the readers.

## Importance of Readability in Corporate Governance

Readability of annual reports is important for ensuring corporate governance. A number of studies address this issue. Research shows positive association between poor readability of annual reports and poor performance of companies (Subramanian et al. 1993; Smith and Taffler 1992a, b). Researchers reveal that management tries to suppress bad news consciously or subconsciously through obfuscation or poor readability of texts in annual reports (Adelberg 1979). For instance, Enron's communications during its final 3 years before collapse were examined and found that while the company's performance began to sink, its letters to shareholders and speeches by top executives became more laden with ambiguous words and sentences (Gonsalves 2003). Baker and Kare (1992) find a strong association between the Flesch score and return on equity. Smith and Taffler (1992a, b) find in a comparison of failed with nonfailed firms that the Lix and Flesch tests are good predictors of corporate failure. They conclude that "poor readability is associated with poor performance and ease of readability with financial success" (1992a). In another study, Subramanian et al. (1993) find significant relationships when testing "good" or "poor" performing corporations against readability. In particular, their analysis shows that the annual reports of good performers are significantly easier to read than those of poor performers.

A few researchers find association of readability of annual reports with size of firms. Jones (1988) suggests that readability and sales of a firm are significantly negatively correlated. This confirms that as a firm grows in size annual reports become more sophisticated and difficult to read. Jones also finds a significant decline in readability after the company was listed on the London stock exchange. Islam (2016) shows that larger privately owned commercial banks in Bangladesh have tendency to use difficult languages in their corporate annual reports.

## Conclusion

It is evident from previous discussion that readability of corporate annual reports is not same in different companies. It is also evident that there is a relationship between performance/size of companies and readability of respective annual reports. As it is seen by many researchers that poor performance tends to make the annual reports more difficult to read for the users and in some cases larger companies make their annual reports difficult for readers, both have implications on corporate governance. There must be guidelines from appropriate regulatory authorities regarding readability of annual reports to resist poor performing companies of hiding their weaknesses by using difficult languages and larger companies of using difficult languages as a means of differentiating them from smaller firms. In this way annual reports will be able to convey information to its users more effectively. Hopefully this may help in upgrading corporate governance.

# Corporate Governance and Sustainability

Daniela M. Salvioni and Francesca Gennari
Department of Economics and Management, University of Brescia, Brescia, Italy

## Synonyms

Comparative corporate governance; Convergence in corporate governance according to globalization and Corporate Social Responsibility (CSR); Environmental, social, and governance (ESG); Harmonization of corporate strategy, objectives, and performances; Hybridization of corporate governance systems; Stakeholder relationship management and long-term value creation

## Definition

The ability of a corporate governance approach, based on a wide vision of responsibility, on a modern interpretation of the links between the long-lasting company success and the equal composition of all stakeholders' interests, to facilitate the convergence in corporate governance systems; the changes that sustainability causes in the framework of rules and practices by which a board of directors ensures accountability, fairness, and transparency in relationship with all stakeholders, increasing the potential for value creation in the long run; and the trend to smooth out the differences in behavior that have long characterized outsider and insider corporate governance system due to the similar strategic approaches carried out by sustainable companies.

## Introduction: Sustainability and Corporate Governance

The corporate social responsibility and the sustainable development have recently emerged as relevant factors both for business and for the society. Firms have a key role in the realization of

economies geared to sustainable development. The recommendations and rules developed at international and national level promote the greater appreciation of the principles of social responsibility in business; however, the governance approaches adopted by the companies determine their effective implementation.

Several studies investigated the links between corporate governance structures and sustainability.

The corporate governance models existing worldwide are normative belief structures that determine the allocation of power in the firms. Based on the level of ownership dispersion, corporate governance systems can be classified as outsider systems or insider systems.

Highly dispersed ownership characterizes outsider or market-oriented systems: shareholders exercise control on managers' activities through their right to vote. Therefore, the high dispersion of share capital has long emphasized the shareholder view favoring frequently linking corporate success to the maximization of short-term profit, which is usually welcomed by the financial markets and generate approval for the board's decisions.

Concentrated ownership characterizes insider systems: such capital structure determines the possibility to exercise strong control on management in the long term for those who possess large shareholdings. The high concentration of capital and the frequent involvement of majority shareholders in management, often as members of the founding family and executives directors, orient the governance toward the maximization of the economic performance in the long run, with the aim to maintain and increase the corporate value.

The increasing awareness of sustainability concept has induced the adoption of a new approach by companies to deal with relevant stakeholders. The idea of stakeholder relationship management is recognized as a source of competitive advantage (Steurer et al. 2005; Salvioni and Astori 2013).

Sustainability is a long-term vision (Carroll 1999; Dahlsrud 2008; European Commission 2011) that refers to a concept of global corporate responsibility including legal, economic, social, and environmental dimensions (Salvioni 2003). This approach implies the balance of interests of all those who contribute to the current and future company's success, by means of a sustainable value creation that satisfies both shareholders and other stakeholders in the long term. Policies inspired to shared value, which involves creating economic value in a way that also creates value for society by addressing its needs and challenges (Porter and Kramer 2011), enhance the competitiveness of companies advancing, at the same time, the economic and social conditions of the communities where they operate, in a context where economics, social, and environmental dimensions nurture each other.

Therefore, when board of directors redefines the corporate priorities and goals according to the principles of sustainable development, they tend to overtake some traditional structural differences between outsider and insider corporate governance systems and to promote convergence paths. In this situation, the board of directors, entitled to set corporate goals and strategies in accordance with the need to balance the interests of all stakeholders, plays a key role for the development of the culture of sustainability throughout the entire organization, regardless of the corporate governance systems' specific characteristics (Salvioni et al. 2016).

## Convergence in Corporate Governance Systems: The State of the Art

According to several scholars, globalization of financial and product markets is nurturing a gradual path of convergence of corporate governance systems.

Someone prefers using the term hybridization of corporate governance systems instead of convergence to underline the simultaneous processes of continuity and change across national boundaries (Pieterse 1994). Others refer to a sort of paradox considering that mechanisms favoring divergence exist together with mechanisms favoring convergence (Lellapalli 2015). Moreover, the concept of path dependence (Schmidt and Spindler 2002) suggests that country's background influences the progressive process of

convergence. The scenario for convergence is very difficult to predict: that is, an insistent increase in diversity within an overall trend toward convergence (Clarke 2016).

The convergence between outsider and insider corporate governance systems can be observed in two aspects: the formal or de jure convergence and the substantial or de facto convergence (Coffee 1999; Gilson 2004; Yoshikawa and Rasheed 2009).

Convergence in form or de jure refers to the convergence of rules at international level. In several countries, corporate governance rules and regulations are submitted to changes. Prompted by the scale of the interests involved and by the role of national stock markets for the country's economy, self-regulation codes have been drafted, with the aim to adapt the conditions of transparency and effectiveness of listed companies to the new competitive requirements imposed by globalization (Salvioni 2008; Salvioni and Gennari 2014).

The growing wish of both investors and issuers to operate in global capital markets requires some degree of acceptance of high common values and standards. International bodies encourage convergence in both corporate governance principles and sustainability, considering the latter as a condition for sound governance in terms of risk management, cost reduction, and access to capital markets. At the same time, good governance nurtures trust in the economic system, because it is a condition for the development of the entire society and the environment. Empirical studies about convergence in corporate governance systems have existed for years, with the main focus on de jure aspects.

International organizations affirm principles of good governance that constitute an internationally shared framework. The most significant principles and guidelines are contained in the G20/OECD Principles of Corporate Governance (2015), the ILO Tripartite Declaration of Principles Concerning Multinational Enterprises and Social Policy (2014), the UN Global Compact publications, the green paper on The EU Corporate Governance Framework (2011), the ISO 26000 (2010), and many other EU recommendations, directives, and papers.

In this framework, many best practices of good governance exist, as country-based self-discipline codes and regulations. These best practices are coherent with principles and standards internationally shared, and this fact explains why the rules for effective corporate governance are rather similar even in countries with significant differences in corporate governance structures. Nevertheless, they follow the specific country's characteristics, and they are more subject to changes.

Therefore, it is quite improbable that one system might prevail on the others as optimal model, but it is plausible that some typical differences between outsider and insider systems can flag due to sharing of common rules.

Studies about convergence in function or de facto treat firms, instead of countries, as the unit of analysis and refer to the practices voluntarily adopted by the companies to be attractive on global markets underlining similar strategic approaches, regardless of the characteristics of country-specific corporate governance systems. However, they did not explicitly consider that the sustainability approach implemented by companies could either be a factor of substantial convergence or a potential incentive for formal convergence.

The two dimensions of convergence are very connected, influencing each other. De jure convergence tends to make some companies' choices uniform, stimulating de facto convergence. De facto convergence can prompt de jure convergence; this can happen in case of regulatory gap, when the companies autonomously adopt the existing best behaviors to deal with competitive pressure or in case of binding international guidelines (e.g., the ones into force in the EU) or great sensitivity to change by national legislators.

## Emerging Issues: Sustainability and Convergence in Corporate Governance Systems

Companies that pursue the same long-term sustainable value creation goals can promote a

gradual convergence of corporate governance systems, thanks to the board's commitment in sustainability.

The board of directors seems to be a potential factor of convergence from two perspectives. On the one hand, the board composition and responsibilities are intended to safeguard the stakeholders' interests, according to mandatory or self-regulatory rules: these rules derive from national and international standards of good, responsible, and sustainable corporate governance and make de jure convergence possible. On the other hand, the board's engagement in terms of corporate social responsibility leads to adopt sustainable development strategies based on stakeholder engagement and accountability, regardless of company's ownership, industrial sectors, and dimensions, promoting de facto convergence.

In fact, the board's commitment in sustainability matters (e.g., by means of the formal establishment of devoted committees and other organizational positions) helps going beyond the myopia caused by the pressure of short-term objectives and issues demanding immediate attention, and it sends a clear message to investors about the value creation in the future.

With regard to the first point, the adoption of sustainability strategies emphasizes the establishment of lasting positive relationships with all stakeholders, modifying the board's direction toward the maximization of economic performance in the long rather than short term. This should cause the overtaking of the traditional and limited short-term focus typical of outsider systems. Evidence suggests that the differences in the ownership structure characterizing outsider and insider systems (influencing the board's composition) do not assume a crucial role in the board's engagement in corporate sustainability (Ricart et al. 2005). This confirms that the sustainability approach adopted by the board of directors is not significantly affected by shareholders' short-term rent pressures, overtaking one of the traditional limits of outsider systems.

With regard to the relationship between company and its investors, researches confirm a growing interest in sustainability among mainstream investors (Unruh et al. 2016). Except for the founding families, the main shareholders, in insider as in outsider systems, are large and institutional investors, suggesting a positive relationship between institutional ownership and corporate social responsibility (CSR). CSR is considered the condition to minimize corporate risks and to obtain success in the medium-long term, so the attention of investors to long-run value creation can be a further point of convergence between insider and outsider systems.

Finally, the appreciation of board's commitment in sustainability can be deduced observing the length of top managers' presence in sustainable companies (Salvioni and Gennari 2014, 2016). In insider systems, a large percentage of executive directors hold their charge for many years as appointed by the majority shareholder. Vice versa, in outsider systems, generally, investors are not involved in management, and the term of office of directors is related to the consent of the property over time on board's work and results. The stable presence of executives and nonexecutives can state the guarantee for the continuity of corporate choices in a long-term vision, according to the principles of sustainable development.

It also seems appropriate to point out that a further tendency factor to sustainable governance consists of the increasing control activated by public authorities, or by recognized bodies, on corporate conduct and related social and environmental implications. The recent scandals (such as those of the automotive industry) have shown that the public awareness and recognition of the corporate sustainable development increase the external controls on products, processes, and business communications. This situation emphasizes the growth of corporate risk, when the economic, social, and environmental objectives are not properly integrated.

All these issues draw attention to a gradual path toward better governance structures that should nurture good governance practices reinforcing the link between formal and substantial convergence.

## Conclusion

The issue of convergence between corporate governance systems arises from the awareness that companies belonging to insider and outsider systems, and dealing with an increasing competition, do business in the same framework of principles of sound governance, and they tend to have similar conduct despite differences in their ownership structure and board composition. In such a dynamic world, the most critical success factor for a company is the capacity to create lasting and trust-based relations with its stakeholders, according to a long-term business orientation and value creation approach. This is the true spirit of any sustainable company, which affects its goals, strategies, and actions, regardless of its formal structure. Therefore, the convergence between insider and outsider corporate governance systems is evolving along a path where formal rules by international and national bodies and the external controls on sustainability on the one hand, and substantial approaches implemented by companies on the other hand, influence each other.

Empirical findings (Salvioni et al. 2016) show that the most sustainable companies in the world strive to balance the legitimate claims of different stakeholders in their decision-making processes; in this regard, no significant differences emerged for insider and outsider systems.

In this path of convergence between systems, the board's commitment to sustainability is crucial. In fact, the board of directors is the key driver for sharing the corporate culture in the entire organization, going beyond the logic of compliance toward a real passion for sustainability (Marlow et al. 2012). Sustainability is a governance approach that molds the company's identity, values, and organizational culture.

Sustainable companies are characterized by the same governance essence or spirit, irrespective of countries' specific corporate governance rules, institutions, and structures. However, the literature in the past has rarely considered sustainability as a factor of substantial convergence, mainly focusing on the convergence due to common legal framework.

International laws and guidelines can stimulate companies to act sustainably: in the future, this could even reduce the distance between corporate governance systems. However, a detached and mechanical compliance with the rules will probably be ineffective; vice versa, a shared awareness of sustainability as crucial for long-term company success is fundamental.

According to the idea that sustainability is a management point of view that can transform organizational culture, thanks also to the board's engagement, substantial paths of convergence can take place, despite structural differences in corporate governance.

In this context, the public policy making plays a central role in the promotion of corporate behaviors, both in terms of setting rules and in terms of promotion of corporate responsibility. This ensures that conduct failures are appropriately regulated, taking into account the integration between the different dimensions of sustainable development.

# Corporate Governance in Kazakhstan

Monowar Mahmood[1] and Zhanat Alimanov[2]
[1]Bang College of Business, KIMEP University, Almaty, Kazakhstan
[2]School of Law, KIMEP University, Almaty, Kazakhstan

C

## Introduction

Like other central Asian countries, corporate governance (CG) practices in Kazakhstan are still in their infancy. Transition from a socialist command economy to a capitalist free market economy, lax standards of practice, poor law enforcement capability, distorted or inaccurate stock market information, and a lack of qualified CG professionals are among the potential reasons for such governance conditions. However, the country needs to improve CG practices to ensure transparency and accountability of the board members and the top executives and ultimately to improve organizational performance and efficiency (Mahmood and Orazalin 2017). Developing better governance practices will enhance investors' trust in the publicly listed companies. Prior to the IPOs of large public sector organizations, these improved practices will help Kazakhstan's capital market to flourish, and people will buy shares of the public listed companies. Better governance practices will improve Kazakhstan's reputation as a country where businesses run fairly, as well as being a good governance indicator.

## Regulatory Framework of CG Practices in KZ: Current Scenario

CG is a mechanism to improve transparency and accountability of the top management. Boards of directors, top-level executives, and different stakeholders have significant roles in improving CG measures. Among various decision-

makers and policy-makers, the government of Kazakhstan, as the main regulator, plays the most significant role. To improve accountability and transparency in the financial sector, on January 1, 2004, the government established the Agency of the Republic of Kazakhstan for Regulation and Supervision of Financial Market and Financial Institutions (the "Agency") under the jurisdiction of the National Bank of Kazakhstan. As its first initiative, the Agency formed a working group consisting of members from the Agency, the Ministry of Economic and Budget Planning of the Republic of Kazakhstan, the US Department of Commerce, and the Association of Financiers of Kazakhstan to develop the Corporate Governance Code for the business organizations in Kazakhstan.

The current Code of Corporate Governance was adopted in 2005, and it was developed in accordance with the OECD's corporate governance principles. The OECD's corporate governance code was first published in May 1999 and revised in June 2004, originated from the "Report on the Observance of Standards and Codes of the World Bank Group." It provides guidelines in five broad areas, such as "The Rights of Shareholders and Key Ownership Functions," "The Equitable Treatment of Shareholders," "The Role of Stakeholders in Corporate Governance," "Disclosure and Transparency," and "The Responsibility of the Board." Based on OECD's corporate governance principles, the Code of CG of Kazakhstan identified seven basic principles to ensure fairness, honesty, responsibility, transparency, accountability, and professionalism for effective corporate governance practices. These principles are as follows: principle of protection of rights and interests of shareholders, principles of transparency and objectivity of disclosure of information on the company's activity, principles of legality and ethics, principles of effective dividend policy, principles of effective manpower policy, principles of environmental protection, and principles of policy of regulation of corporate conflicts. The principles were intended to provide guidelines to corporations, governments, stock exchanges, investors, and all other stakeholders to develop good CG practices with respect to social, economic, legal, institutional, and regulatory framework of the country (Code of Corporate governance dated February 21, 2005, Chapter 1).

In addition to developing the CG code, the Government of Kazakhstan also entrusted the Agency to control and supervise the different activities of the commercial banks, insurance companies, pension and investment funds, securities market entities, and credit bureaus, as well as the protection of rights of consumers of financial services. As part of its tasks, the "Agency" periodically recommends various legal measures to the Madjilis of the Parliament of the Republic of Kazakhstan to improve corporate governance, strengthen stock market infrastructure, and protect the interests of investors in the securities markets. Among those legal measures, the most prominent is a mandatory requirement for listed companies to adopt a Corporate Governance Code (Resolution # 106, dated March 26, 2005). To date, the Agency has implemented a number of measures to reform and improve state regulation and financial market supervision, along with creating an independent and effective system to consolidate financial supervision.

The Joint Stock Companies (JSC) Act of 2003 also acts as a catalyst for good corporate governance practices in Kazakhstan. The JSC Act proposes the following measures to improve corporate governance practices in joint stock companies of Kazakhstan:

- All JSC Board of Directors should form committees to oversee and be responsible for (1) strategic planning, (2) personnel and compensation, (3) internal auditing, (4) and social aspects (Amendment from 19.02.2007 and 28.12.2011, Art.53–1).
- Except the Chair of the Management Board, no one from the management will be allowed on the Board of Directors (BOD) of the Joint Stock Companies (19.02.2007 and 28.12.2011, Art. 54(4)).
- The Chair of Management Boards (CEO or GM) cannot be appointed as the Chair of the BOD (Amendments from 19.02.2007 and 28.12.2011, Art. 54(4)).

- The JSC board should consist of at least three members (Amendments from 19.02.2007 and 28.12.2011, Art. 54).
- At least one-third of the BOD members should be independent directors in the JSCs (Amendments from 19.02.2007 and 28.12.2011, Art. 54).

According to the JSC Act, all JSCs are required to follow some specific reporting and disclosure practices (Law on JSC dated May 13 2003 № 415-II, Art. 443). The JSCs are required to include major transactions on their annual financial statements and publish the annual reports in the mass media (Law on JSC dated May 13 2003 № 415-II, Art. 70(1)). They are also required to disclose information related to shares and stocks, major and interested party transactions, property pledges exceeding 5% of total assets, and participation in other company shareholding. In addition to annual reporting practices, JSCs are also required to submit reports to the National Bank on a semi-annual basis.

The government promulgated the law concerning the introduction of international financial reporting standards for all the joint stock companies in Kazakhstan since January 2005 (The Law of the Republic of Kazakhstan # 329-ii dated June 24, 2002). The joint stock companies in KZ are now moving from a three-digit Kazakhstan Accounting Standard to a four-digit coding from the International Financial Reporting Standards/International Accounting Standards (IFRS/IAS) and using different accounting groupings to maintain accounts and prepare financial reporting, balance sheets, income statements, etc., with IFRS/IAS standards. As KZ companies are adopting IFRS and IAS codes of practice, it could be seen as a step forward toward the convergence of international accounting and reporting practices (Kalyuzhnova and Nygaard 2008). Without a common accounting language for communication of financial information, KZ companies will be impaired when seeking or competing for available capital outside KZ, especially in the global capital markets. Cross-border investors will find it difficult to understand financial statements when companies use their respective national accounting and financial reporting standards. In another initiative, the National Bank of the Republic of Kazakhstan, the Ministry of Finance, the Agency, and the Association of Financiers established the Council of Issuers in February 2005. The Council of Issuers and the Council of the Association of Financiers approved the Corporate Governance Code on February 21, 2005 and March 31, 2005, respectively. The Association of Financers of Kazakhstan established a Centre of Corporate Governance in February 2006.

## Recommendations for Future Reforms

Though development of CG code could be seen as an important move to improve governance practices, it seems to identify some other priority areas, such as remuneration, risk management, board practices, exercise of shareholders' rights, etc., to meet new demands for improved checks and balances to cultivate sound governance practices in the post-financial crisis scenario. The existing code stipulates some recommendations, but the implementations are not spelled out in detail. However, a previous analysis has noted weaknesses in the board member nomination process, the guidelines for disclosure and transparency practices, and the accounting and financial reporting system (Johannesson et al. 2012). The code does not explain the qualifications of board members.

Different national contexts required different CG practices related to national culture, traditions, and institutional differences. However, the presence of multinationals and the emergence of international capital markets pushed for harmonization of accounting, auditing, and reporting practices across the nations. To improve the CG practices in KZ, lessons could be learned from the accounting and auditing reform in Kazakhstan. The accounting law of KZ was initially promulgated in 1995 and contained some 28 Kazakhstan accounting standards (KAS) similar to IFRS standards. However, over time, those KAS have changed, and since 2007, the government adopted a new accounting law considering the unique need

and institutional context of the country. The new accounting law consists of three-tier accounting and financial reporting systems for the businesses in Kazakhstan. The first-tier organizations, which are mainly microenterprises, need to apply simple tax-based rules; second-tier organizations, which include small and medium enterprises, are required to apply KAS standards; and third-tier enterprises, mainly the JSCs and public interest entities (PIEs), are required to apply IFRS and IAS practices. Such a similar system could be useful for promoting good governance in different sectors and different sizes of business organizations in Kazakhstan.

So far, only one CG code is developed and approved by the concerned authorities. However, within the national economy, different sectors operate with different business models; therefore, there should be different sets of CG codes for different industries. For example, due to the nature of the banking business, protection of depositors' interest and systematic risk need to be handled with more diligence than in other sectors. Therefore, different industry associations should take the initiative to develop or modify the existing code to meet the needs of respective industry stakeholders. The UK CG practices could be an exemplary model in this case, where eight different CG codes are in effect to provide one of the highest standards of CG among the global economies.

While KZ could further update CG codes, institutional support to implement those codes or rules is equally important. Without a proper enforcement mechanism, updating the CG codes will fail to bring the intended benefits. Moreover, CG practices could not be implemented in isolation from a range of other reforms related to micro- and macroeconomic, legal, and institutional systems. However, as reform is a cumulative process, one set of reforms underlies another, and reforms are sometimes implemented in parallel or sequentially, which adds up to a comprehensive program and long journey. Some internal measures could be taken. Internal stakeholders could appoint a designated third party to act impartially. The third party could accumulate all complaints, opinions, views, and wrong doing occurring within certain timeframe and submit the report to the company and other regulatory bodies.

Willingness to apply CG instruments is also important. Sometimes, unaccountable and opaque corporations can work to undermine and misinterpret the codes, thereby limiting their effectiveness, by creating and sustaining vicious circles of corruption, bribery, and mismanagement, which could have spillover effects on both private and public sector organizations. Different industry associations should encourage their member organizations to implement those codes of practices and promote more transparency and accountability in their governance practices.

The government could make it mandatory to prepare and publish a corporate governance report on a yearly basis. It should disclose and explain all the issues related to good governance practices and should follow some specific templates as prescribed by the government or law enforcing agency. In addition to penalty provisions, there could be some reward provisions for companies following and initiating better governance practices. Some independent authorities could be formed to assess the CG practices, and such assessment could be related with good rating systems.

There should be some penalty provision for the companies that do not comply with the CG code and principles and other stipulated legal measures. Such measures could be financial penalty, personal charges for the top managerial executives, delisting the company from the KASE, close observation of management for a given period during which the company would improve or implement certain practices, and/or reducing the company's financial flexibility.

## Conclusion

Recently, the government has undertaken initiatives to educate individual investors on stock trades and other collective investments for the economic and social development of the country (Resolution of the Government of Kazakhstan #822 dated August 25, 2006). This will

definitely help to improve CG practices in the long run. However, in addition to this initiative, the universities and other educational institutions could develop corporate governance related curricula to educated future generation of business managers. Additionally, they could provide training to media on corporate governance topics to raise awareness. The Ministry of Finance, the Agency, and the KASE should initiate training for government officials, corporate executives, accountants, and other professionals to understand the necessity of good governance practices and implement government directives and international standards to promote good governance practices in Kazakhstan. In case of a shortage of funding and lack of professional trainers, the government could request donor and multilateral agency assistance.

# Corporate Governance in the Local Public Services Sector: The Italian Case

Gabriele D'Alauro
Department of Economics and Business Studies, University of Genoa, Genoa, Italy

## Synonyms

Corporate structure; Corporatization; Liberalization; Management mechanisms; Municipally owned companies; Privatization; Public control; Public shareholders; Public utilities

## Definition

Corporate governance concerns the system of rules and practices through which a company is managed and controlled, so identifying the various relationships between corporate structure and management mechanisms. In the local public services sector, corporate governance of Italian firms has been significantly affected by the trend to corporatization and aggregation, showing the deep-seated propensity of the public shareholders to preserve their control also following stock exchange listing.

## Introduction

Since the 1990s, privatization and liberalization have led to growing competition within the Italian local public utility services market. This competitive pressure has contributed to the development of corporate strategies aimed at concentration, through alliances and aggregations between operators, in order to achieve various configurable synergies. In the context of these evolutionary paths, the incidence and role of corporate governance mechanisms, together with the sociopolitical and territorial demands of the players involved, are crucially important particularly for listed local public utilities. Stock exchange listing has significantly changed the overall nature of the companies, affecting both their corporate structure and management mechanisms, with consequent changes in the relations between various public and private stakeholders inevitably involved.

This chapter describes the features of the local public services and, with reference to the peculiar Italian context, analyzes the corporate governance of the firms operating in this sector in the light of the trend to corporatization and aggregation. With regard specifically to Italian listed local public utilities, a case study research analyzes the ownership structure, the presence of shareholders' agreements, and the impact of aggregations on effective corporate control and on relations between public shareholders.

## Municipal Corporatizations in the Italian Local Public Service Sector

Corporatization is the process through which governments or local public institutions create private companies for public service production or delivery, previously typically managed in-house or by public-law entities (Citroni, Lippi and Profeti 2015). Liberalization and privatization measures, such as corporatization, which have taken place in many OECD countries, have significantly reformed the Italian public sector and have particularly affected local public utilities' ownership structure and governance mechanisms.

More in general, local corporatization can be influenced by several factors, among them (Tavares 2017):

- Service and market characteristics, since municipal corporations can allow for gains of specialization and autonomy
- Institutional and regulatory settings, as corporations could offer more flexibility and autonomy in order to meet corresponding obligations and needs
- Political constraints, because local elected officials could consider that the creation of private-law companies may determine some loss of political control
- Financial conditions, as exposing local services to market competition could be a way to alleviate economic and fiscal stress, particularly when there are potential significant economies of scale and scope

Corporatization does not, however, necessarily automatically mean the sale of the new company's shares owned by the municipalities and consequently does not imply the substantial privatization of local public services.

This is certainly the case of Italy, where an analysis of the ownership structure of the large majority of Italian public utilities shows a deep-seated propensity of public shareholders, particularly municipalities, to hold onto their control (Bognetti and Robotti 2007; Cafferata 2010). So, as regards the sector of Italian local public service providers, this privatization, consisting in the progressive replacement of organizations governed by public law – in particular "*Azienda Municipalizzata*" and "*Azienda Speciale*" – with firms regulated by private law, in which both public and private actors theoretically can invest, often appears merely formal (Costantino 2011; Grossi and Reichard 2008; Monteduro 2014).

The main Italian municipalities, by adapting the corporate governance of the public utilities they already own, have been able to maintain corporate control even after the significant aggregations and stock exchange listings described below (Calabrò, Torchia and Ranalli 2013; Ricci and Landi 2010).

## Reasons for Public Utilities Aggregations

Privatization and liberalization processes have significantly contributed to increasing aggregation between entities operating in the local public services sector – a trend seen on one hand as an opportunity for dimensional growth offered by the new economic scenario while on the other as protection against the risk of losing pre-existing market shares due to increasing competitive pressures.

Particularly, it is possible to identify the following reasons and incentives for public utilities to carry out concentration operations (Gilardoni, Marangoni and Fontana 2006; Gilardoni, Carta and Arcudi 2012; Barbera, Guarini and Steccolini 2016):

- The achievement of economies of scale, due to the possibility of operating on more efficient dimensional levels as a result of the reduction in the average unit cost arising from the increase in the volumes managed
- The achievement of economies of purpose, represented by the economic advantages connected to the joint production of different goods and services through the use of the same production factors, in particular deriving from the centralization of common functions such as finance, personnel management, marketing, sales, etc.
- The achievement of economies of density, attributable to the reductions in the unit cost

(per served customer) that are obtained with the increase of the territorial concentration of the users, above all in the distribution phase with reference to the supply costs not only connected to main services but also to accessory services
- The achievement of economies of extension, i.e., economies linked to the simultaneous performance of several activities in the supply chain, having regard to the typical characteristics of the productive sectors of public utility services such as gas, electricity, and also the water cycle
- The achievement of dimensional synergies related to commercial activities, with regard to the development of customer knowledge management systems and customer relationships aimed at greater loyalty, as well as the expansion of the user base, through the offer of a wider and more integrated range of services (cross-selling), as well as an overall improvement in the quality of the services on offer
- The acquisition of a greater investment capacity, whose importance is progressively increased according to the needs that distinguish the public services sector
- The acquisition of know-how and the sharing of complementary skills, correlated in particular with technological convergence processes as well as actions for the rationalization of research and development activities
- The acquisition of greater bargaining power both with suppliers and with customers
- The defense against larger competitors, through an increase in public utilities' size in order to face more effectively growing competition also through the synergies and economies underlying the aggregation operation, as well as any international expansion
- Compliance with specific regulatory requirements, such as the minimum territorial areas required for participation in tenders for the granting of public service concessions
- Diversification, in particular with the entry into new business areas correlated with the core area in order to increase profitability levels and achieve a reduction in corporate overall risk also through a balanced presence of activities in regulated sectors and in sectors subject to free competition
- Increase in company overall value also in view of subsequent stock exchange listing operations, which occurred in the case of significant Italian local utilities

Importantly, as these synergistic effects are often difficult to isolate and weigh, their evaluation has to take into account the specific context of analysis and some critical aggregation issues, above all the role of corporate governance.

## The Critical Role of Corporate Governance in the Italian Case

Corporate governance mechanisms are among the most critical factors affecting aggregations between public utilities.

At the same time, reciprocally, the process of dimensional growth of public utilities has significant consequences and effects on governance: a significant one is to balance achieving the dimension that economies of scale require with the need for proximity to the territory, with the aim of protecting the public interest.

With specific reference to the Italian context of public utilities, the main elements to be taken into consideration in terms of corporate governance in the light of the peculiarities of public utility companies, in particular local ones, can be identified as follows (Martinez, Jamison and Tillmar 2013):

- Relationship between the interests of local communities and market needs
- Role of the political system, also with reference to the analysis of the incidence of possible interference on economic performance by municipalities that are shareholders of public utilities
- Procedures for defining the corporate structure, with particular regard to the composition of the shareholder structure and the presence of shareholders' agreements
- Degree of balance of powers in the corporate administrative bodies, having also in mind the

choice between the alternative governance models (traditional, monistic, and dualistic)
- Methods of exercising powers, with reference first of all to the appointment criteria and to the composition of the various corporate bodies
- Remuneration policies and characteristics of (in)stability of management
- Degree of representation within the corporate administrative bodies of the different categories of stakeholders (controlling shareholders and minority shareholders, management, employees, customers, suppliers, citizens, and institutions), as well as, in a broader sense, ways of involving them by public utilities
- Internal control system, including the assessment of social-environmental reporting tools, and external controls, extended to the analysis of the role of sector authorities

Overall, the analysis of the aforementioned corporate governance profiles has shown that the issue of the relationship between property and management has never been definitively resolved, highlighting the critical issues inherent in trying to achieve a fair and correct balance between managerial autonomy and political influence, and also underlining the possible heterogeneity between the governance system formally adopted by public utilities and the actual decision-making processes assumed (Abatecola and Poggesi 2010).

In this articulated context, it should be noted both the existence of significant conflicts of interest between (public) majority shareholders and minority shareholders, as well as between them and the corporate administrative bodies, and the considerable influence of the involved municipalities in the corporate decision-making process (Calabrò and Torchia 2011).

So, focusing the analysis on the relationship between corporate governance and firm integrations, the evolutionary path that has characterized Italian public utilities in recent years emerges as having had significant effects also on the subject of governance, due to the trend toward dimensional growth and to aggregations, the entry of international players, and the access of some companies to the capital market.

Significant issues related to this context may concern the possibility of politics influencing corporate governance. It is also important to consider the way the companies are set up: in addition to companies created through the replacement of organizations governed by public law, entities exist that have arisen from aggregations of several companies operating in different territorial areas. This involves the presence of a varied stock ownership, representative of the local communities of origin of the previous companies, so increasing corporate governance issues of the new public utility.

With reference to the various categories of companies operating in the public services sector, the issue of corporate governance assumes a particular significance for the listed local public utilities: entry into the stock market has strongly affected the characteristics of the companies, changing corporate structure, organization, management and operating mechanisms.

Some peculiar corporate features of listed Italian local public utilities are highlighted in Table 1.

These data show in particular that in all the companies – equal to six local public utilities listed at the end of 2018 – municipalities continue to exercise – directly or indirectly – control of the corresponding public utilities. This persists even after significant aggregation operations, which will be discussed later.

A significant role in maintaining control – besides strong limits on share ownership typically added in the articles of incorporation – is played by shareholders' agreements, which are present in all the cases (four out of six) where the local public institution of reference, individually considered, already does not own more than 50% of the share capital: the incidence of these shareholders' agreements appears significantly higher in the examined public services sector than in the other sectors of activity.

Shareholders' agreements, signed by several local public institutions, in most cases have as their object the composition of the corporate bodies, the regulation of the exercise of voting rights, the limits to the transfer of the company's shares, and the exercise of a dominant influence. In this

C

way, these agreements are essentially aimed at being able to jointly control the public utility, in order to achieve the stabilization of corporate structure and company governance, and – in case of aggregation – to maintain the centrality of the role played by each local public institution that already controlled the subsidiary public utility prior to unification.

In these contexts, however, there is the risk of creating aggregations without real leadership, where all decisions must be taken by all partners, with excessively long and complex decision-making processes and therefore not very effective organizational structures.

## Evidence of Typical Corporate Governance Mechanisms in Significant Italian Mergers

In the context of the different types of agreements and alliances that public utilities can undertake in order to pursue the objectives and results described above, the peculiar benefits connected to effective aggregation strategies, which allow for a good degree of integration among the different participants, have been highlighted.

Among the possible various types of aggregation, central and growing importance is represented by corporate mergers: mergers make it possible to capture intra-business synergies as intensively as possible in the various stages of the supply chains, heightening motivation for the overall improvement of company as well as determining an increase in the importance and value of the company considered as a whole.

In the Italian context, the realization of significant mergers between companies operating in the local public services sector has aimed to counter the growing intrusiveness of not only national but also international utilities, contrasting more significant regional groups.

The merger mechanism therefore offers the public utilities involved significant opportunities, by taking over, as a result of the corporate combination, a new entity, which can also operate in the various segments through specific special purpose companies, also based on the articulated sector regulations and in particular the unbundling provisions.

Notably, incorporation could determine the loss of public control previously exercised over the merged utility. To avoid this consequence, in light of the will of Italian municipalities to maintain control over the incorporated companies, a peculiar corporate governance mechanism has been implemented for the most significant mergers: the substantial formation of a joint venture, i.e., a solution whereby the parties that have joint control of the arrangement, which exists only when decisions about the relevant activities require the unanimous consent of the parties sharing control, have rights to the net assets of the arrangement.

The most significant Italian mergers were the three mergers between large listed public utilities that led to the birth of Iride S.p.A. in 2006, A2A S.p.A. in 2008, and Iren S.p.A. in 2010, respectively. All these operations resulted in post-merger entities under the joint control of the dominant public shareholders of the involved firms, due to corporate governance deals and agreements under which the majority shareholder of the merging company cannot alone determine the financial and management policies of the firm deriving from the business combination: as a consequence, according to the new provisions of the shareholders' agreements, decisions about the companies' activities require the unanimous consent of the public shareholders of both the involved utilities.

In particular:

- As to the incorporation that led to the birth of Iride S.p.A. in 2006, the operation resulted in a joint venture under the joint control of the Municipality of Genoa and of the Municipality of Turin, which were the public majority shareholders of the merged (Azienda Mediterranea Gas e Acqua S.p.A.) and the merging (AEM Torino S.p.A.) company, respectively; Iride S.p.A. was in turn incorporated by Iren S.p.A. in 2010.
- With reference to the A2A S.p.A. creation by merger in 2008, the transaction was based on a principle of equality of the Municipality of

Brescia (dominant shareholder of the incorporated company – ASM Brescia S.p.A. – prior to the merger) and the Municipality of Milan (already controlling incorporating firm – AEM S.p.A.); A2A is currently the largest Italian multiutility company, principally involved in the sectors of production, sale, and distribution of electricity; sale and distribution of gas; production, distribution, and sale of heating through district heating networks; waste management; integrated water cycle management.

- With regard to the incorporation that led to the birth of Iren S.p.A. in 2010, the merger, similarly to the previous two, resulted in a substantial joint venture, due to the willingness expressed by the parties to the business combination, which were the municipalities of Parma, Piacenza, and Reggio Emilia (dominant shareholders of the merged firm (Enia S.p.A.) prior to the operation) on the one hand and the municipalities of Genoa and Torino (already jointly controlling the merging company (Iride S.p.A.)) on the other hand – to adopt joint measures; Iren S.p.A. is currently the third largest Italian multiutility company, principally operating in the sectors of electricity (production, distribution and sale), gas (distribution and sale), the management of integrated water services, environmental services (collection and disposal of waste), and services for local authorities.

## Conclusion

With reference to Italy, a country characterized by a high level of control exerted by public institutions in the local service sector, the analysis, conducted through a case study research, has shown that corporatization processes have resulted in formal privatizations, where the large majority of local public utilities are still directly or indirectly owned by municipalities, in particular after significant cases of listing on the stock exchange.

In this context, corporate governance mechanisms play a key role, which peculiarly concerns ownership structure, limits of share ownership, and block and voting shareholders' agreements, in order to preserve the power of public shareholders.

This deep-seated propensity of the public shareholders to preserve their control has also affected the realization of significant public utilities aggregations, among which mergers have assumed increasing importance, as they are potentially capable of achieving the desired synergies with greater intensity. Considering that these mergers can have a strong effect on corporate management and ownership, due to the entry of new public shareholders, peculiar corporate governance mechanisms have been constructed by Italian public utilities, through the creation of substantial joint ventures arising from the business combination under the joint control of the main public shareholders involved.

It is hoped that these corporate governance structures will satisfy in the most effective possible way, on the one side, the public needs arising from the public and strategic nature of local services, and, on the other, the requirements of market competitiveness and successful running of firms.

# Corporate Governance Mechanisms and Developing Stock Exchange

Constantinos Chalevas, Afroditi Papadaki and Christos Tzovas
Department of Accounting and Finance, School of Business Administration, Athens University of Economics and Business, Athens, Greece

## Synonyms

Stock market; Capital market; Corporate administration; Corporate management & control

## Definition

Corporate governance is "the system by which companies are directed and controlled" (Cadbury Committee 1992).

Corporate governance involves a set of relationships between a company's management, its board, its shareholders, and other stakeholders (Organization for Economic Cooperation and Development, OECD 2015).

An exchange is a marketplace that deals in the buying and selling of stocks, bonds, commodities, derivatives, and other financial instruments.

## Introduction

Large corporations are usually characterized by dispersion of share capital ownership over a large number of shareholders. Due to this development, firms' management has become increasingly independent from shareholders while its effective control over firms' affairs has increased (Demsetz and Lehn 1985). A firm's management may pursue its own personal goals, even at the expense of the interests of the owners (Baker and Anderson 2010). Managers' aspirations for security, increased salaries, enhanced power, and prestige can prompt them to direct funds to operations and activities which do not necessarily contribute to the maximization of a firm's value (Saleem Sheikh 1995). These problems are more acute for smaller shareholders (noncontrolling shareholders), whose interests can be harmed, not only by management's actions but by board members' and larger shareholders' (controlling shareholders) actions as well (Christiansen and Koldestrova 2009; OECD 2015).

Corporate governance mechanisms have been introduced in many corporations in order to protect shareholders' interests. The corporate governance framework aims to protect and facilitate the exercise of shareholders' rights and ensure the equitable treatment of all shareholders (OECD 2015).

The first organized efforts for the establishment of a coherent set of principles of corporate governance took place during the 1980s by the

"American Law Institute" in 1984 and the "Treadway Commission" in 1987. The issue of the "Cadbury Report" in 1992 introduced new regulations concerning corporate governance, while the Organization for the Economic Coordination and Development (OECD) and the World Bank have made important contributions to the development of corporate governance principles. Additionally, the Sarbanes-Oxley Act in 2002 imposed a minimum level of financial disclosure on firms' management.

## Corporate Governance Mechanisms

The corporate governance theory proposes mechanisms to ensure that the rights of all shareholders are protected. These mechanisms can be classified in two categories: those that are imposed by the external environment of a firm and those which are developed within a corporation.

### External Environment Mechanisms

The competition in labor market for managerial skills can persuade managers to avoid value-reducing actions (Watts and Zimmerman 1986). This competition can be both external and internal. Assuming that the labor market is efficient, managers restrain from value-reducing actions in order to avoid unfavorable adjustments to their compensation. Besides, when the management of a firm is involved in value-reducing actions, this information eventually becomes known and their professional reputations will be impaired (Abdel-khalik 2003).

Competition within the firm may impose further restrictions on managers' behavior. Senior managers have strong incentives to examine and control the efficiency of subordinate managers, since the formers' compensation and promotion can be determined by their ability to adequately perform such a duty. Similarly, the subordinate managers are induced to monitor their superiors, since by doing so they enhance their prospects for promotion. Furthermore, the welfare of subordinate managers is affected by their superiors' value-reducing behavior, since the value of their human capital in the labor market is negatively affected by that behavior. Consequently, subordinate managers have an incentive to prevent their superiors from taking value-reducing actions (Baker and Anderson 2010).

The competition in the market for corporate control has been identified as a mechanism that can refrain top management from assuming value-reducing activities. In order to be effective, markets for corporate control should be allowed to function efficiently and in a transparent manner. Investors must be in position to understand their rights. Thus, the rules and procedures which regulate the acquisition of corporate control should be clearly articulated and disclosed to investors, while transactions should take place at transparent prices and under fair conditions (OECD 2015).

### Internal Mechanisms

The internal mechanisms can include incentives to managers and the imposition of control mechanisms.

#### Incentives to Managers

Bonus schemes and/or compensation plans constitute mechanisms that prompt professional managers to pursue policies that serve owners' interests (Chalevas 2011). By connecting managers' compensation with the performance of the company, as this is expressed by the level of its profits, the interests of shareholders and managers will be aligned (Jensen and Zimmerman 1985). However, firms' management may attempt to manipulate the reported earnings in order to increase their remuneration through accounting-number based bonus schemes and to secure their position in the firm (Paltrow 2002). In addition, when ownership of a firm's stock capital constitutes a substantial proportion of managers' personal wealth, managers have a personal interest in ensuring that value-reducing actions will be avoided. Assuming rational expectations, the market anticipates any opportunistic managerial behavior and discounts the value of the stock outstanding. Thus, managers bear the cost of a value-reducing action (Baker and Anderson 2010).

### Control Mechanisms

Shareholders usually assign the responsibility for the supervision of managers' conduct to the board of directors and to internal and external auditors. Directors and auditors are supposed to have access to any relevant information concerning a company's performance.

### Board of Directors

The board of directors has been recognized as a crucial corporate governance mechanism. The board of directors is supposed to safeguard shareholders' interests and the company's resources while it is accountable to firms' shareholders (Jensen 1993). Particular importance has been assigned to the structure and the size of the board of directors.

The participation of independent nonexecutive members in the board of directors ensures that a firm operates toward the maximization of shareholders' wealth. Independent nonexecutive directors are more likely to select the more competent managers and to remove an incompetent one CEO (Brown and Caylor 2004). The participation of independent nonexecutive directors can improve the decision-making procedure and increases the reliability of the published financial statements (Klein 2002). The CEO duality (i.e., the same person is the president of the board of directors and the CEO of the firm) is a factor that can influence the independence of the board of directors (Baker and Anderson 2010; Calcagno and Renneboog 2004). On the other hand, Donaldson and Davis (1991) support that CEO chair has a thorough knowledge of the firm's financial condition and as a consequence is in position to make decisions that improve the firm's performance.

With respect to the size of the board of directors, it has been argued that boards of directors with few members are more effective than larger boardrooms. On the other hand, when a board of directors has many members, an allocation of duties and responsibilities takes place. Consequently, the directors can monitor and control the management's actions more effectively (Donaldson and Davis 1991).

### Internal Audit Mechanisms

Internal audit mechanisms such as the internal audit department and the auditing committee (i.e., the directors that supervise the internal audit department) are crucial corporate governance mechanisms.

An internal audit regulation secures transparency in the company's operations and defines a framework of responsibilities for the company's governing bodies and departments, while by providing that certain procedures are applied for the evaluation of the firm's managers, it prompts executives to perform their tasks effectively.

The internal audit department is responsible for the implementation of the internal audit regulation. The internal audit department has the important function to continuously monitor the operations of each division and department of the company. In addition, the internal audit department is responsible for the detection of cases of conflict between shareholders and managers (Cohen et al. 2002).

The audit committee has the responsibility to review the financial statements. By doing so the audit committee supervises and promotes financial accountability. Furthermore, the audit committee ensures that firms' management develops reliable internal controls and that internal audit executes its duties adequately, while independent auditors examine and evaluate management and internal audit practices. The board of directors and the audit committee have the duty to monitor the assessments and recommendations of the independent and internal auditors. The board of directors and the audit committee should also ensure that the directors account for actions taken on these recommendations (IBGC 2015).

### Ownership Structure

The concentration of the ownership of the firm's share capital to a limited number of shareholders (block holders) facilitates the effective control of the management of a firm. Since block holders have made a considerable investment in a firm, they are expected to exercise a continuous control upon the management of the company, in order to ensure that the management's decisions lead to shareholders' wealth maximization (O'Sullivan 2000).

The institutional investors can exercise considerable influence upon the management of a company, since they control a substantial percentage of voting rights in the general meetings of the shareholders. In addition, the dominant position they hold in the financial markets allows institutional investors to influence the share price of firms (Ashbaugh-Skaife et al. 2006). It should be noted, however, that although the presence of a controlling shareholder can restrain the firm's management from value-reducing actions, a company's smaller shareholders may be abused by the controlling shareholders. It is very likely that controlling shareholders have a close relationship with the firm's management. Abusive self-dealing can occur when controlling shareholders exploit this relationship to the detriment of the company and other shareholders and investors (Christiansen and Koldestrova 2009; OECD 2015).

## Corporate Governance and Stock Exchange

### Traditional Role of Stock Exchanges and Current State of Affairs

Investors' confidence that the capital they provide will be protected from misuse or misappropriation by corporate managers, board members, or controlling shareholders is an important factor in the development and proper functioning of capital markets. The purpose of corporate governance mechanisms is to create an environment of trust, transparency, and accountability. The establishment of such an environment is a prerequisite for fostering long-term investment, financial stability, and business integrity, thereby supporting stronger growth (OECD 2015). The adoption of corporate governance principles by firms seems to enhance investors' protection feeling. It has been observed that in countries where the institutional framework for the investors' protection is fully developed, stock returns are higher, since when investors feel that their interests are adequately protected, they value a firm at a premium (La Porta et al. 2002). During the Asian market crisis, the companies that had exhibited the less volatile stock market behavior were those that had developed the most intergraded systems of corporate governance (Mitton 2002).

The introduction of corporate governance mechanisms can result in a decrease in the cost of the capital of a firm since these mechanisms allow potential investors to estimate the result of an investment with greater precision (Gordon 2002). Corporate governance mechanisms increase the transparency relating to the selection of investments' projects, making investors more willing to provide equity funds to corporations with a lower required rate of return (Walkner 2004). In addition, the implementation of corporate governance mechanisms may improve the creditworthiness of a firm. Corporate governance framework provides assurance to the providers of debt capital that the funds that they have invested in a particular company will be directed toward high-return projects. As a consequence, the firm's financial position will improve and the firm will meet its debt obligations without difficulty. Empirical evidence suggests that firms that have adopted corporate governance mechanisms have easier and less costly access to loan capital (La Porta et al. 1999).

At the same time, stock exchanges can play an important role in improving corporate governance. Stock exchanges can establish and enforce the application of requirements that relate to the corporate governance of both listed firms and firms aiming to enter a stock exchange. Besides, stock exchanges provide investors with the opportunity to express their attitude toward listed firms' corporate governance arrangements by allowing them to sell or buy listing firms' shares (IBGC 2015).

The importance of corporate governance mechanisms for the smooth functioning of capital markets is underlined by the fact that stock exchanges have been one of the main promoters of corporate governance recommendations for listed firms (OECD 2015). In addition, stock exchanges had a central role in the development of national corporate governance codes and recommendations. These codes address issues relating to minority shareholders' protection and equitable shareholders' treatment, disclosure

and transparency, and accountability and operation of board of directors and management. The corporate governance codes differ with respect to their scope and recommendations. In some instances, there are codes that are very comprehensive and provide detailed guidelines for their implementation (e.g., Belgian Code of Corporate Governance), while other codes are less comprehensive and provide fewer details regarding their implementation (Christiansen and Koldestrova 2009; OECD 2015).

With respect to their regulatory function, stock exchanges exercise this function within the context of the prevailing legal framework. Initially, the role of the stock exchange was restricted to issuing rules and clarifying aspects of the existing regulatory framework. Given that the corporate governance issues are already addressed by legal and/or securities regulation, the regulatory role of stock exchange is limited. Stock exchanges execute their regulatory role mostly through setting, listing, and disclosure standards relating to corporate governance. In addition, stock exchange monitors listed firm's compliance with these standards (Christiansen and Koldestrova 2009). The regulatory role of stock exchange varies across countries. In most European Union (EU) countries, corporate governance rules are mainly issued by capital market regulators within the framework of the national and EU legislation. As a consequence stock exchanges share the responsibility for the monitoring of compliance with disclosure requirements with regulatory and government authorities. In the USA and Canada, stock exchanges have retained some regulatory functions (mainly in the area of listing), while other regulatory functions have been delegated to nongovernmental regulators (Coglianese et al. 2004).

Although the level of compliance with corporate governance codes varies considerably across countries, we can discern two basic approaches regarding the compliance with corporate governance codes. According to the first approach, firms should provide a full disclosure of their corporate governance policies. The alternative approach is the "comply or explain" approach (Christiansen and Koldestrova 2009). According to this approach, listed firms may not comply with all the provisions of the code, but they should disclose this fact and the reasons for non-compliance. In this case the main monitoring function of the stock exchange is to ensure that the firm's disclosure is meaningful. The ability of the stock exchange to take enforcement action is confined upon the legal basis of the code and securities regulation that prevail in a country (Coglianese et al. 2004).

Practically, stock exchanges can enforce compliance only with those corporate governance standards that are included in the listing requirements. In addition, stock exchanges prompt firms which are already listed to comply with higher corporate governance standards.

## Recent Developments and Further Perspectives

The developments in stock exchange industry in the last 20 years have raised concerns regarding the role of stock exchanges as promoters of corporate governance mechanisms and recommendations. Besides it has been questioned whether stock exchange can continue to execute their regulation and enforcement functions effectively. Many stock exchanges have demutualized and become listed, while in many cases, they have been consolidated through mergers and acquisitions (Aggarwal 2002). The competition between stock exchanges has been intensified (Bagheri and Nakajima 2004). Moreover, stock exchanges face competition from alternative trading systems (ATS). Within this context, it has been argued that a conflict of interest may exist between regulatory duties of stock exchange and their for-profits actions. The intensification of competition between stock exchanges may have made them lower their regulatory standards in order to avoid deterring firms from listing and losing listed firms to competitors. Moreover, the reduction of stock exchange revenues due to competition by ATS means that stock exchanges have less sources available to adequately perform their regulatory responsibilities. Yet, the impact of these developments should not be exaggerated. The spread of ATS occurred during a period of increase in trading volumes, while the role of stock exchanges

continues to be an important one. Moreover, it has been argued that the regulatory function of stock exchanges may constitute their main competitive advantage against competition (Christiansen and Koldestrova 2009).

## Conclusions

The implementation of corporate governance principles and mechanisms is essential for the development and the smooth functioning of capital markets in general and stock markets in particular. By protecting shareholders' rights and interests, the corporate governance framework creates an environment of trust, transparency, and accountability, a prerequisite for the development of stock exchanges. Although recent developments in the stock exchange industry have raised doubts regarding stock exchanges role as corporate governance promoters, stock markets can still facilitate the improvement of existing corporate governance framework by establishing listing criteria for issuers and by closely monitoring the implementation of corporate governance principles by listed firms.

# Corporate Intrapreneurship: An Overview

Saleem Gul
Institute of Management Sciences,
Peshawar, Pakistan

## Synonyms

Intrapreneurship is synonymous with corporate entrepreneurship

## Definitions

Intrapreneurship is "entrepreneurship in existing organizations"

## Introduction

The term intrapreneurship implies the practice of entrepreneurship within existing organizations. Intrapreneurship is an important concept and an essential element in organizational growth and economic development. Intrapreneurship is considered as a driver of corporate innovation, although some have pronounced that it has had its 15 min of fame during the first wave of the entrepreneurial revolution during the 1980s (Harvard Management Update 1999). However, literature on intrapreneurship shows that with each succeeding wave, intrapreneurship too seems to have risen from the ashes. Early use of intrapreneurship focused on organizational revitalization and performance. However, as competitive landscapes change, businesses evolve, and intraorganizational dependencies alter, intrapreneurship too needs refocusing.

This chapter is an attempt to reinvigorate interest in intrapreneurship. The chapter is laid out in the following manner. The first section explicates the etymological origins of intrapreneurship and makes apparent its initial usage in the domain of management. The second section defines entrepreneurship, which is then followed by the definitional section of intrapreneurship. The reason for defining entrepreneurship first is because the term intrapreneurship is a cognate and, therefore, shall only make sense if we have a clearer definition and understanding of entrepreneurship. The fourth section brings to fore the constituent dimensions of intrapreneurship. This discussion is followed by a treatment of the impediments of intrapreneurship. The last section moves towards closing the chapter by offering a discussion on the value of intrapreneurship.

## Etymology and Origins of Intrapreneurship

The word intrapreneur is etymologically rooted in the term entrepreneur. The term entrepreneur itself is a mid-eighteenth century word, popularized by the French-Irish economist Jean-Baptiste Say, denoting a person who undertakes a project. Although now both an English and a French word, its origins are in the Latin *interprehendere*, corresponding with the French verb *entreprendre.* Entreprendre itself is a compound word and has war origins; it is comprised of the word *entre*, which means to swim out, and *prendes*, which means to grab (Evergreen 2012). Elsewhere, *entreprendre* has been described as a Middle Age verb meaning "to cover" (Boutillier and Uzunidis 2013), entrepreneurship means "to attack". Later evolutions of the term, specifically in the fifteenth century *entreprendre* came to mean "to come to grips with" and later "to challenge" or "to take risk." In the sixteenth century, the term entrepreneur took on an entirely different meaning, that is, of a contractor or supplier (Vérin

1982), implying a relationship founded on a contract. Thus, implying that an entrepreneur is someone who earns a fixed sum of money that is predefined in a contract, while taking on a financial risk (Cantillion 1755). Cantillion is attributed with establishing the entrepreneur as a "risk-taker." In other places, an entrepreneur is defined, much less gloriously, as someone who performs work (Savary des Bruslon 1723). The nature of the work is further classified into entrepreneurship related to "manufacturing" and entrepreneurship that results in a "building" of some sort.

Other languages too have their own terms encapsulating the behavior of an entrepreneur. In English, the use of the term Entrepreneurship implies to "undertake" or "adventurer" (Boutillier and Uzunidis 2013). Adventurer here implies a person who takes a chance or risks and wishes to control his destiny. Undertake simply implies to own and manage a business. It should be noted that "undertake" here by no means signifies starting a business but rather it is used in the sense of a manager. In the Chinese language, three ideograms signify entrepreneurship (Chan 2010). These are *qi* meaning "hope", *ye* meaning "enterprise", and *jia* meaning "master." Thus, becoming an entrepreneur here signifies an opportunity to become rich and influent, which is a shared notion with the Europeans.

In the Greek language, the word *epixeimatias* derived from *epixeiro* means to "come to terms with." Here the term is used for someone engaging in active behavior grounded in trust. In the Arabic language, an entrepreneur is called a *moukawel,* which is defined as someone who creates an enterprise or is a maker of projects (Boutillier and Uzunidis 2013), and someone who gives work via subcontracting (Vérin 1982).

In Russian, entrepreneur is denoted by the word *predprenimalted*, which is a translation from German, meaning to begin to do something responsibly (Boutillier and Uzunidis 2013). In Russia, there are three types of entrepreneurs based on their sector of activity, that is, sellers, buyers, and speculators. Boutillier and Uzunidis (ibid.)'s work goes on to show that globally entrepreneurship is always related to the diptych "risk" and "trust."

The word "intrapreneur" is a relatively recent invention. The first written use of the terms "intrapreneur," "intrapreneuring," and "intrapreneurship" simultaneously occurs in a single paper by Pinochot III and Pinochot (1978). Intrapreneurship is a condensation of "internal entrepreneurship" (Harvard Management Update 1999). Macrea (1982) credits Pinochot III with coining the word intrapreneurship. The American Heritage Dictionary (1992) also concurs that Pinochot III is the originator of the term, whereas Heller (1982) is credited as the first academic work on intrapreneurship.

## Defining Entrepreneurship

As discussed above, the word intrapreneurship is a cognate of entrepreneurship; therefore, the term entrepreneurship will be defined first, and this will be followed by a discussion on the definitions of intrapreneurship. This will set the groundwork for understanding the difference between entrepreneurship and intrapreneurship.

Entrepreneurship has been defined as the "process of doing something new and something different for the purpose of creating wealth for the individual and adding value to society" (Kao 1993). Although entrepreneurship has been practiced for much longer than it has had a label, its academic foundations can be traced back to the 1950s, where a few US and Japanese universities introduced small business management into their curriculums. It was not until the 1970–1990 period that entrepreneurship gained academic footing both as a means of an alternative career and also as a mechanism to revitalize the economy (ibid.). At present, entrepreneurship stands firmly between the Scylla of capitalism and the Charybdis of socialism.

Historical attempts, dating from 1730 to 1970, at defining entrepreneurship are captured by McMullan and Long (1990). These and other important definitions are provided in an adapted form of Kao's (1993) table, see Table 1. In addition to being initial attempts at defining entrepreneurship, these definitions also hint toward specific personality characteristics that typify

**Corporate Intrapreneurship: An Overview, Table 1** Historical definitions of entrepreneurship

|---|---|
| Richard Cantillion (1730) | Defines entrepreneurship as self-employment with uncertain return |
| Francois Quesnay (1759) | Defined entrepreneurial behavior as laissez-faire, *laissez-passer* lit. leave to make, leave to pass |
| Nicholas Baudeau (1767) | Describes entrepreneurship as innovative management |
| Jean-Baptiste Say (1810) | Describes an entrepreneur as an extraordinarily talented manager |
| Jeremy Benham (1818) | Developed the entrepreneur as a creative agent and linked compensation to performance through incentives |
| Carl Menger (1871) | Identifies the four stages of an entrepreneurial decision. He also goes on to define four types of entrepreneurial activities |
| Alfred Marshal (1890) | Suggests that there may be a difference between managers and entrepreneurs |
| Joseph Shumpeter (1910) | In describing an entrepreneur uses the terms innovator and carrying new combinations |
| Frank Knight | The courage to bear uncertainty |
| Edith Penrose | Suggests that managerial capacities should be distinguished from entrepreneurial capacity and that identifying and exploiting opportunistic ideas for the expansion of smaller enterprises are essential aspects of entrepreneurship |
| Harvey Lebenstein (1970) | Defines entrepreneurship as the reduction of organizational inefficiency and the simultaneous reversal of organizational entropy |

entrepreneurs, that is, independent, creative, enterprising, willing to take on risk, initiative taker, etc.

According to the modern theory of entrepreneurship, based on post-Schumpeter developments, the different definitions of entrepreneurship may be classified into two schools of thought (Landstrom 1999): the Harvard tradition and the human action tradition. The Harvard tradition, according to Landstrom (ibid.) views entrepreneurship as consisting of three dimensions: changes in economic system, creation of organizations for commercializing innovation, and profit creation through production and distribution of goods and services. The human action tradition is grounded in the work of Hayek and Mises (Landstrom 1999), and focuses on the exploitation of opportunities through human action and notion of using information dissymmetry to one's advantage. Mises argues that humans are not only calculating beings, but they also exploit opportunities through human action. Hayek, on the other hand, dealt with information dissymmetry in the market economy and the notation that individuals with special access can make use of their positions to their advantage.

Over time, scholars (mostly economists) in attempting to answer questions such as: What is an entrepreneur? What happens when they act? What effects do they have on the economy? have identified five entrepreneurial roles: as a risk-taker/risk manager, as a capitalist, as an innovator, as an alert seeker of opportunities (Kirzner 1973), and as a coordinator of limited resources (Casson 1982; Hebert and Link 1982). The work of identifying the characteristics of entrepreneurial behavior (headed primarily by Kizner and Casson) eventually led scholarship on entrepreneurship toward the behavior sciences, where researchers became more interested in skills, traits, or abilities of entrepreneurs (Landstrom 1999). The behavior science approach is segregated into two main traditions: the analytical approach, which seeks to identify the qualities of entrepreneurs; and the psychoanalytical approach, which focused on the effect of early experiences of entrepreneurs on their behavior. Entrepreneurial traits include traits such as moderate risk-taking, independence, results orientation, higher tolerance towards ambiguity and uncertainty, initiative, self-confidence, aggressiveness, ability to mobilize resources with efficiency, viewing money as a measure of performance, self-awareness, a tendency to trust other, innovators, leader, energetic, flexibility, optimistic, results-oriented, independent, and values such as aesthetic feelings and artistic qualities (Filion 1997). However, it should be noted that research on traits most often produced contradictory results, and it has proved difficult to establish a scientific profile of the traits of an entrepreneur (Filion 1997).

Other research on entrepreneurs has demonstrated that they are social beings impacted by their environment, affected by the period they are born and raised in, and their region and locality (Ellis 1983; Gibbs and Ritchie 1981; Julien and Marchesnay 1996).

Most researchers taking a psychoanalytical view of entrepreneurship assume that an analysis on the intrinsic qualities of entrepreneurs produces the best understanding of their behavior. These intrinsic qualities are the result of early life experiences (Ketz de Vries 1997). However, most scholars agree that there is no scientific personality profile of the entrepreneur that would allow for the identification of potential entrepreneurs with certainty. This should come as no surprise, as people are complex adaptive social entities and, therefore, it is difficult to predict their behavior with certainty and that understanding entrepreneurs requires a multidisciplinary perspective. Interestingly, contemporary literature on entrepreneurship accepts this idea and has started taking a multidisciplinary focus and expanded into disciplines including psychology, organizational behavior, business administration, interorganizational theory, population theory, sociology, social anthropology, and economics.

Peneder (2009) presents a modular reconstruction of the meaning of entrepreneurship that may be used to form a holistic definition of entrepreneurship. According to Peneder, entrepreneurship is the pursuit and exploitation of profit opportunities, requiring the use of behaviors such as taking judgmental decisions, creating new means, ends, or means-ends relationships, and exhibiting cognitive leadership. The entrepreneur does this by either equilibrating through market coordination and technology adoption or diffusion, or disequilibrating through innovation. The entrepreneur may do so in two roles, that is, as an independent entrepreneur or as a corporate entrepreneur (a concept pioneered by Burgelman (1983)).

## Defining Intrapreneurship

A simple and widely used definition of intrapreneurship is "entrepreneurship in existing organizations" (Antoncic and Hisrich 2003). Others have defined it variously, including: "a process by which individuals inside organizations pursue opportunities independent of the resources they currently control" (Stevenson and Jarillo 1990), as pursuing new ventures and opportunities while departing from traditional ways (Vesper 1990); as entrepreneurship within running organizations (Hisrich and Peters 1998); and as existing organizations creating new organizations within themselves, or as instigating renewal and innovation within that organization (Sharma and Chrisman 1999). Pinchot (1985) defines intrapreneurship as a bottom-up initiative of individual change makers having a goal of improving their organizations.

Although some difference in terminology exists within the literature (Sharma and Chrisman 1999; Chiristensen 2004), intrapreneurship is thought to have extended the idea of entrepreneurship by including corporate entrepreneurship, that is, entrepreneurship within established organizations (Martiarena 2013). Intrapreneurship is considered and promoted as a means of promoting the excitement and creativity of entrepreneurship to corporate workers, but with access to more resources and less risk (Corbett 2018). Literature on intrapreneurship is rife with examples promulgating the power of intrapreneurship. The most cited examples being Spencer Silver's Post-It notes at 3 M, which is perhaps balanced by the most cited example of the failure intrapreneurship in the form of Steven Sasson's invention of the digital camera at Kodak.

Neessen et al. (2019) posit that the terms "intrapreneurship" and "corporate entrepreneurship" pervade most definitional attempts at describing intrapreneurship from the perspective of the individual or organization. They further find that most definitions of intrapreneurship were from the organizational point of view, and concentrated around the idea of new businesses, products, and ventures. Garcia-Morales et al. (2014) describes intrapreneurship as "a process by which individuals inside an organization undertake new activities and depart from routines to pursue new opportunities." Those taking an individualistic perspective of intrapreneurship define it as:

"bottom-up proactive work-related initiatives of individual employees that are the driving force behind product development or improvement and/or market penetration" (Moriano et al. 2014). Other perspectives on intrapreneurship include a focus on corporations, while excluding smaller organizations (Shollhammer 1982; Burgelman 1983; Pinchot 1985; Rule and Irwin 1988; Kuratko et al. 1993). Others have limited the term to the formation of new ventures (Kanter and Richardson 1991; Badguerahanian and Abetti 1995).

Regardless of whether intrapreneurship is viewed from the perspective of an individual or organization, six common themes have been identified in the definitions. These are: (1) innovativeness and creation of new products/processes/services, (2) new business venturing, (3) self-renewal of the organization, (4) opportunity recognition and exploitation, (5) proactiveness, and (6) risk-taking (Neessen et al. 2019). The first three themes could be classified as the goals of intrapreneurship and the latter three as its characteristics. However, no single definition was found that integrates all six of the themes. Neessen et al. (ibid.) go on to propose a holistic definition and define intrapreneurship as "a process whereby employee(s) recognize and exploit opportunities by being innovative, proactive and by taking risks, in order for the organization to create new products, processes and services, initiate self-renewal or venture new businesses to enhance the competitiveness and performance of the organization."

## Intrapreneurial Dimensions

To better understand intrapreneurship, this section explores its content and characteristic dimensions. Organizational entrepreneurship or intrapreneurship can be classified into two streams, that is, the entrepreneurial approach (this includes innovativeness, proactiveness and risk-taking, autonomy, and competitive aggressiveness) and the corporate entrepreneurship (this includes intrapreneurship at the overall level of the organization) (Antonic and Hisrich 2003). Previous views on organizational-level entrepreneurship have been integrated into eight dimensions (ibid.): new ventures, new businesses, product/service innovativeness, process innovativeness, self-renewal, risk-taking, proactiveness, and competitive aggressiveness. For a summary of the intrapreneurial dimensions, see Table 2.

More recent research by Neessen et al. (2019) finds that intrapreneurial behavior is concentrated around the following dimensions, which occur consistently within the definitions of intrapreneurship: innovativeness and creativity, proactiveness, recognizing and exploiting opportunities, risk-taking, and

**Corporate Intrapreneurship: An Overview, Table 2** Summary of the intrapreneurial dimensions

| Intrapreneurial dimension | Brief explanation |
|---|---|
| New venture and new business | New venturing includes the formation of more formally autonomous or semiautonomous units or firms (Sharma and Chrisman 1999). New business refers to an existing organization entering new businesses without forming new organizational entities (Antonic and Hisrich 2003) |
| Product/service and process innovativeness | Intrapreneurship includes new product development or product improvement, new production methods and procedures (Shollhammer 1982) |
| Self-renewal | This dimension has strategic and organization change connotations and is reflective of organizational transformations through the renewal of key ideas on which organizations are built (Sharma and Chrisman 1999) |
| Risk-taking | Refers to quick pursuit of opportunities, fast commitment or resources and bold actions (Lumpkin 1998) |
| Proactiveness | Is expressed in anticipation of, and action taken, based on future needs (Lumpkin and Dess 1996) |
| Competitive aggressiveness | Refers to a firm's propensity to challenge its competitors (Lumpkin and Dess 1996) |

networking. If we align Neessen et al.'s (2019) dimensions with those of Antonic and Hisrich (2003), we find that Neessen et al. (2019) contains two new dimensions not included in Antonic and Hisrich (2003), that is, recognizing and exploiting opportunities and networking. Networking includes internal bonding networks, external bridging networks, boundary spanning networks, and scouting networks. Networking may also include social networking. Baczynska et al. (2016) posit that innovation requires recognizing opportunities and utilizing the available resources and knowledge to exploit these opportunities. However, such proactive behavior requires a certain amount of risk-taking. Sebora and Theerapatvong (2010) found that organizational support is an important factor in nurturing such behavior. This support has been found to come in the form of an organization taking the risk of allowing its employees to use its resources and an employee receiving a safety net in the form of a soft landing, that is, getting their old job back in the case of failure (Harvard Management Update 1999).

## Impediments and Drivers of Intrapreneurship

Impediments to intrapreneurship would include those things that inhibit intrapreneurship within an organizational context. Literature on intrapreneurship leans towards the idea that firms in general are reluctant to innovate. Those within the firms willing to pursue innovation often face difficulties as they do not receive the support needed in the form of spare time or access to resources. Three organizational-level impediments of intrapreneurship have been identified: systemic, behavioral, and political (Lumpkin 2012). These are explained next.

Systemic barriers stem from the overall organization including its structure and processes. Overburdened organizational systems become lethargic. This has been found to impede the flow of information (Kanter 1983), thereby reducing organizational learning (McGrath 1999). Excessive formalism within organizations has been found to create a resistance to change (Lawler and Yoon 1996). Such systemic barriers inhibit intrapreneurship even if there in a strong impetus within. Behavioral barriers such as biases or limited perspectives also affect intrapreneurship. Tucker (2002) mentions "silo thinking" as an example, that is, organizational members focusing on what they do without considering other function into consideration. Other contributing factors may not be related to behavior at all. Rather, the difficulty to break free from tradition, that is, organizational processes or patterns may be an impediment (Ghemawat and Costa 1993). Other forms of biases that impede intrapreneurship include cognitive biases, overconfidence, or representativeness bias. A willingness to act on biases or lack of information may also be an impediment. Other impediments include career risk and the threat of job loss. Political barriers include conflicts that limit intrapreneurial progress; these arise from power relationships and the dynamics of authority and control (Kanter 2003). Example reasons for conflict include managers' competing interest in projects, or struggle over who is possibly in command, or efforts directed at the reduction of costs.

Morris and Lewis (1995) identify environmental turbulence as a driver of intrapreneurship. They go on to identify three dimensions of the external environment: heterogeneity, dynamism, and hostility. Heterogeneity is thought to foster intrapreneurship as firms operating in heterogenous environments must deal aggressively with greater number of customer demands and tastes (Huse et al. 2005). However, excess dynamism in the environment can give rise to threats that previously did not exist; these may end up having a negative impact on the firm (Kathuria and Joshi 2007). Other external forces may create conditions threatening a firm's mission and output. Huse et al. (2005) argue that these hostile factors may reduce profitability thereby exerting added pressure for innovation.

## Value of Intrapreneurship

Intrapreneurship is valued within organizational contexts in different ways. This section outlines these different perspectives. Intrapreneurship has

been harkened as a solution to the complexities faced by organizations, which include organizational structure, resources, culture, and in some cases environmental factors including competition and customer demands (Baruah and Ward 2013). These complexities are enhanced by extraneous factors such as increasing globalization, technological changes, and improvements in living standards (ibid.). Agency problems and some possible solutions have been identified in intrapreneurial situations by Parker (2011). Intrapreneurship is seen as a mechanism of gaining competitive advantage (Bysted 2013). Fostering intrapreneurship within organizations would require improving the sharing of information between organizational members and improving communication, barring which firms will experience increased turnover (Morris et al. 2008).

Bysted and Jesperson (2013) argue that increasing innovative behavior at the workplace is a complex process that requires an internal climate which supports idea generation and its implementation. Furthermore, intrapreneurship is supported by the culture of the organization, such that it affords the intrapreneurs opportunities to explore new ideas, ventures, and projects while tolerating failures (Hornsby et al. 2002). Communication and trust are considered as playing a prominent role within culture, as these enable goal achievement (Scheepers 2011). Strong links between intrapreneurship and technological innovation have been identified by Camelo-ordaz et al. (2011).

Scheepers (2011) suggests that employees who perceive their job as challenging and rewarding are more motivated. People engaging in intrapreneurial activities are perceived as engaging in "job crafting" (Chamorro-Premuzic 2020), which he defines as making "your job more meaningful by aligning it with your interests and values." However, research shows that this works generally well for those who are "reward sensitive" (ibid.). Antoncic and Antoncic (2011) show that employee satisfaction, intrapreneurship, and firm growth are critically associated. Davis (2009) shows that job satisfaction, creativity, and knowledge creation are strongly linked. These have been found to lead to more innovation and improved performance (Bysted 2013). Scheepers (2011) argues that an environment where there is formal acknowledgment and encouragement of skills and talents, where financial resources are provided, and employees are given freedom to experiment are conducive to intrapreneurship.

Intrapreneurship is a hallmark of paradigm-breaking companies, leading to innovation in products, services, and processes, and exceptional performance (Mohanty 2006). Intrapreneurship has been found to increase profitability and innovativeness, strategic renewal and performance, and international success. Additionally, firms that align themselves for intrapreneurship are more likely to achieve higher growth and profitability than those who do not (Antoncic 2007).

## Conclusion

This chapter provided an overview of intrapreneurship, moving from the origins of the discipline to its value. Intrapreneurship was and remains an important area of research and still holds tremendous value for organizations (regardless of their size). Changing organizational structures, ways of doing business, and evolving competitive landscapes will create new approaches and uses of intrapreneurship. Moreover, intrapreneurship is one of the ways through which organizations would be able to remain competitive, relevant, and attractive to investors.

## Synonyms

Social Responsiveness

## Definition

The term "corporate social responsibility" (CSR) has a long and complex history. Today, it stands as a theory- and practice-based dialogic space that is still indefinite and perhaps indefinable, where a company's commitment is conceived and carried out on the basis of a given value system.

Although it is difficult for the concept to find a precise time allocation, CSR dates back to the 1950s and to the first scientific assumptions concerning entrepreneurs, managers, and businessmen (Bowen 1953). However, the assumption that the economic action generates higher responsibilities or implies moral and economic obligations is, with no doubt, an ancient idea that lies at the basis of any entrepreneurial initiative. This postulation derives from the fact that the firm is, in substance, a human implant. In other words, it is a man's tool used in the economic field as well as a particular type of organization enabling the

satisfaction of men's needs within the society which, at turns, allows the creation of other communities.

The concept of CSR implies the awareness that, from one side, whatever economic activity is carried out, the latter is to produce results and consequences, which are not necessarily economic in their nature, upon individuals and people's lives. From the other side, it stands the awareness that there are specific moral obligations that firm behavior should take into account, which go beyond current laws and norms and contribute pursuing directly and achieving objectives beyond purely financial interests.

Contrariwise to laws, the morale has not a sanctionary nature, and, therefore, every attempt to define the firm within a framework, which is not only economic, has always confronted with several difficulties leaving it as an abstract concept trapped between conflicts of interest and normative interpretations (Cary 1969).

The existence of different conceptualizations about the term CSR, which have abounded in the literature, has progressively emphasized on a particular aspect. Among those it would be relevant at this point to cite the following (Zenisek 1979; Carroll 1999; Campbell 2007; Dahlsrud 2008; Ghobadian et al. 2015): the vagueness of the concept itself (Davis 1960); the importance of public satisfaction (Frederick 1960); the intimate relationship between the firm and the society/community (Walton 1967); the firms' multiple interests and objectives to pursue (Johnson 1971); the philosophical vision and the long-term vision that the approach implies (Steiner 1971); the voluntary basis of a socially responsible behavior that is conducted (Manne and Wallich 1972; Jones 1980); the relevance and the size of social performances (Backman 1975; Sethi 1975; Carroll 1979); the preference for a concept which is more oriented toward public responsibility (Preston and Post 1975); the vision viewed as a process rather than a set of results or principles (Jones 1980); the compatibility between profitability and responsibility (Freeman 1984; Freeman et al. 2010; Aupperle et al. 1985; Rowely and Berman 2000; Walsh et al. 2003); the possible paradigm changes and reference to the concept of sustainability (Bruntland 1987; Van Marrewijk 2003; Montiel 2008); the correlation between responsibility and maximization of the firms' economic value and the sharing of those values themselves (Porter and Kramer 2011); the results that are analyzed in terms of human resources' motivations (Bruce et al. 2015).

All the above definitions and theoretical assumptions have altogether attempted to improve acknowledging the concept of CSR and, above all, its phenomenology, which remains a wide and complex subject confronting itself with issues concerning the nature of the firm itself and the individual.

## The Role of CSR

It is worth to focus on the nature of the firm which is not a machine, neither a closed organization nor a deterministic system. Rather, it has to be conceived as an open and probabilistic entity that is a well-defined system made of individuals and things. Its human nature – meaning that the firm is "generated by men" – characterizes it as a quasi-thing or an almost animate thing.

The firm, in fact, owns its own subjectivity, which is complex and, perhaps, not perfect; it is for this reason that it is also endowed with responsibility. As a responsible entity, it is also characterized by its own moral power, which should not be confused with the ethical sphere.

It is more probable that it is just the effort or the tension toward ethical issues (being truthful for some and false for others), that is, the attempt to search for an ultimate good through a powerful effort of courage. This leads to imagine the firm as what a human organization is not and it cannot be an engine or a generator of happiness only.

It would be important to remind that the morale generates from a necessity (e.g., a given culture, i.e., a given set of customs) and represents a reaction to an emerging need.

Ethics, instead, generates from the sphere of desire and constitutes an unphysical space where a man acts through the elaboration of senses in the attempt to discern new borders beyond the existing morale. Economics itself, being a

human modus, is a moral modality and cannot be considered as an ethical modus in the meaning which refers above. To this standpoint, it could be argued a firm is an entity that lives because of the continuous exchanges with other subjects, individuals, and behavior – as it requires knowledge, intellect, and willingness – who are, at turn, subjected to considerations and interpretations based on moral grounds.

On the above premises, it could be argued that a firm is not socially responsible when, assuming that the conducted behavior is licit and not against the law, the behavior itself is practically in contrast with shared common values and human action's fundamental rights as well as with the interests of the community and the environment where it operates.

This occurs every time the firm, in the pursuit of the economic benefits being at its own exclusive advantage, does not consider the existence of effects which would compromise a peaceful survival of the society, its surrounding environment, and, ultimately, the firm itself (Campbell 2007). In the case when there is an illicit purpose or the aim of to pursue is a premise for further and future illegal activities, the firm is to be considered as criminal, and, on these grounds, it is superfluous to make any considerations on social responsibility's related issues.

The firm is an instrument enabling to generate profit and create wealth, but before that, it is a spontaneous community and an occasion for men's aggregation.

As it has previously observed, the aim of a firm is not only to make profit. Profit regulates the life of the firm itself, but it is not the only factor since other human factors need to be added which, in the long run, are also essential for the firm's lifetime. Of course, it is worthwhile to question that parameters, performance, and objectives have to be considered in order to evaluate and appreciate the social behavior that a firm upholds.

The scientific literature added to entrepreneurial practice have, in any case, selected the areas and the big topics of interests among the streamline of social responsibility: among the first lot, there are the care and the respect of the environment, the support of civil progress, and the respect of and the promotion of fundamental human rights; among the second, it is possible to count for the psychophysical well-being of the personnel, health and safety of products and production, loyalty toward the public sector, and regulating actors (Carroll 1979).

Today, it is possible to consider a product or a production as innovative only if they are sustainable under the social and environmental rubric. The concept of innovation itself, then, should always imply a certain level of social responsibility. The public sector could provide significant input on this subject having consolidated the aspects of social responsibility while performing functions and tasks even though they are compromised by the degenerative interference of political power, by the (ab)use of power and by the functioning and measurement models which are not always adequate and rational (Bailey 1964; Cohen and Eimicke 1995; Frederickson and Ghere 2013). It is sufficient to think of corruption and clientele-based phenomena being, with no doubts, socially irresponsible leading to the destruction of the public value (or its regeneration) and placing recovery efforts at risks (Esposito and Ricci 2015). Unfortunately, some entrepreneurial experiences or practices go together with a wrong vision of the public good and the public sector by generating what is recognized today as crony capitalism (Hughes 1999).

Nevertheless, the social function of the firm is not easily and immediately and objectively measured, and there is a high risk of moving from business ethics to business of ethics.

In the firms, the issue of measurement is central and takes a renewed stake in the direction of social and environmental themes.

In any case, here come as evident the necessity of a twofold attempt: the firm must open itself by maturing a less opportunistic and opportunistic culture, and, at the same time, its interlocutors must define their own interests while reconsidering the wider and more complex economic motivations of the entrepreneurial systems, as well. Such a social integration conducted by the firm (Porter and Kramer 2002, 2006) is, nevertheless, possible only through a process of authentic maturation of those social and ethical principles, being generally shared, by means of a truthful assimilation of social responsibility-related issues.

These are values which are able to permeate concretely with no dangerous infringements. A mature social responsibility should also be able to overcome the idea that higher costs resulting from a social integration are widely recuperated from future profits and utilities that could derive. In practice, a merely utilitaristic consideration of CSR could be dangerous and risky to wreck into the realm of conveniences and opportunities.

The remarkable recent unfortunate experiences and scandals of capitalism – it is worth to recall also the dramatic accidents that occurred in several factories or the air and train disasters which are the result of a certain way of understating the life of the firm – have improperly shaken the public opinion. Moreover, if it is true that capitalism is made of alternating periods of development and crisis, and the mankind is made of saturated and greedy individuals, it becomes necessary to think about and consider those issues which do not seem that contingent but merely paradigmatic.

Among those there is the assumption to move from the logic of improving the mere entrepreneurial reputation that is closer to the idea of the brand dissemination among the market's consumers to the logic of defending the human dignity. The latter is proper of the individual acknowledgment and awareness of values and which value would enable the generation of wealth and profit without compromising the community and the environment while avoiding hypocritical and superficial activities (Cho et al. 2015).

Within the vision of building a geometry of well-being (De Finetti 1937) or a well-being economy, there is the attempt to reconcile efficiency and fairness contrary to the Paretan optimum which advocates that the firm's responsible action is driven by the continuous search of a responsible trade-off between efficiency and fairness, the respect of individual liberties and the fundamental human rights, the respect of human action's moral sentiments, and the firm economic subject's liberty to action that is necessary to ensure the respect of the minimum standard laws regulating the civil coexistence (Smith 1776) not damaged by the mere pursuit of individual interests.

All the rest has to be considered as an impediment to others' liberty which would otherwise be eroded by the single individual's decision and liberty (Kant 1793) so that it would be an impediment to the automatic fulfillment of happiness and responsible well-being of the community (Smith 1776) to which we all belong, including those who are driven by the mere achievement of profit optimization and personal efficiency, conducted in a responsible or irresponsible way, with conscience or unconsciously at the expenses of common liberties, fairness, and efficiency for all (O'Sullivan et al. 2015).

The role of CSR also moves through other important considerations.

The jurisprudential assumption affirms that CSR cannot always contain the ethical dimension of the entrepreneurial behavior. This is due to some limitations such as the fast evolution of markets and products and their physiognomies as well as the fast pace with which entrepreneurial behavior changes so far to impede constant and adequate legal adjustments, especially in the perspective of an ever borderless and globalized economy.

The other consideration focuses on the conditions of the system that the public sector must ensure to all. The private economic initiative is free only when all conditions to start, conduct, and conclude an economic activity practically exist altogether. By this perspective, some factors play a decisive role such as the quality of the public services delivered, the level of the necessary infrastructures, the efficiency and effectiveness of the normative system, the extent of the public order, the capacity of control, the sanctionary effectiveness, the rule of law, etc.

The third consideration is on deregulation processes which have recently produced, in the Western capitalistic cultures, phenomena of de-responsabilization.

It appears quite evident, then, that the state must develop systems aiming at controlling the private economic initiative which should not be overshadowing or suffocating, rather simple and effective in order to really influence irresponsible behavior.

The fourth consideration refers to the high level of citizens' schooling (a citizen considered

as a worker, a tax payer, a patient, a voter, a user, an investor). The latter appears to be, today, more sensitive, conscious, and more demanding in terms of information supply, but it is not for these purposes that the citizens stand as stronger vis-à-vis the relationships created with the firm.

With good reason, the information between the firm and the stakeholder should be upgraded and enriched in a wider and safer cultural framework based on an accountable relationship (Gray et al. 1987). The sole economic and financial communication is considered as fully inadequate. It is necessary to make use of innovative communication tools able to take into account noneconomic and social performances inspired by the following principles:

- Utility
- Transparency
- Clarity
- Participation

Only the use of a transparent and adequate communication which is useful to the cognitive needs of the recipients, since it would not be hypocritically built, can coherently contribute to improve the behavior in a socially responsible view of the firm itself, while ensuring a real participation to the firm's life.

## Conclusion

It is possible to conclude, therefore, that a firm's economic subject who conducts a socially responsible behavior is directly influenced by the value of the entrepreneurial system as a whole and by the capacity to pursue those values that, regardless of eventual contingencies, are nurtured by the following factors:

- The awareness of the existence of a framework of dependence and reciprocity-based relationships between the firm, the society, and the natural environment
- The importance of trust as an indispensable sentiment for the survival of the firm itself in the long run
- The refusal of those phenomena leading to the absolutization of the profit or other final economic and financial results
- The achievement of the trade-off between efficiency and fairness having in mind the responsible respect of the common liberties that the actors engaged in the decision-making enjoy
- The strategic and long-term vision

In any case, CSR should not be confused with purely philanthropic behavior or with charity activities that support economically and socially disadvantaged people. By the same token, activities of reporting and accountability toward stakeholders should not be considered as exhaustive with respect to those commitments and obligations having a social nature.

It would be important, at this stage, to refer to John Maynard Keynes's argument on the significance to the extent that it could contribute to acknowledge that the lack of social responsibility leads to several risks:

> We destroy the beauty of the countryside because the inappropriate splendours of nature have no economic value. We are capable of shutting off the sun and the stars because they do not pay a dividend. (Keynes 1933: 755)

# Corporate Social Responsibility in Developing Countries

Moustafa Abdelmotaleb
Business Administration Department, Faculty of Commerce, Assiut University, Assiut, Egypt

## Synonyms

CSR; Egypt; Employee behaviors; Internal stakeholders; Public sector; Public service motivation

## Definition

According to the World Business Council for Sustainable Development, corporate social responsibility (CSR) is "the continuing commitment by business to contribute to economic development while improving the quality of life of the workforce as well as of the community and society at large."

## Introduction

CSR has been researched since it was proposed about half a century ago. Topics of CSR in research include theories, models, concepts, and relevant themes. The concept of CSR has been accepted as obligations imposed by societal expectations for guiding business behaviors. Although academic research has discussed the concept of CSR for many decades, there is no single definition of the concept that everybody agrees. Bowen (1953, p. 41) put the initial definition of CSR as "the obligation of businessmen to pursue those policies, to the make of those decisions or to follow those lines of actions which are desirable in terms of objectives and values of our society". He defines CSR as the policies, the decisions, and the actions that align with the goals and values of society. Later, researchers distinguished between the internal and the external aspect of CSR. Internal CSR refers to CSR actions toward internal stakeholders (e.g., employees groups), specifically addresses the employees' needs and well-being inside the organization, whereas external CSR refers to CSR actions toward external stakeholders including customers, community, governments, and any other external organization and individuals. Employees' perceptions of internal and external CSR combined that shapes their overall perceptions of the level of responsibility of an organization. Definitions proposed in recent times stressed the integrated conceptualization of CSR that includes all stakeholders. Even though there is no consensus on a universal definition and dimension of organization's CSR, the substance of the concept is consistent, with organizational activities and status related to the organization's societal and stakeholder obligations.

## Benefits of CSR

Based on the findings of previous research work in CSR in developed economies, organizations that value CSR stand the chance of having the following advantages:

- Better public image: In a study examining the effects of CSR on corporate identity, image, and the firm performance in a multi-industry setting, Arendt and Brettel (2010) found that CSR triggers the corporate-image-building process, which in turn have a positive relationship to organization success. An organization's reputation is built and maintained by fulfilling the expectations of multiple stakeholders. Organizations that show their commitment to various causes are perceived as less selfish than organizations whose CSR actions are nonexistent. By publicizing their efforts and letting the general public know about their philanthropy, organizations increase their chances of becoming favorable in the eyes of various stakeholders.
- Attract and retain investors: Risk is reduced when organizations understand stakeholder concerns. According to a survey done by "Blue & Green Tomorrow" (2013), 90% of investors say corporate social responsibilities and sustainability reports are essential. It has been reported that investors see a relationship between CSR and risk mitigation. Investors consider CSR strategies and activities to be a part of the comprehensive approach to risk management in the organization. It could be expected that the perception of CSR as a tool mitigating business risk of companies will become more relevant for investors as the number of organizations which implement CSR initiatives as a part of business strategies grows. The growth of the number of organizations which fulfill CSR standards and CSR reports will contribute to a wider perception of CSR activities as a factor in mitigating

and, more generally, managing business risks and improving the attractiveness of companies to investors.

– Competitiveness and market positioning: In recent times, customers as a stakeholder enquire about the CSR performance of organizations and tend to be loyal to those corporations with a good record of social responsibility. There is evidence that organization's CSR performance encourages customers to perceive the organizations more favorably. A study done by Sen and Bhattacharya (2001) found a positive relationship between organization's CSR actions and consumers' positive attitudes toward that organization. Chung et al. (2015) examined the impact of CSR perceptions on customer satisfaction and loyalty of 276 customers in China. They found that there is a positive relationship between customer perception of organization's CSR and customer satisfaction and loyalty. In the marketing literature, customer satisfaction has been recognized as an important part of corporate strategy and a key driver of organization long-term profitability and market value.
– Positive work environment: While there are many ways for organizations to foster enjoyable work environment, one way is to create a strong sense of CSR. When organizations exhibit voluntary behavior to external stakeholders and the society at large (i.e., external CSR), they are more likely to provide employees with a positive workplace (i.e., internal CSR). Positive workplaces reinforce job-related attitudes and behavioral outcomes. Instilling a strong sense of CSR within every employee from the top down will help creating a positive productive environment where employees can grow and thrive.
– Increase in creativity: Employee creativity is high when employees come up with original, relevant, and useful products, ideas, or processes. Recently, a number of studies attempt to explore the potential link between organization's CSR efforts and employee creativity. Brammer et al. (2015) found in their study of employees working in a Spanish multinational corporation in the telecommunications sector found that there is a positive relationship between CSR perceptions and employee creativity. The results of their study also revealed that employee organizational identification played as a mediator variable in this positive relationship. Employees who perceive that their organization is committed to bettering the local and global communities are more likely to maintain a stronger connection to the organization. Because of this deep connection that employees share with their organization, employees feel more inclined to be productive and creative. In other words, by incorporating comprehensive CSR programs, organizations can help employees become more productive and creative.

## CSR in Developing Countries

Limited attention has been given to exploring the implications of organization's CSR efforts in developing countries. It has been suggested that CSR is more important in developing countries because lower amount of social provision is available in these countries as compared to the developed countries in the West. By far the majority of studies on Corporate Social Responsibility are still embedded in the economic, cultural, and organizational context of the West. Thus, we need to know the current state of affairs concerning corporate social responsibility in some of the developing countries.

Egypt is a developing country that has been going through a great deal of turmoil and social evolution. We do not know the state of corporate social responsibility in Egypt. It is also not known how corporate social responsibility shown by public and private corporations in the country does impact upon work behaviors of employee groups in Egypt. Such information is vital to the social and economic development of Egypt. This chapter, therefore, adds to the available academic body of CSR literature by focusing on the implications of organization's CSR efforts in Egypt as a developing country.

Culture is important in understanding CSR. Culture includes not only the ongoing practices and behaviors within an organization or region

but also the values and strongly held beliefs of how individuals expect their culture to be. Social-cultural and ethical-legal approaches have a fundamental role in the promotion of CSR and the social responsibilities understood by organizations. The Egyptian culture is classified as being collectivistic in context with moderate levels of masculinity. People with high score on collectivism assume that they are highly interdependent with the organization and believe it is important to make personal sacrifices to fulfill their obligations toward organizations they work for.

Recently, the findings of some qualitative research conducted in the Middle East and North Africa region (e.g., Ibrahim 2015) revealed that the Egyptian cultural heritage shapes the predominant cultural values that govern relationships inside organizations and influence social commitment. Persuaded by the findings, the author believes that such influences would impact work-related values as well as the CSR orientations adopted by organizations working in Egypt. The following section will shed some light on the influence of CSR orientations (i.e., internal and external aspects of CSR) upon internal stakeholder's attitudes and behaviors. Research findings focusing upon CSR perceptions of public sector employees working in Egypt as reported below had utilized an individual level of analysis for conducting the research investigations. The research could be considered as exploratory in nature to show the state of the art in CSR research in a developing country context.

## CSR Perceptions and Public Sector Employees

Most of the Western studies that focus upon CSR-employee outcomes have been conducted in the private sector organizations of those countries. Limited attention has been paid to the perception of public sector employees regarding corporate social responsibility. Accordingly, this chapter will throw light on some results of recently published research papers on the relationship between perceived CSR (i.e., internal and external CSR) and employee behavior in public sector organizations in developing countries.

A recent study conducted on a sample employees working in public banks in Egypt found that both perceived internal and external CSR initiatives have significant positive relationships with public service motivation (PSM) (Abdelmotaleb and Saha 2018). Thus, positive perception of CSR held by an employee produces strong motivation to serve the public. The findings from the study provides support for the assumptions underlying pro-social motivation theory that postulates that employees are more likely to be pro-socially motivated when organizations support collectivistic (i.e., external CSR) rather than individualistic norms and practices (Grant and Berg 2010). This finding also provides support to the process theory of PSM, which propose that organizational factors (i.e., internal CSR practices) will shape employees' desire to serve the public.

According to the results from the study conducted by Abdelmotaleb and Saha (2018), employees with higher levels of PSM will be willing to perform above and beyond what is expected of them. Based on this result, the author suggests that, when hiring new employees, managers should pursue those individuals who actually have the desire to serve the public. Also, in the selection stage, managers need to examine applicants with the perspective of public service motivation. To retain employees with high level of PSM, managers should commit to create a supportive workplace environment for public service motivation (e.g., align incentives with employees' PSM morals).

## CSR Perceptions and Employees Work Behaviors

In line with results obtained from studies in developed economies, the studies conducted by (Abdelmotaleb et al. 2018; Abdelmotaleb and Saha 2018) found that employee perceptions of internal CSR were positively related to employee work behaviors. This implies that, if an employee treated well in the workplace (e.g., work-life balance, training opportunities, career development,

and health and safety concerns) then this is likely to increase employee's willingness to display organizational citizenship behaviors and expend discretionary effort to support the organization. Nevertheless, contrary to the findings of Western studies, the results of these studies indicated that external CSR perceptions had no direct relationship with employee work behaviors. This finding indicates that external CSR (especially discretionary and environmental activities) is perceived less important by employees working in the developing economies than those working in developed economies.

One explanation for this contradiction in results between this investigation and previous studies on the subject (i.e., studies which conducted in developed economies) that employees in the developing countries are motivated by provision of the lower order needs and the issue of external corporate social responsibility may not be of much importance to them. The prevailing socioeconomic, political, and cultural environment in the developing countries may not be conducive to the awareness of external corporate social responsibility. It should be noted, however, that no definitive conclusion should be drawn on the relationship between external CSR and employee motivation and work behaviors based upon this one study alone. Further studies should be undertaken in developing countries like Egypt to confirm the relationship between external CSR, employee motivation to serve the public and employee organizational citizenship behaviors.

A question that could be raised concerns the issue of how could an organization increase the awareness of external CSR so that external CSR would have similar impact upon employee positive work behaviors as it does in the developed countries of the world. The author believes that efforts should be exerted by organizations in the developing countries to not only do more for the external stakeholders but also to increase the awareness of external CSR among employees in the developing countries, human resources managers should consider providing employees with regular updates as to the organization's involvement in external CSR initiatives, and clearly communicate to employees the importance of those external aspects of CSR efforts in employee orientation and socialization initiatives. Efforts should be directed to provide adequate CSR training to promote CSR as a core organizational value. Further, HR managers would consider employee social performance in performance appraisal and promotions. The HR departments should also design an employee performance appraisal system that would also recognize and reward employees for their positive social performance. The author also believes that governmental bodies and other public institutions in the developing nations have a vital role to play in enhancing individuals' awareness of the external responsibilities of organizations. Employees should be encouraged to help their communities. Managers of organizations should attempt to build positive attitudes toward the environmental and other external CSR aspects.

## Conclusion

Our current knowledge about the antecedents and outcomes of Corporate Social Responsibility (both internal and external CSR) in the developing countries is severely lacking. The author recommends that a great deal of research should be undertaken in the developing countries including the Middle-Eastern countries. Obviously the social and cultural environments, the type organizational designs and the kind of political environment vastly differ among these countries despite them being called the developing countries. For example, the Middle East is a region with diverse cultures, and some cultural values are common while others are very different. It is very likely that the way organizations in this region are structured and the CSR practices carried out by corporations and public institutions will also be different. Accordingly, additional research is needed on this topic in all geographical locations so that better understanding of the differences and similarities of internal stakeholders' perceptions of CSR prevails in both developed and developing countries of the world. The knowledge gathered in the developed countries concerning the value of

CSR for multiple stakeholders of organizations in those countries should inspire all corporate stakeholders in the developing countries as well to undertake more research on CSR so that all citizens can benefit from corporate initiatives for social responsibility.

Community development; Corporate social responsibility; Corporate strategy; Economic contributions; Sustainable development

## Introduction

Corporate social responsibility (CSR) denotes a company's efforts to enhance the social, environmental, and economic impacts of its operations in ways that positively affect the community (Bredgaard 2004; Porter 2008). Through CSR, companies are able to achieve a balance between economic, environmental, and social imperatives while addressing the expectations of shareholders and stakeholders (Galbreath 2006; Porter 2008). It is therefore a business practice that incorporates sustainable development into a company's business model. A robust CSR program offers an opportunity for companies to demonstrate their corporate citizenship by looking at the entire environmental sphere in which they operate (Moon et al. 2010; Baisakalova and Amagoh 2020).

The impacts of globalization have facilitated the diffusion of CSR practices through the expansion of multinational companies into emerging economies such as Kazakhstan (Hamid et al. 2020; Ali et al. 2017). For its part, Kazakhstan's government has been actively promoting the idea of CSR over the years. After its independence from the Soviet Union independence in 1991, the concept of CSR was relatively new to the country and was first raised by the country's President, Nursultan Nazarbayev, at the II Congress of Entrepreneurs in Astana in 2005 (Smirnova 2012; Mouly et al. 2010). The President argued that the

country needed a model of CSR which focuses on world best practices and takes into account the economic, social, and multicultural context of Kazakhstan. The President envisioned a CSR model that addresses the country's ecological, social, and regional issues, while focusing on activities aimed at the economic well-being of the citizens. In 2009, a CSR contest named "Paryz" was initiated by the President and attended by more than 300 business entities (Novostei 2009).

It is important to stress that the promotion of CSR activities should be such that it does not adversely affect the economic viability of the companies involved. According to Blowfield (2005), Galbreath (2006), and Moon et al. (2010), a well-implemented CSR concept can facilitate a variety of competitive advantages for companies, such as enhanced access to capital and markets, increased sales and profits, operational cost savings, improved productivity, improved brand image, and so on. To facilitate the development of CSR in Kazakhstan, the government has developed strategies that integrate efforts of the state, businesses, and civil society organizations (Mahmood and Humphrey 2013; Baisakalova and Amagoh 2020).

## Theories of CSR

Over the years, various theories of CSR which are essential for sustainable development have been promoted. Three of such theories are *resource dependency theory*; *stakeholder theory*; and *legitimacy theory*. *Resource dependency theory* states that boards of directors have the capability to integrate the economic resources, information, skills, and knowledge for their company's success (Pfeffer and Salancik 2003). Boards of directors serve as a link between a firm and its external resources and thus can help mitigate uncertainties through transparent CSR information (Kiel and Nicholson 2003). Based on *resource dependency theory*, it can be suggested that the constitutive nature of boards of directors of companies in Kazakhstan has implications for CSR development in the country.

According to *stakeholder theory*, the long-term survival and sustainable development of an entity depend on the support of all stakeholders (van der Laan Smith et al. 2005; Orazalin 2019). The theory suggests that a firm's objectives and goals can be realized by balancing the competing interests and demands of various stakeholder groups (such as employees, customers, suppliers, auditors, shareholders, and the general public) (Freeman 1984; Mahmood and Humphrey 2013). Stakeholders of business entities have specific needs and expectations with regard to a firm's CSR activities. These include environmental management, effective and efficient use of natural resources, equity in employment practices, positive impacts on the community, etc. (Chakroun et al. 2017). *Stakeholder theory* is quite relevant to CSR in Kazakhstan because it supports improvements in several CSR issues, such as CSR disclosures; robust implementation of CSR activities; environmental activism; and policies that aim to satisfy the needs and expectations of all stakeholders in a diverse and multicultural society like Kazakhstan (Orazalin 2019).

*Legitimacy theory* states that there is a social contract between business organizations and society (Cormier and Gordon 2001). To satisfy such contractual obligations, businesses legitimize their actions and enhance their legitimacy through the disclosures of their CSR activities (Branco and Rodrigues 2008). Businesses in Kazakhstan may, therefore, legitimize their existence and earn social acceptance by disclosing more information on CSR activities. Such disclosures may include contributing to natural resource conservation, equitable recruitment and treatment of employees, philanthropic activities, etc.

## Models of CSR and Dimensions of Sustainability

A number of CSR models have been stated in literature in recent times. Two of such models are Carroll's CSR Pyramid and Fox et al.'s CSR Policy Framework. Carroll's CSR Pyramid was developed by Archie Carroll in 1991 and states that CSR comprises four basic social

responsibilities: *economic, legal, ethical, and philanthropic*. *Economic responsibilities* include a company's obligations to be profitable and deliver goods and services that meet the needs and expectations of society. *Economic responsibilities* are considered the most important category of CSR because they are the prerequisites for meeting the other responsibilities of CSR. *Legal responsibilities* refer to the ability of companies to operate and make profits in compliance with government laws and regulations. *Ethical responsibilities* refer to the moral and ethical attitudes of companies, such as justice and equity standards in ways of doing business. *Philanthropic responsibilities* are voluntary activities that companies engage in for the welfare of society. These include charitable donations and financial and other contributions that improve the quality of life in the community (Carroll 1991).

Fox et al.'s CSR Policy Framework was proposed by Fox et al. (2002) and consists of four components: *endorsing, partnering, mandating, and facilitating*. *Endorsing* means that governments should provide political support and a conducive environment for the promotion of CSR activities. *Endorsing* affirms and validates business contributions to society. *Partnering* is the ability of governments to partner with business and civil society organizations in order to promote CSR (Fox et al. 2002; Bredgaard 2004). *Mandating* emphasizes the utilization of legal instruments to promote or prohibit CSR programs. Governments can define minimum standards for CSR activities and impose penalties for violators of such standards within the legal framework. *Facilitating* is the ability of governments to play a supporting role for CSR through various schemes, such as tax incentives, subsidies, and other economic motivation programs (Fox et al. 2002).

An important aspect of CSR is the sustainability (social, environmental, and economic) of such policies and programs (Ismail et al. 2018; Branco et al. 2014). Sustainability is the ability to meet the needs of the present without compromising the ability of future generations to meet their own needs (Brundtland 1987; Branco et al. 2014). Social sustainability is the promotion of social justice through equitable resource allocation, poverty alleviation, and adequate access to social services (such as education, nutrition, health, etc.). Environmental sustainability involves the conservation of biodiversity, attaining atmospheric balance, and responsible utilization of natural capital (Brammer and Pavelin 2008; Orazalin and Mahmood 2020). Economic sustainability occurs when social and environmentally sustainable development is financially feasible. Economic sustainability facilitates the provision of economic welfare at present and in the future (Tavanti 2010; Vurro and Perrini 2011). Based on these models and dimensions, a number of studies have been conducted on CSR in Kazakhstan as discussed below.

## Selected Studies of CSR in Kazakhstan

One of the earlier studies on CSR in Kazakhstan was conducted by the country's Ministry of Labor and Social Protection in 2007. The government conducted a survey of 40 companies operating in 5 industries (mining, oil and gas, construction, food, and agriculture) in order to determine their CSR activities. The study found that the CSR activities of the companies focused mostly on internal and external CSR responsibilities (Mouly et al. 2010; Smirnova 2012). Internal social responsibilities refer to the development and training of employees, provision of health care, safe work environment, etc. External social responsibilities consist of corporate philanthropic activities, environmentally friendly operations, and other activities that contributed to the development of the region.

Smirnova (2012) applied Carroll's CSR Pyramid to investigate CSR activities in Kazakhstan. The results of the study showed that legal responsibilities were considered most important by respondents in the survey. According to the results of the study, being socially responsible meant protecting the environment and balancing the interests of stakeholders within the constraints of the law. A reputable public image was also identified as one of the benefits for companies that practice robust CSR activities in Kazakhstan.

A study by Mahmood and Humphrey (2013) also applied Carroll's CSR Pyramid in investigating stakeholders' expectations in Kazakhstan. The

results of the study showed that that the Kazakh government and internal stakeholders expect companies to focus more on the economic and legal dimensions of Carroll's model. However, external stakeholders and non-governmental organizations expect companies to show more emphasis on ethical and discretionary dimensions of Carroll's CSR Pyramid.

Orazalin (2019) examined CSR reporting practices and the effects of board characteristics on CSR disclosures in the banking sector in Kazakhstan. The study found that board gender diversity has a positive impact on CSR disclosures and that banks with foreign ownership were found to be more extensive and transparent in their disclosures of CSR activities than locally owned banks.

Using the standards of the *Global Reporting Initiative (GRI)* framework, Orazalin and Mahmood (2020) investigated the determinants of sustainability performance disclosures of publicly traded firms in Kazakhstan. Data for the study was collected from the Kazakhstan Stock Exchange between 2013 and 2015. The results of the study showed the determinants of sustainability reporting consist of firm profitability, firm size, reporting language, and auditor type.

Finally, Baisakalova and Amagoh (2020) investigated the state of CSR in Kazakhstan using Fox et al.'s Policy Framework and Carroll's CSR Pyramid. The study identified five determinants of CSR policies in Kazakhstan. Four of the determinants were found to be within Fox et al.'s (2002) framework, while one was found to be within Carroll's model. The four determinants in Fax et al.'s Policy Framework consist of the following: legal instrument (a *mandating* activity); economic instrument (a *facilitating* activity); partnership instrument (a *partnering* activity); and public information (an *endorsing* activity). Within Carroll's model, the study found philanthropic activities as some of the methods of CSR used by companies in Kazakhstan.

While the above studies explored various aspects of CSR in Kazakhstan, a relevant question becomes: how do foreign investors view Kazakhstan as a place of doing business in light of the country's corporate code of governance and CSR reporting practices?

## Kazakhstan's Corporate Code of Governance and CSR Reporting Practices

Kazakhstan enacted the *Code on Corporate Governance* in 2005 in accordance with the precepts of the OECD. The main idea was to enhance transparency, accountability, honesty, fairness, responsibility, and professionalism of business practices in the country (Orazalin 2019; Coffie et al. 2018). Over the years, corporate governance practices in Kazakhstan have been influenced by various laws and regulations, such as the *Law on Accounting and Financial Reporting*, the *Law on Joint Stock Companies*, the *Law on Banks and Banking Activities*, and the *Law on Securities Market.* Despite these regulations, Cigna et al. (2017) report that publicly listed companies in Kazakhstan demonstrate relatively weak corporate governance practices. This lack of compliance with corporate governance principles has made Kazakhstan to be considered as a risky business environment by foreign investors (Johannesson et al. 2012; Mahmood and Humphrey 2013). While all financial institutions in Kazakhstan are obliged to prepare financial statements in accordance with the *International Financial Reporting Standards*, there are no mandatory requirements for disclosure of CSR activities by Kazakh-listed companies in their annual financial reports (Orazalin 2019; Cigna et al. 2017). This means that the disclosure of information on CSR activities by Kazakhstani-owned companies only occurs on a voluntary basis. Consequently, with few disclosures of CSR practices by Kazakhstani-listed firms and weak corporate governance practices, foreign investors are likely to view Kazakhstan as a country with a weak business environment (Mahmood and Orazalin 2017; Mouly et al. 2010).

## Conclusion

Kazakhstan has continued to evolve in its CSR practices since it gained its independence in 1991. The influx of multinational companies with western best practices into Kazakhstan has facilitated this evolution. From recent studies, it seems that

components of Carroll's CSR Pyramid and Fox et al.'s CSR Policy Framework encompass several aspects of CSR policies and practices in Kazakhstan. The government and citizens of Kazakhstan support socially responsible firms, and, as such, companies that engage in CSR have a better reputation and brand loyalty in the country. The lack of mandatory disclosure requirements of CSR activities by Kazakhstani-owned firms on Kazakhstan's stock exchange and the country's weak corporate governance practices mean that foreign investors may tend to view Kazakhstan as an environment with a high risk for doing business. Encouraging more robust CSR policies will not only contribute to societal welfare but also facilitate the long-term sustainable development of Kazakhstan.

# Corporate Social Responsibility in Public Services

Francesco Agliata
Department of Economics, University of Campania "Luigi Vanvitelli", Capua (Caserta), Italy

## Synonyms

Cost system in public services; Management accounting in public services; Process accounting

## Definition

The first definition traces how CSR theory is applied in practice: by the social responsibility of a firm, we mean the tendency shown by the firm – and, therefore, by the top management of the same – to satisfy, in an ever-increasing manner and beyond legal obligations, the legitimate social, environmental, and economic expectations of stakeholders through business management (*EU Green Book*: 7).

## Introduction

Among the most important key concepts are the explicit reference to global interests, the stress on company management as promoters of action, the three dimensions of the social message (social, in a strict sense, environmental, and economic), the reference to overcoming strict legal obligations, and, finally, the endnote that contextualizes the entire concept, inserting it in the performance of the company's activity and not viewing it as an external postscript. This approach is known as the triple bottom-line vision, as it suggests to the firm to act constantly on three fronts: economic, social, and environmental. The novelty consists in the consideration of these three aspects jointly as sides of the same figure, which will result in global value only if exploited from a systemic point of view.

The diagram shows the relational connections among economic, social, and environmental concerns (including a link of company solidarity between the economic and the social) – connections that also determine the correctness of the choices that have to be made to maintain (or to achieve) the best possible relations between the company and civil society, as well as between the viability of industrial operations and the feasibility of business plans from both an industrial and an environmental point of view. It is evident that the link among the three aspects permits the sustainability of the entrepreneurial action in all three areas (Elkington 1997).

Although CSR is constantly evolving and gaining increasing acceptance, it does not constitute a firm's final goal; a company must improve its

positions coherently, as it progresses over time. The method of implementation and the expository form of the statement may change, but the firm's final objectives remain the same. In fact, CSR and economic value are two faces of the same coin and should be pursued as a single goal. To respond to the demands of all interest holders with the firm's actual activity is to be truly attentive to global profit value and to maximizing profits (Smith and Taffler 1992).

This sensitivity is witnessed by the increasing number of CSR projects and documents: the ethical code, the values papers, the social report, the environmental report, and the sustainability report. Nonetheless, these documents still principally remain a prerogative of large-sized companies, primarily because they require very expensive management systems that are difficult for small companies to implement.

However, national and international reality is demonstrating a different tendency, which is that there are other relevant elements from which to choose. For example, we can consider the anchorage of many companies to shared values – Catholic, liberal, and socialist – and as promoters of attention toward the expectations of employees and their families; the diffusion of the cooperative movement and, in particular, the social cooperative as an innovative instrument to reach the general interest of the community and the social integration of its citizens; the social value provided by industrial districts that perform the fundamental function of developing technical and commercial knowledge, entrepreneurial culture, and services to employees and their families; the deep-rooting of the firms within their territory; and the prevalence of family firms, often characterized by a positive management of the relationships with collaborators, in addition to the dimensional element, which represents our reference variable (Porter and Kramer 2006).

However, the barriers are varied; they can hinder the development of sociality in the company and can be summarized in the following points:

- The cost of implementing CSR activities when survival is often the greatest economic imperative
- Time and resource constraints which may mean a lack of affordable external support and resources
- A lack of awareness of the business benefits

- The fact that existing CSR tools and guidelines are mainly geared toward large business
- No systematic incentives
- Fear of additional regulatory and bureaucratic burdens (Armstrong and Green 2013)

## CSR in Public Utilities Companies

The public utilities companies must implement a production process to obtain the services that are transferred to their customers and to the community of reference; however, the activity of these companies, by virtue of the role of public utility entrusted, is characterized by a broad social component.

This social character is recognized in the fact that the service must:

- Be equally available to all members of the community at a fair price
- Be set up with homogeneous characters for the entire community
- Ensure a performance of adequate quality level to all applicants

True social integration is not only implemented through strategies that simultaneously pursue the goal of providing a service to civil society and the benefits for the company. Indeed, the implementation of these specific strategic choices, which seem to be of a competitive nature, could even coexist with behaviors of absolute irresponsibility toward employees, minority shareholders, lenders, suppliers, and customers, in various ways marginalized from the goals of the organization (Fox et al. 2002).

Consequently, in order to maximize the socio-economic value, the objective of value creation can be pursued by reconciling the need to optimize the use of available resources (mainly public) with the safeguard of a broad and generalized access to the services provided.

Therefore, in the sector of public services companies, there are strong constraints deriving from the connotation of public utility that characterizes them, which heavily influence the design and management of the production structure. The task of ensuring an adequate quality level of service to all applicants is assigned to these companies. This task is a constraint that has direct and immediate consequences on the size of the company's production capacity and on the production methods adopted; these elements introduce a high degree of uncertainty on the development of the production process.

A sui generis obliged sociality exists in this context; this sociality would seem to be added to that of a traditional voluntary type. The latter, based on recent developments in the doctrinal studies on the subject, can be interpreted as an entrepreneurial attitude – in harmony with the dynamics of the environmental and relational system of belonging – aware that the growing attention to ethical and moral values, the improvement of quality of life, the recognition of workers' rights, and the development of human capital favor the development of long-term value strategies; in this way the achievement of a sustainable competitive advantage is allowed.

In particular, the presence of external constraints, connected with the social activity, clashes with the strategic repositioning of public utilities; alongside an institutional objective, one of an economic nature is presented, expressed not in terms of income but of "sufficient coverage of costs" through operating revenues (Ball and Grubnic 2007).

## The Social Information

A typical perplexity in the accounting survey, connected to the provision of essential information to carry out a correct monitoring activity, consists in not neglecting a documentary attestation of the sociality, inherent in the specialty activity of the public profit company. To this occurrence, at present, no obligation is ascribable to the top management. The typical nature of socially responsible behavior, in this specific case, is to respect the whole series of contractual provisions preordained to satisfy a general interest; thus the classical approach is overcome; it provided for informing and starting a dialogue with its interlocutors on the added value created

for the environment/community following the freely assumed strategic decisions (Preston 1981).

However, the singular condition of sociality found in public utilities would seem not to distort the structure of general accounting. The models for socio-ambiental information will continue to be linked to voluntary disclosure, where attention to socio-environmental variables is becoming more and more relevant (Baginski et al. 2000).

The discussion is based on the opportunity to create new and appropriate accounting documents, which provide information to the outside world. The starting hypothesis is that the activity of each company performs a social function and the effectiveness, achieved in the performance of the latter, must be communicated to the outside, in order to consolidate the consent of the community and stakeholders in their complex.

Some scholars believe that the financial statements should be socialized, that is, having to expand the information currently contained in the financial statements including new parameters, quantitative and qualitative, also concerning the social, ethical, and environmental aspects and aimed at increasing the number of stakeholder business recipients. According to the classical theory, conversely, the statutory financial statements are an accounting document aimed at providing the periodic, complex picture of the balance sheet, financial and economic equilibrium of the year and in which other information should not be placed.

On the contrary, a second line of study is oriented toward the so-called integrated reporting, considering that the complex evolution of the economic scenario deserves an integrated document that, alongside the traditional information, will complement other indications drawn up in appropriate formal documents, as distinct but connected to the financial statements and subordinated to it.

A further doctrinal address, moreover, referring to the theory of systems, inserts the financial statements in the broader information system of the firm, classifying it as its subsystem; the complex of all the documents of various extractions, deputed to the reporting of the complex business reality, would provide the global reporting (An et al. 2011).

However, some scholars recognize this expansion of information as the danger of opportunistic strategic use by management in order to manipulate information and control investor behavior. More precisely, managers, reporting information with an intentionally optimistic emphasis, could increase the quotation of the managed company in the short term and, consequently, improve its remuneration (impression management theory). In this regard, Smith and Taffler observe: "We would expect (. . .) that good financial performance will be associated with a clear and readable (. . .) narrative, and an obscure narrative with bad financial performance."

However, this theory is counterbalanced by the thought of other scholars who recognize the usefulness of an additional contribution, so that the information asymmetries existing between managers and recipients of information are overcome (incremental information theory), thus reducing the risk perceived by market operators. In this case, managers, reporting information objectively, could increase their reputation, decrease the cost of capital over time, and in the long run improve the company's price and its remuneration (Baginski et al. 2004).

In some European contexts, the inclusion of final and prospective items of a social and non-financial nature in the annual management report is envisaged. This inclination was legitimized through the implementation of the EU Directive No. 51 of 2003, which recognized the usefulness of information concerning the environment and personnel, considering them among the essential elements to be included in the management report.

In contrast, at international level, the IASB issued an ad hoc standard – IFRS – Management Commentary, a framework for presentation (2010). The question concerns the framing of the new report and the possibility of modifying IAS 1 "Presentation of Financial Statements" in such a way as to include within its essential requirements as well as the correlations with the other existing economic-financial statements (Fig. 1).

**Corporate Social Responsibility in Public Services, Fig. 1** Management commentary

**Corporate Social Responsibility in Public Services, Fig. 2** A synthesis of two trending reporting forms (Cohen and Karatzimas 2015, p. 456)

In other words, in the intentions of the IASB Board, an autonomous and specific space for socio-environmental information would seem not to have been assigned yet. Little relevance attributed to this theme by international accounting standards, with direct effects also for public utilities companies, is perceptible.

Finally, in the public sector, the response to the new information needs could be found in the middle through the development of the "Integrated popular reporting". This new report, mixing the main characteristics of the integrated reporting and popular reporting, should have the features evidenced in Fig. 2.

## Conclusion

In the context of public utilities companies, a connotation of social responsibility with an external value of nonvoluntary matrix is ascertainable; atypicality is certified not so much by the characteristics of socially responsible behavior to be assumed as by the driving impulse of the conduct to be pursued. With reference to these companies, sociality is understood as a nascent corporate bond with the publicistic connotation of the service and not so much as an instrumental choice for the attainment of a competitive advantage.

The fundamental role of social vision in the observed company, conceived as an economic and social system, is intuitive; this vision involves the need to pilot a plurality of subjects in the direction of an appropriate balance between economic objectives and social responsibilities. It extends the scope of the economic entity, in relation both to the functions to be fulfilled and to the interlocutors to be satisfied. Although an expansion of the interested stakeholders is contemplated, the primary position assumed by the entrepreneur is never questioned; he will now be invested with

the task of coordination and conciliation of the different instances, as well as the exercise of command and guidance.

The widespread opinion is that the social commitment of the company combined with behaviors with lucrative purposes has the propensity to create added value for the company. The pressure exerted by the various interlocutors makes it possible to highlight the importance of social responsibility within the process of formulating economic-rational choices; in fact, even in the absence of an adequate system of incentives and sanctions, the economic results could vary considerably as a result of a loss of corporate image and prestige (Agliata et al. 2017; Walker and Brammer 2009).

# Corporative Social Responsibility Vs. Public Administration

Pedro Antonio Martín Cervantes and María del Carmen Valls Martínez
Economics and Business Department Ethics, Gender and Sustainability Research Group, University of Almería, Almería, Spain

## Synonyms

Contextualization; Corporate social responsibility; Globalization; Governance; Moral relativism; Public Administration

## Definition

A reduced review of the relationship between Corporate Social Responsibility and Public Administrations, based on the contextualization and determination of the historical roots of the term. It is included a summary of the most recent lines of research that have examined the binomial CSR-Public Administrations.

## Introduction

There seems to be a widespread misconception that Corporate Social Responsibility (hereinafter, CSR) is a relatively modern concept that emerged in the 1950s from the seminal contribution "Social Responsibilities of the Businessman" (Bowen

1953). In the same way, a false construct seems to have become generalized in order to locate Western European nations during the modern age as the precursors of both Public Administration and public and private governance. On the contrary, all these terms have their origin in the so-called fertile crescent of the Middle East, and they are as antique as the first human civilizations that emerged in those areas after the Neolithic era. The plausible existence among academia of a certain "Moral Relativism" makes it difficult to analyze the authentic historical roots of the CSR and its multiple links with the Public Administration, both insofar as they offer a biased, diffuse, and simplistic perspective of this phenomenon.

Besides following a staggering historical evolution entirely dependent on the sociopolitical context in which the CSR has been inserted (Mathis 2008), many other factors must be taken into account, such as the religious and the cultural ones, the degree of efficiency reached by the Public Administrations in the allocation of resources or the mere adherence of the citizen to its most elementary precepts. In the same way, two relatively recent phenomena, globalization, and multilateralism have led to an "international homogenization" of the CSR, in the sense that most nations have been required to adopt the directive of a series of consensual patterns when carrying out their social responsibility programs. This Encyclopedia entry briefly contextualizes the historical evolution of the CSR in the field of Public Administration, determining the main elements that have served to characterize and analyze it, making explicit reference to several elements in which the literature does not usually focus its attention as the religious roots of societies or the autonomous reorganization of citizens by providing their counterparts with alternatives to the CSR, when public and private administrations were not able to do so.

## Contextualization

Effectively, the religious phenomenon is historically related to the genesis of the CSR, and it can already be perceived in the Sumerian, Egyptian, and Chinese civilizations (Laha 2016) which developed highly bureaucratized Public Administrations in relation to those periods. More specifically, the precursors of bureaucratization were two civilizations, the Elamite and the Sumerians (see Farazmand 1999). Several millennia later, on these same territories (present-day Iran and Iraq), the Islamic civilization established a genuine network of Public Administrations that would extend westward in *Al-Andalus* (present-day Spain) and eastward in Indonesia. In these countries, a series of charitable institutions were developed that were exclusive to Islam (e.g., the *Awqaf*) because "piety" is one of the five pillars on which Islamic law is based, characterized by serving in a dual form, as a guide and as governance for its believers (Sachedina 2006). Consequently, the philanthropic institutions born by this path sheltered (and continue to shelter) the achievement of a series of plans of marked social character not very different from the current CSR, for instance, funding schools and hospitals. It should be noted that these institutions were able to carry out their objectives uninterruptedly throughout the centuries, despite the pernicious effects that the processes of colonization-decolonization had on Islamic countries (Bader and Maussen 2011).

Concerning the Christian faith, without the need of carrying out an exhaustive description of the principles of the common welfare that guide this faith, as the explicit condemnation of usury, the Catholic Church took quite a while to take action in the matter and it would not be until the papacy of Leo XXIII, already in the Second Industrial Revolution, that the Encyclica *Rerum novarum*, defends the right of workers to obtain a fair salary, to create unions to assist them in their labor rights or in providing their services in clean and safe working environments. In a certain sense, through this Encyclica the Roman Church was trying to position itself as a third way between Marxism and Capitalism, regardless of whether it recognized private property rights and freedom of enterprise. Almost at the same time, the Protestant ethic makes its appearance in "The Gospel of Wealth," work of the steel-industry magnate A. Carnegie (Carnegie 1889). This manuscript of barely 12 pages, considered by most of the

literature as the "founding act" of the modern CSR, constitutes a program of intentions for the future of American society, in which it made an express appeal to the wealthiest social strata to devote their wealth to the realization of philanthropic works to foster socioeconomic growth and promote the integration of those social strata living in conditions of poverty.

However, Carnegie's purpose was one thing, and the dictates of the harsh reality of those times quite something different: The Sherman Antitrust Act of 1890 (signed on July 2 during the presidency of B. Harrison) strictly prohibited the monopolistic practices on which Carnegie erected his fortune, inasmuch as public opinion commented on whether this initiative was in itself a matter of philanthropy or a double standards of morality game with the most disadvantaged. Even more representative was that of another "angel benefactor" of the society, the oil-mogul J.-D. Rockefeller, who avoided this law in 1911 by subdividing the mythical Standard Oil company into 34 subsidiary companies. Despite the philanthropic stigma of Rockefeller, many of these companies were directly involved in several war conflicts in Latin America (e.g., Chaco War) and the Middle East, contributing to the destabilization of this world area for the benefit of the particular interests of this business conglomerate. A similar scheme was followed by another renowned oil company, the Anglo-Persian Oil Company founded by W. Knox D'Arcy, which monopolized the extraction of crude oil and other mineral resources from Iran to the clear detriment of the native population of this country. It is in this extreme that a new side of the Moral relativism of CSR is evident, both in terms of the economic benefits obtained through the exploitation of foreign populations that were socially blessed.

In addition, a cruel paradox occurred: those millennial nations in which the first glimpses of Public Administration and CSR were born (e.g., Iraq, Iran, Egypt, or Transjordan) were vilified by newly created countries promoted by a strong philanthropic character that at most and, if produced, would only benefit their own nationals, not at all, those areas that suffered from such a degree of exploitation. In the face of the historical figures of the CSR, socially recognized and accepted, during the era of alcohol prohibition, various individuals belonging to organized crime began to emerge whose business organizations represented fierce competition to the interests created by government policies. Shaw and Shaw (2019) use the following proverb by the thirteenth-century Persian poet Y. M. Rumi to describe certain parallelisms with the famine of that time: "The satiated man and the hungry man do not see the same thing when they look upon a loaf of bread." Indeed, a quote normally attributed to A. Capone in the 1920s revived this reflection centuries later: "When I sell liquor, it's called bootlegging; when my patrons serve it on silver trays on Lake Shore Drive, it's called hospitality." Circumstantially, many of these underworld members became quite popular when they exercised a proactive community service during the period of the Great Recession, providing food for large masses of unemployed while the sadly famous "Hoovervilles" were gathering in the main US cities.

Especially notorious was the case of A. Capone (see The New York Times 1930), whose charitable campaign was materialized in the "Capone's Free Soup Kitchen" aimed at satisfying the basic needs of thousands of abandoned people in the face of the inane attitude of the Public Administrations that were unable to take charge of the situation or the inefficiency of the CSR programs that could be considered legal or "official." Late in the twentieth century, several dogmas of faith inherited from the industrialization of contemporary Western societies began to fade away. On the one hand, the works of G. Akerlof, M. Spence, and J.E. Stiglitz refuted the capacity of markets, which had been preconceived in the past as mechanisms that, systematically and in all conditions and contexts, were capable to efficiently allocate the productive resources generated by the economies, since the empirical evidence pointed out continuous informational asymmetries in the economies (see Lofgren et al. 2002). On the other hand, Stiglitz and Rosengard (2015) emphasize that the governance of Public Administrations constitutes in

**Corporative Social Responsibility Vs. Public Administration, Fig. 1** Summarized time line of the evolution of the contemporary Corporate Social Responsibility. (Source: Own elaboration from Mathis 2008)

itself a "public good" that must be safeguarded since the correction of market imperfections largely depends on its adequate implementation, a fact that also depends on the deployment of more effective and efficient CSR policies (Clements and Bowrey 2010).

Fig. 1 represents a summarized timeline outlining the constant evolution of the CSR over the past decades. Among all these periods, it is important to highlight the first and the last one, as they have meant for the current conceptualization of CSR. In this sense, the decades of 1940–1950 were singularly decisive for two factors: the disruption of the Great Depression that has already been mentioned and the devastation caused by the Second World War, whose effects prompted the Public Administrations to restructure and enact new measures aimed at social protection such as the emergence of modern welfare states. The last period (2000–present) marks the triumph of the globalized world from the perspective of the CSR, including prospects for its implementation that are increasingly diversified and congruent with the problems confronting by today's society, such as the awareness of the environmental issues, the achievement of a real "green economy," the racism or the still perceptible gender differences in the labor sphere (see, e.g., Valls Martínez et al. 2020).

## Current Trends of the Relationship Corporative Social Responsibility Vs. Public Administration

Nowadays, the "Old CSR" has been readapted to the resolution of the new problems facing the citizens. In short, supranational organizations

**Corporative Social Responsibility Vs. Public Administration, Fig. 2** Actors to whom government policies are addressed. (Source: Own elaboration from Albareda et al. 2007)

have been developing ambitious joint plans that insist on the democratic participation of society as a whole. One of these examples is the Rio-1992 Agenda (Agenda 21), in which the social interlocutors were called upon to implement programs of mutual economic dependence between Public Administrations and individuals that would open up new perspectives in Social Responsibility (Theuer 2013). According to Albareda et al. (2007), these new perspectives configure four basic types of relations between the actors that define the binomial CSR-Public Administrations, as detailed in Fig. 2.

In the perspective of Steurer (2010), the government authorities are interested in these new types of CSR because they facilitate on a completely voluntary basis the achievement of the political objectives set while transcending the classical measures related to sustainable development and environmental protection to the realization of international projects such as humanitarian assistance, usually defined from periodic programs or "agendas" (see, e.g., EC 2011; MESS 2015). In short, this is how Nelson (2008) summarizes the new commitment between Business and Public Administration:

> [. . .] exploring the relationship between corporate responsibility and traditional business lobbying, political campaign finance, payment of taxes and government relations, let alone new approaches to influencing or addressing public issues such as public-private Corporative Social Responsibility vs. Public Administration partnerships, charters and covenants between governments and business groups, multi-stakeholder policy consultation structures, and new governance and accountability mechanisms.

## Conclusions

Certainly, post-Second World War represented the emergence of the modern concept of CSR (Mathis 2008), but it did not mean the coinage of a univocal and closed concept, immune to the passage of time or lacking a series of ancestral historical roots that can be traced in the first human civilizations of the Middle East. Bowen (1953) is mistakenly pointed out as the first manuscript to reflect on CSR, emphasizing those ideological perspectives that reject the CSR by default (Friedman 1970) as if it were a *Scylla and Charybdis* dilemma. In reality, CSR is something much simpler, what is increasingly complex to analyze are the different organizations that human beings have created in

order to manage themselves in the context of highly changing environments. Globalization and supranationalization are the latest reefs that CSR must overcome. With respect to the new types and forms of CSR that will emerge in the immediate future, only time will tell.

# Corrupt Networks and the Land Grabbing Crisis in Uganda

Pius Gumisiriza
School of Public Policy and Governance, Uganda Management Institute, Kampala, Uganda

## Synonyms

Corruption; Corrupts networks; Land crisis; Uganda

## Introduction

Corrupt networks are defined in this entry as groups of corrupt people that collude to abuse entrusted authority for self or corrupt network interests at public expense (see Gong 2002). The term land grabbing is used in this entry to describe circumstances where people whether local or foreign use illegal means to deprive others of their land especially large tracts of land occupied by many people. Land is the most important livelihood asset for the majority of the Ugandan people and an important factor of production for Uganda's agricultural-based economy. In recent years, land grabbing disputes manifesting in mass and violent evictions, incessant and long court cases, and land conflict-related murders have reached epidemic proportions throughout the country with devastating consequences (see Deininger and Castagnini 2004; Oloka-Onyango 2017). President Museveni revealed to the country in May 2017 that corruption is the leading cause of land disputes. However, corruption in Uganda is a collective problem, addressing it and protecting people from land grabbers not only requires punishing people who are easily identified or fronted as corruption perpetuators such as corrupt land officials but anti-corruption measures must be wide enough to capture and also punish wider corrupt-network members that also fuel land disputes. This entry discusses Uganda's precolonial and colonial land ownership and distribution practices, postindependence land ownership reforms, corruption and land disputes, and how corrupt networks influence or fuels land disputes.

## Precolonial Land Ownership and Distribution

Uganda has had a long history of difficult and discriminatory land ownership, access, and distribution practices that lay cumulative negative foundation upon which many conflicts emanate and effect women adversely. Cultural norms and practices in all the precolonial societies that now constitute Uganda looked down upon women and positioned them in inferior roles not only in the institution of marriage, day-to-day functioning of family life but also in the ownership, access, and inheritance of land. Land was always the property of men and women could only access land through their husbands, brothers, and sons. In case the husband died, it would be the sons or husbands clan members to decide who takes what and who does not. Sons were favored over daughters and the choice of a daughter as heir was thus a deviation from the norm. In circumstances where a woman produced only girls, this always caused rebuke, family quarrel, infidelity, polygamy, and even family breakups (see Nakanyike 1991).

## Colonial Land Ownership and Distribution

When the British declared Uganda a Protectorate in 1897, their first major act was the conversion of customary land rights to individualized statutory land rights within Buganda in 1900 and later to other areas like Tooro, Ankole, and Bunyoro kingdom and the main beneficiaries of these individualized land rights were men especially chiefs. In other parts of the country where customary forms of land ownership were not changed, the colonial state worked with senior African patriarchs to foment or develop inflexible land distribution practices and laws that evolved into new structures and forms of discriminatory domination. For instance under the Succession Act 1904 and Succession Ordinance of 1906, which were based on English common law, in case a woman lost her husband, the clan would appoint an heir usually the first son in the family who would inherit the deceased fathers property and take care of the family leaving the widow at the mercy of the heir and her husband's clan (see Nakanyike 1991). Because of such discriminatory land inheritance practices only 7% of women cultivated their own land and only 16.3% of women controlled farm land/holdings in 1995 when a new constitution was promulgated in Uganda (Okumu-Wengi 1996).

## Postindependence Land Ownership and Distribution

President Idi Amin carried the first land reforms in postindependence Uganda when he enacted the Land Reform Decree 1975 that essentially overhauled the previous land tenure system. Under the new arrangement, all land in Uganda was declared public land. Freehold land ownership was converted to leases held from the government on conditions that one would develop that land. The Decree disempowered customary landowners and empowered the government to lease any land occupied by customary tenants to any person (including the occupants) without the consent of the occupants as long as the government compensated them for the improvements. The Decree made occupation of any public land without the governments consent a criminal offence which took away the right hitherto enjoyed by indigenous Ugandans to occupy any unalienated public land (outside urban areas) without prior permission. Customary landowners retained a right to sell or donate their land on condition that the transfer did not vest title in the transferee except over improvements over the land (Mugambwa 2007).

## Constitutional Land Reforms Under the NRM Government

Even before coming to power, President Museveni and his NRA rebels were vehemently opposed to land grabbing and eviction of people from land in the name of development projects or investors. After capturing power, Amin's land decrees were repealed and land ownership powers reverted to the people of Uganda. Article 26 of the Uganda Constitution 1995 affirms peoples' right to property, and Chapter 15 of the constitution explains the institutional framework governing land (The Constitution of the Republic of Uganda 1995). The Land Act 1998 sets the laws on how land matters raised in the constitution can be implemented; the Land (Amendment) Act 2004 affirms women and family rights to land; the Land (Amendment) Act 2010 harmonizes the interest of "bona fide" and Customary/bibanja tenants and national land policy was put in place in 2013 (Oloka-Onyango 2017). The Land Act clearly and extensively explains the roles and functions of different local and central government land structures such as Courts of Law, Land Tribunals, District Land Boards, District Land Offices, Area Land Committees and Recorders at the subcounty levels and local councils in protecting peoples' land rights and mediating land disputes in accordance with the constitution of Uganda, the norms and practices of a community. The NRM government with support from development partners has also reinvigorated land titling basing on scholarly and development partners arguments that if well-implemented land titling on large scale can help pull people out of poverty, increase incentives for productive investments in land, give landholders a more secure tenure, make it easier for them to sell their land or use it as collateral for loans, reduce conflicts and expand state revenues through land taxation (see De Soto 2000). Despite of these policy reforms, constitutional and legal safeguards, land conflicts manifesting in mass and violent evictions, incessant and long court cases and land conflict related murders in Uganda have reached epidemic levels (Oloka-Onyango 2017).

## Corruption and Land Disputes

In May 2017, President Museveni revealed to the country that corruption is the biggest cause of land disputes in Uganda. He specifically pointed his fingers on corrupt land registry officials whom he accused of conniving with land grabbers to deprive people of their land and instructed Lands minister Hon. Betty Amongi to work with the Inspector of Government Ms. Irene Mulyagonja to weed out corrupt officials from the Land registry department (Nakirigya 2017). His assertion that corruption is a huge contributor to land disputes has been reiterated by many other influential commentators in the Ugandan society including Lands Minister Hon. Betty Amongi, the *Katiikiro* (Prime Minister) of Buganda kingdom Charles Peter Mayiga, Acting Principal Judge Hon. Justice Wilson Kwesiga, the Head of the High Court

Land Division Hon. Justice Dr. Andrew Bashaija, the President of the Institute of Uganda Surveyors Mr. Richard Masereje, an executive member of the Institute of Uganda Surveyors Dr. Ronald Sengendo, and senior Registrar of titles at the ministry of Lands Ms. Louella Ataro (see Mayiga 2017; Wambi 2017). For commentators that have been following corruption trends in Uganda from the early 2000s, the assertion that corruption is the biggest factor fueling land grabbing and disputes in the country is not surprising. President Museveni was seriously committed to fighting corruption in his first 10 years in power (1986–1995) as evidenced in the prosecution and sacking of key government leaders including his brother General Salim Saleh who was sacked from the position of army commander. However starting with the 2001 presidential elections when real political threat to his position as president appeared, Museveni retrogressed on his anti-corruption efforts and corruption did not only become a tool for personal wealth accumulation but also a method of power reproduction and consolidation. Thus since the early 2000s, corruption in Uganda has been on the increase year after year, and the country is now ranked among the most corrupt countries in the whole world. Corruption in several manifestations whether petty or grand, individual or collective, bureaucratic or political, state or regulatory capture is all rampant in most institutions of the Ugandan state (see Badru and Muhumuza 2017). However, most of the research, debates, and remedies on corruption in Uganda are built on the implicit assumption that individuals carry out corruption alone and also focus on corrupt activities in relation to public office and resources rather than the relationships among different actors. In addition, corruption findings by the government or rankings by organizations such as Transparency International rely on Corruption Perception Index, National Integrity Survey, National Service Delivery Survey, and Procurement Integrity Survey that mainly aim to capture the perception of the population about corruption prevalence. Whereas these can provide us with a picture of what the citizens think about corruption, such perception studies cannot tell us how corruption works within organizations, the different players, their roles in corrupt transaction, and what sustains the actions of actors in a corrupt network. Yet in recent years, it has become evidently clear that most corruption in Uganda is happening in a syndicated manner.

## Corrupt Networks and Land Disputes in Uganda

Corrupt networks fall in the syndicated or collective category of corruption that occurs when a group of corrupt people conspire and collude to abuse entrusted authority for self or corrupt network interests at public expense (Gong 2002). In the case of Uganda, corrupt-networks actors fueling land disputes mainly include people at the very top in government, investors, business people, brokers, and security officers collude to grab others land. However, corrupt networks are very elusive, hard to penetrate, and very difficult to research because in many cases, they prohibit members from revealing information to outsiders, any leakage is easily detectable and immediate action is taken. They create their own internal codes of social ethics, communications, and survival dynamics based on strong network of trust, loyalty, mutuality, reciprocity, repression, kinship, politics, and economic interests to protect those involved in corrupt practices and efficiently subvert the prevention of corruption. Members informally know each other thus they are able to keep their activities covert from any suspicious person or anybody outside their arrangement. Actors in corrupt networks also protect themselves by using their expertise knowledge on anti-corruption institutional frameworks and forming pervasive structures among actors who once recruited into corrupt networks may find out later that it is difficult or even prohibited to move out due (Jancsics and Jávor 2012). Investigating corrupt networks in Uganda that involve high-profile people is also very difficult and may not yield accurate information as informants may not want to be quoted or take responsibility for giving out such information in fear of risking their lives or jobs. The only way around that is for the very powerful people with authority to sanction such investigations. Indeed

in February 2017, President Museveni established Land Inquiry Commission led by Justice Catherine Bamugemereire to carry out a nationwide investigation on land-related conflicts in the country. This commission has the full backing of the President, has powers to interview or investigate anybody in the country without exception and can interdict or arrest anyone who does not observe its orders (see Nakirigya 2017). Thus to thread the nature of corrupt networks and how they influence land grabbing and conflicts in Uganda, this paper uses content analysis of sampled land conflict cases investigated by the Catherine Bamugemereire Land Inquiry Commission and reports for well-established research organization. However, they do not act alone but are part of complex corrupt networks. Very powerful people including President Museveni, members of his inner circle, his family members, close associate, and other influencial people in government including ministers, land registry officials, senior members of the army, police, judiciary, district land board officials, resident district commissioners, prosecutors, brokers, and investors are directly or indirectly part of corrupt networks or in one way or another aid and protect perpetuators of corruption that is fueling mass land evictions and conflicts.

## How Investors, Politicians, Bureaucrats, and Security Officials Collude in Land Grabbing

In January 2018, it was reported by WitnessRadio.org a civil society and research organization in Uganda that members of the army, police, judiciary, district land board officials, the resident district commissioner, prosecutors, courts of law, and investors ganged up together and grabbed over 1,975,834 hectares of land and forcefully evict people from their land in the subcounties of Kitumbi, Bukuyu, Madadu, and Nalutuntu in Mubende district leaving over 265,502 households homeless and in untold suffering. In this paper, the specific case involving 2000 people evicted from land by Mr. Abid Alam in Mubende districts is sampled for analysis. Mr. Abid is a very wealthy businessman of Indian origin and a well-known associate of President Museveni. He is involved in large-scale maize and tea farming among other businesses. The particular land considered in this research is 12 square miles in Nalutuntu Subcounty in Mubende District, where Mr. Abid owns a sugarcane plantation. The residents occupying this land claim that they are the rightful owners having purchased it from Mubende land office. Some claim to have inherited their plots from their former World War II ex-servicemen grandparents and have lived on the same land for over 50 years. On the other hand, Mr. Abid claims to have paid each of the 700 families between Shs 500,000–1.5 million (equivalent to US$ 138–416 in current exchange rates) to vacate the land. In 2010, President Museveni appointed a committee led by Public Service Minister Hon. Muruli Mukasa to investigate the violations, evictions, and suffering claims of these people and resolve the dispute peacefully. According to Mr. Ernest Byenkya, the Lands Inquiry Commission Lead Counsel, all the decisions from government authorities on this land conflict that has been ongoing since 2006 until 2017 when the commission intervened were in Abid's favor. Mr. Charles Bukenya a witness in this conflict told the commission that Minister Muruli Mukasa and his committee never verified people's claims but simply announced a decision to compensate everybody and ordered them not to go back to Alam's land. Bukenya testified that Minister Muruli Mukasa's team decided to pay Shs 280,000 (US$ 78) for an acre of land, Shs 200,000 (US$ 56) for an iron sheet roofed house, Shs 100,000 (US$ 28) grass thatched house, Shs 150,000 (US$ 42) for an acre of plantation, and Shs 150,000 (US$ 56) as disturbance allowance. When the minister's committee discovered that residents had petitioned President Museveni over the matter, their leaders were hunted, arrested, and imprisoned in Kaweri government prison (Kasozi 2017). After discovering that the land inquiry commission was armed with this information, Minister Muruli Mukasa admitted that his committee never had professionals to value people's property, never followed legal or proper procedures for compensation and illiterate people

were made to sign documents that they did not properly understand. He also admitted that the ground was not leveled during the purported negotiations, and many people left the place because most of their crops had been destroyed, and that he was aware of the brutal killing of one of the local council chairman David Senyama who was attacked and killed by workers of Mr. Abid in the presence of the police. The commission of inquiry visited the land in September 2017 and ordered that Mr. Abid should stop evicting people until investigations into the matter are completed. However, Mr. Abid visited the disputed land in October and November 2017 without informing the local leaders and together with around 50 clubs and machetes-wielding men continued with his forceful evictions and the ensuing fight between his men and the locals left many injured. This left the commission stunned at the manner in which Mr. Abid disregarded its directive (Kazibwe 2017). On March 16, 2018, it was reported that Mr. Abid Alam is embroiled in new forceful eviction of more than 700 families from 7 square miles of land in Nalutuntu Subcounty in Mubende district. On Thursday March 15, 2018, hundreds of people traveled from Mubende district and stormed the offices of the land commission inquiry in Wandegeya Kampala seeking the help of the commission and displaying injuries and wounds they sustained as a resulting of shootings and beating from goons hired by Mr. Abid Alam with the support of senior district officials, the acting Resident Commissioner of Mubende, the district police commander, and the district internal security officer. All these are said to be aiding the fresh evictions (Kasozi and Namyalo 2018b). The case of evicting, beating, and shooting of people in Mubende by people working on behalf of Mr. Abid Alam is a classic example of regulatory and state capture where institutions and officials that are supposed to be telling people involved in a conflict what to do, are actually being told what to do and in this case Abid is the one calling the shots. It should be remembered that Abid Alam is connected to President Museveni and one cannot rule out the fact that his sense of being untouchable is linked to those connections.

It was revealed by Catherine Bamugemereire Land Inquiry Commission that on July 9, 2010 and August 4, 2010, Ms. Sarah Kulata Basangwa, a commissioner for land registration and head of department of land management and administration in the ministry of lands, unlawfully registered land belonging to M/s Lakeside City Ltd. in the names of M/s Kikonyogo Investments Ltd. On the basis of this scandal, the Inspector General Government (IGG) charged and interdicted her with a criminal offence in 2011 that she successfully challenged in court on technicalities. Because of the overwhelming credible evidence relating to her fraudulent transfer of land titles in the possession of the inspectorate, the IGG appealed the case. The then minister for Lands Mr. Daudi Migereko lifted her interdiction on condition that she does not repeat the same mistakes and she returned to office. However, her misdemeanors did not end there because investigations into the stealing of Uganda Broadcasting Corporation land by Hon. Abdul Katuntu the former leader of the Parliament's Commission on Statutory Authorities and State Enterprises Committee also revealed that Kulata issued multiple land titles on land plots numbered vol 2699 Folio 13 Plot 27, Princess Anne Drive; Vol-Folio 2762-13 Plot 1, Luthuli Rise; and Freehold Register vol 66, Folio 12, Mbuya. In another case, Ms. Persis Namuganza, the State Minister for Lands queried a land dispute arising from unexplained titling of a land and its cadastral map belonging to Ngambwa Ruta, from the original 23.31 hectares to 95.466 hectares, an increase of 72.156 hectares. Kulata accepted fault in titling the land in question and issued a notice to cancel the portion of the land that had been tilted wrongly in a letter dated July 3, 2017 (Mugerwa 2016). In January 2018, the Senior Assistant Secretary of Bulambuli district local government told the land inquiry commission that she was pressured by Ms. Kulata to allocate 1,500 acres of land to Oscar Twanga and four others contrary to the 400 acres which the area land committee had agreed (Anyoli 2018). On February 8, 2018, while appearing before the Lands Inquiry Commission, Ms. Sarah Kulata also revealed that she fraudulently allocated the playgrounds land of

Nakasero primary and Kololo secondary schools located in Uganda's most prime neighborhoods to private developers (Kasozi and Namyalo 2018a). The example of Ms. Sarah Kulata a senior government lands official working with or for other people to defraud people or government of its land is not a one off or isolated case but rather has been the norm in other land registry offices. For instance, in 2011 Bukalasa land board office in Luweero district was under serious fire after being accused by residents for conspiring with land dealers and processing land titles for fake landlords purposely to grab their lands. One specific example involved Mr. Ibrahim Lutalo, a resident of Kamira Subcounty who accused Ms. Madina Nabukeera the District land board registrar and Mr. Hood Luyima the chairman for issuing a landlord title to a fake landlord on 320 acres of his late father's land. Lutalo explained that his father Athanas Kigumba died in the 2000's before completing the titling process of his land. The family tried to complete the process but it was slow. However, Lutalo argued that the Luweero land board officials connived with land dealers and gave them a land title on the same land that they speedily sold off to another person who transferred it to his names within a period of 1 month. In this case, both the land board registrar Madina Nabukeera and the chairman Hood Luyima dismissed these claims as hearsay (Luwaga 2011). However, other similar cases, of government land registry officials issuing land titles to the wrong people or acts of multiple land titling and ownership claims have resulted in destruction of property and killing of people. For instance, the most recent example is the conflict on land located on Block 269 on the prime hill of Lubowa along Entebbe road in Wakiso district. In this particular case, lawyers representing Mitchell Cotts Uganda Ltd. complained that plot marked between 2926 and 2970 had illegally been parceled out on Block 269 at Lubowa Hill. While appearing before the lands inquiry commission, Ms. Louella Ataro the former Wakiso district land Registrar and now a senior Registrar of titles at the Ministry of Lands revealed to the commission that she was approached by Simon Katoyingi, a records officer attached to the ministry zonal office in Wakiso, and offered a lot of money to sign certificates of title on Block 269 in Lubowa but resisted the bribe after discovering the irregularities regarding individuals who were processing the titles and the fact that the land in question had a valid freehold land title issued in 1931 belonging to Mitchell Cotts Uganda Ltd. When Ataro was transferred to the ministry of Lands in Kampala, the Wakiso land office went on and processed titles for this land which has now turned controversial with a number of individuals, private and government institutions laying claim over it. Major General Kahinda Otafiire the minister for Justice and Constitutional Affairs, Hassan Ssemujju, Ibrahim Mulumba, Aloysius Sseruwagi, Willis Murozi, and Global International Alliance Limited are some of the people and organizations whose land title on this land are to be cancelled over fraudulent acquisition. Brigadier Kasirye Gwanga and the National Social Security Fund claims part of it. On the same block is a proposed multibillion specialized international hospital whose groundbreaking was witnessed by President Museveni on 1 June 2017 but has since failed to take off as project financiers reportedly pulled out awaiting the settlement of the land wrangles (Wambi 2017).

Collusion between government land valuers, land speculators, and owners to inflate or undervalue land for government acquisition especially for infrastructural developments such as roads, electricity transmission lines, dams, oil refinery pipeline, and railway construction among other is also escalating land disputes in Uganda. It has been common knowledge for some years now that public officials who design infrastructure projects rush to the same areas and purchase tracts of land well aware that a project is going to be implemented there. Land prices then shoot up and when the time for compensation comes, they demand much more because they created artificial demand in the first place. In other cases, they leak government plans about the establishment of given infrastructure thereby causing artificial escalation of land values (Mayiga 2017). In other instances, they connive with land and property owners in those specific project locations and inflate the value of land and properties and then

share the inflated returns. For instance, Mr. John Moses Magala, a senior government valuer, was accused of inflating land compensation value for Kampala-Entebbe Express way to a tune of Shs 3 billion, inflating the cost of land in Nsambya (Kibuga Block 7 Plot 16A-28A) from Shs 50 billions to Shs 183.2 billions, paying ghost compensation claimants on the Fort-Portal-Bundibugyo road and attaching value to land in wetland and forest reserve (Mugerwa 2016).

## Role of Brokers in Land Grabbing Networks

There are also many instances where public officials work hand-in-hand with brokers to grab public or private citizen's land. Brokers are well documented in academic studies as an essential component in corrupt networks. They can design, organize, and execute corruption by identifying deals and linking different actors together, control the flow of information and resources to and from the network, manage social capital, and when partners do not trust each other, brokers can mediate between them and help build trust among network members (see Burt 2005). In the case of Uganda, brokers have been revealed to engage in similar roles and fuel a lot of land grabbing and conflicts. For instance in July 2017, Hon. Ronald Kibuule the Mukono north Member of Parliament and minister of State for Water illegally acquired an 85-acre piece of land on block 369 Plot 10 in Kigaya-Golomolo Buikwe district and evicted over 140 households from it (Kasozi and Namyalo 2018c). Under questioning by the commission of inquiry into land matters, Hon. Kibuule asserted that he was looking to buy land touching water when brokers who knew about such land approached him. Kibuule argued that he never visited the land but asked the brokers to do due diligence to establish if the land had any encumbrances and the owner. He noted that upon search, the brokers established that the land was registered in the names of Musa Kateregga and was encumbrance free. Without visiting the land, Hon. Kibuule held a meeting to streamline the process of purchase, paid a deposit of Shs120 million for the 85 acres and in July 2017, he was introduced as the new landlord. He deployed armed security personnel in the area, brought graders and started leveling the land while destroying people's crops and homes. People were forced to flee, others were arrested and kept in detention. Ms. Sanyu Nassali a tenant on this land told the Justice Catherine Bamugemereire-led commission that her husband Dickson Wasswa was forced to flee his home to stay in the bush before his arrest, torture, and killing. The Golomolo LC I chairman Mr. James Banda was also detained and tortured but he survived. Apart from Hon. Kibuule, the same land is contested by other illegal registered landowners include senior police officer, Mr. Guston Twinamatsiko, businessman Musa Kateregga, Eldard Mugisha, and Mbowa Mudasil (Kasozi and Namyalo 2018c). In another example, it was also revealed by the Lands Inquiry Commission that in July 2017, an illicit land deal organized by two brokers was effected with the help of a top government minister, a rich businessman, police officers, members of the Uganda land commission, and the judiciary that resulted in the displacement of hundreds of people occupying a building on government land in Jinja district. The land in this case was government land on Plot 60/62 Alidina road in Jinja District with a building that was occupied by hundreds of business tenants. The Uganda land commission obtained a 99-year lease for this land/property from the administration of Jinja Municipality. Simpson Birungi, an industrialist and wealthy businessman in Uganda, was approached by two brokers with a deal to help him acquire this property at Shs 2.5 millions (equivalent to US$ 680) on condition that he gave them a commission of Shs 70 million (US$ 20,000). The two brokers were Michael Nuwagira alias Toyota the stepbrother of President Museveni and another one named as Ibanda. Simpson Birungi paid Toyota the asked commission and the two brokers managed the process in which he acquired a lease offer within 3 days. Emmanuel Olauna Orum a former Undersecretary in the Ministry of Tourism told the same Commission that he was pressured to sign a letter of no-objection by Major General Kahinda Otafiire the minister of Lands at the time after

being driven to meet him by Toyota. Birungi took over the building well knowing that there were tenants with whom he never had any discussion. He acquired a court eviction order and forcefully displaced tenants from the property with the support of senior police officers.

## Role of Military Officials in Land Grabbing Networks

Besides brokers, top government politicians, and investors, top serving army officers have been reported to directly engage in land grabbing or help groups involved in the same activity. For instance on January 11, 2018, the commission of inquiry into land matters clashed with Military Police Brigade officers over 450 acres of Kajjansi Central Forest Reserve and wetland located in Wabusange village, Katale zone, Wakiso district. This land belongs to government, which leased it to local people to plant eucalyptus trees and preserve the wetland. However, after an alarm raised by displaced locals, the Bamugemereire commission visited the place and discovered that actually the local tree planters were displaced by Mubiru and businessman Ephraim Ntaganda without compensation and those that refused to vacate, woke up to find that their trees had been cut down, their trunks uprooted, the wells and swamp filled with gravel. For over 5 years now, military men have guarded the place, cutting off over 100 families from accessing water for domestic use. Joseph Kiggundu an excavator driver working for Mubiru told the commission members that he had always suspected the activities of his boss and Ephraim Ntaganda to be illegal but was surprised when he was arrested but Mubiru took him out of prison with a court order. As the commissioners were still inspecting the land, two military pickups full of Military Brigade soldiers commanded by Major Edson Akanyihayo came brandishing military batons and sticks to whack whoever was on that land only to find that it was Justice Bamugemereire. When it dawned on Major Akanyihayo that he was going to be in trouble, he claimed that locals who informed him about the presence of encroachers raised him yet Mr. Mubiru had a court order stopping anyone from trespassing on the land until the main court case is decided. Maj. Akanyihayo was not arrested but taken by the commissioners to record a statement and explain why he was protecting an illegality. In 2017, the commission had visited another part of Kajjansi forest reserve where Mr. Ntaganda had been accused of grabbing 297 hectares of land from tenants (Amamukirori 2018). In 2017, over 120,000 families were displaced and their properties destroyed from over 207.8 Square Miles of land by a joint force of police, military police, and regular UPDF army soldiers to clear way for gold mining by Gemstone International partly owned Ms. Gertrude Njuba a State House official in charge of directorate of land in Bukuya and Kitumbi Subcounties in Mubende district. This was done following a directive from State House and in total disregard of the area MPs writing to the President requesting for more time so that people would organize themselves to take away their belongings including animals and harvesting of their crops. In total disregard of this request, houses and shops were razed down; soldiers and police ate domestic animals and properties like iron sheets were sold to scrap dealers (Witnessradio.org 2018).

## Conclusions and Recommendations

From the above presentation of land disputes and many more investigated cases but not reported here, it is very clear that well-positioned government officials (especially land registry officials, top politicians, police and army officers, RDCs, and judicial officers) or those with close economic, social, kinship, or political ties to them (especially brokers, business people and investors) are part and parcel of the collective corruption problem in Uganda. While their role in perpetuating land grabbing has been clearly brought to the fore by the commission's investigations, it remains to be seen whether adequate punishment will be equally accorded to those implicated. Previous experience has shown that punishing corruption or escaping its punishment

in Uganda can be political. With supporters of the regime going scot free while those opposed or perceived to be critical to the regime or President Museveni paying a heavy price and this extends to other well-documented corruption scandals not necessarily related to land that have gone unpunished (see Human Rights Watch 2013). This impunity is not accidental but deliberate because these corrupt officials and their networks are the ones drumming up and fighting so hard to make sure that Museveni stays in power. Some like Kibuule and Kahinda Otafiire are even ministers and they are not alone. Others like Abid Alam are wealthy businessmen known to contribute to election campaign finance. On the other hand, it was noted that his strongest political opponents are mainly trumpeting against corruption. Therefore, it is in his political interest to support those who support him or at least let them off the hook as a method of political patronage. The main recommendation given in this paper is that to stop the land conflict hemorrhage in the country, severe punishment must be handled to all implicated without fear or favor especially for those with high political connections. The laws must be strengthened to also be able to punish people such as brokers who are now walking free because the laws are weak and do not cover them.

# Corruption

Staffan Andersson
Department of Political Science, Linnaeus University, Växjö, Sweden

## Synonyms

Abuse of power; Bribery; Conflict of interest; Favoritism

Corruption of politics and public administration is a problem that sees no border in terms of geography nor is it limited in time. It is not restricted to one or the other country or political level and affects societies and people in their daily lives. Corruption thus has become a major issue in many countries due to its negative effect on trust in politics and administrative processes, economic efficiency, international trade, equality, and poverty reduction. Politically, the fight against corruption is a high priority in many countries and corruption is also often a prominent issue in election campaigns and between competing political parties and candidates. Recently, we have seen this in countries such as Brazil, India, the Ukraine, and Spain. In the latest US presidential election issues concerning campaign finance, the extent of the influence of wealth interests on the political agenda, and political priorities of parties and candidates have been at the forefront. Moreover, revelations that large international companies have been involved in corrupt contract deals have come under scrutiny, not least when it has concerned payments to undemocratic regimes. Simply put corruption is of concern across countries and political systems.

Next the entry turns to the increased interest for corruption and its impact. Then, sections follow on what corruption is and how it can be assessed. The penultimate section discusses combat of corruption and its causes before concluding.

## Why Has the Focus on Corruption Increased? Why Is It of Such Concern?

Research interest for corruption has varied over time and in focus. Till the 1980s the focus was mainly on developing countries and explaining why corruption was pervasive there. Scant interest was given to developed countries with established democracies where corruption was perceived as an insignificant issue. This notion changed in the 1990s when the Cold War division of east and west ended. First, countries in the West became less and less willing to support corruption in client regimes in poor countries or look the other way. Increasingly demands were raised concerning democratic institutions and anticorruption reforms. Moreover, corruption scandals erupted in established, major Western democracies such as the USA, Germany, France, and Italy. Such scandals made it difficult to sustain the notion of high-level political and administrative corruption being almost solely a concern for developing countries. In line with this, research and media in rich, democratic countries ever more started to note corruption problems in their own countries (e.g., Andersson and Heywood 2009; Heywood 2015).

Another key development was the changed approach of important international organizations.

The Organisation for Economic Co-operation and Development (OECD) took an early interest in corruption combat, given the distortive impact of corruption on international trade. In 1997 OECD (2016) adopted the Convention on Combating Bribery of Foreign Public Officials in International Business Transactions. The convention has played an important role in harmonizing the way countries deal with issues in relation to how to deal with and sanctioning international bribery in the home countries of bribe payers. Also other international organizations – such as the UN, the Council of Europe, and the World Bank – started to pay more attention to countervailing corruption. The World Bank changed from viewing corruption as an untouchable issue and something that would be against its statues of non-interference in political issues to view corruption as one of the most important obstacles for economic development (Marquette 2004). Thus, both in multilateral and bilateral aid today, fighting corruption and establishing good governance are seen as a necessary part of supporting sustainable development (e.g., Kim 2014; Wolfowitz 2006).

The formation of Transparency International (TI) in 1993 was a key factor in putting corruption on the international agenda. Its annual corruption perceptions index (CPI), a measurement of perceived corruption across countries, received much publicity among media, national and international organizations, and academics. This index made empirical country data accessible which contributed (together with other similar measures) to make it easier to investigate quantitatively how corruption was related to other factors such as democracy, political stability, and economic development. Nowadays, the improved accessibility to data and information enables more knowledge about corruption (See e.g., The Quality of Government Institute 2016).

## Effects of Corruption

Empirical research in general points to corruption as having negative impacts on societal level due to its effects on governments such as trust in due process, fair elections, and the market in terms of being a disincentive to investment and trade, and distorting resource allocation. It has costs that could also be measured in social and environmental terms as the everyday life of ordinary citizens are impacted. As difficult as it is to estimate the costs of corruption in economic terms due to its hidden nature and various shapes, the World Bank (2016) estimates about $1 trillion annually to be paid in bribes and the total economic loss from corruption to be much higher especially in poorer countries and by poor people.

This does not however rule out individual actors perceiving benefits from corrupt transactions. Think of a company who receives a contract by giving favors to decision-makers, or a person that requires acute health care and has to pay an unofficial fee not having to wait, or a person wrongly accused of speeding by a police officer being charged unless paying a bribe. In a corrupt environment, the corrupt choice might be more about fearing the negative consequences of extortion rather than an active choice regarded as something positive. This also points to the importance of understanding what structures and norms that are facing actors and to what extent these structures and norms support or prevent corrupt actions (e.g., Rothstein and Teorell 2015).

## The Magnitude of the Problem

There is a sense of corruption being a growing problem as judged by public opinion surveys in countries (e.g., Afrobarometer 2016; Transparency International 2015), and the frequent scandals concerning politics and business also in established democracies. However, this might also be related to the increased interest from citizens, media, governments, and international organizations, exposing corruption and putting it high up on the agenda. Watchdogs are being established, and ombudsmen, anticorruption agencies, the police, and prosecutors office play an important role in informing about, pursuing, and sanctioning corruption. Moreover, media plays an important role in exposing corruption in many countries and has often had a pivotal role in the exposure of scandals. The Watergate scandal in the US concerning illegal activities and their cover up in the re-election campaign of President Nixon in the 1970s may be the most known case. Also, the sense of increased corruption might also

be related to issues of measurement. A perceived increase in corruption raises questions about to what extent this concern an increased number of corruption incidents, its total value, and what corruption that is included or in focus.

## What Is Corruption?

Defining corruption is important in terms of being precise with what we are studying, assessing, and how to fight it. However, this is contentious as corruption is a multifaceted phenomenon that might vary with the context and over time.

Dictionary definitions of corruption tend to focus on morality and bribery (an official asks for or accept an offer from the other party in order to consider the interest of that party), which is a core type of corruption. The word corruption is derived from Latin where "Corruptio" means depraved condition, state of decay or bribery. The online Oxford Dictionaries (2016) defines corruption as "Dishonest or fraudulent conduct by those in power, typically involving bribery".

Social science definitions have tended to point to the breaking of norms concerning public roles or resources for private or personal gain (e.g., "Corruption," 1995) and have historically emphasized how the political system and society are negatively affected by corruption (Friedrich 1989, p. 16). The famous dictum by Lord Acton on how "Power corrupts and absolute power corrupts absolutely" points in this direction and to the importance of accountable power.

Transparency International provides one commonly referred to definition: "Corruption is the abuse of entrusted power for private gain" (Transparency International 2016). This is a broad and wide covering definition that makes room for inclusion of most of the activities and offences associated with corruption. It is applicable to different settings, not restricted to law breaking, and covers corruption where public power is entrusted to private operators or when private gain is not only for an individual (e.g., to benefit political parties). Such aspects are important given that increasingly the public and private sectors are intertwined and services contracted out to private operators.

There are, however, many contentious factors. For example, should corruption definitions include corruption that takes place within the private sector? In this context of public administration and public policy, naturally the discussion is focused on corruption in the public sphere or at the interface between the private and public spheres, i.e., what is often referred to as political corruption (Heywood 1997, p. 421). Moreover, should definitions be more inclusive or narrower, and how should the abuse criteria above be judged, i.e., against what standard? Let us discuss this by first looking at how generic definitions like the one above with focus on the behavior of actors involved have been distinguished into three categories.

Public office–centered definitions are grounded in the rules guiding public officials in their duties (e.g., Nye 1967, p. 419). However, one caveat in relation to using formal rules as the standard for misuse is that not every illegal action is corrupt and actions judged as corrupt by moral norms might not be illegal.

In public interest ("the interest of a collectivity, usually the state, as distinct from individual private interest or group interest" (Lawton et al. 2013, p. 30)) definitions corruption is indicated by the common interest being disregarded to promote private interest (Warren 2015). Accordingly, actions might be corrupt but not illegal. Also, questions arise about how to define the public interest?

Public opinion–based definitions let the public define corruption. An advantage is that it allows researchers to define corruption, while potentially having problems if opinion is divided, difficult to determine, or changing.

Let us now turn to Warren (2015) and Kurer (2015), respectively for a more detailed discussion of arguments for public interest definitions, which allow for a broader theoretical discussion, or public office definitions, which for empirical and comparative purposes might be easier to use, and standards for determining when abuse occur.

Warren views the normative core of corruption as when institutions and practices that should enable democratic inclusion instead are duplicity undermined for the purpose of exclusion (Warren

2015, p. 48). It is a broad definition based on public interest. It is though not contested that public office–centered definitions have their strength in enabling a focus on accountability standards for public office holders, serving as a guide for how to set up institutions to avoid corruption and defining corruption in the executive government sphere of society. Instead, it is regarded as somewhat outgrown in contemporary democracies and less suited for understanding corruption in other spheres such as the legislative sphere or the market. He gives as an example of how the office-based conception of corruption that public officials should act impartially in the public interest, ideally insulated from political pressures, does not work in relation to political representatives: Their role rather is to define the public interest in response to pressure from various interests, thus partiality being part of their job.

Therefore, Warren (2015, p. 49) argues for a corruption concept taking into account the way norms of inclusion, kinds of corruption, and damage done to inclusion vary depending on type of institution/sphere we are dealing with. If not, common but less obvious forms of corruption in democracies will otherwise be missed such as when the purpose of an institution is bent by undue influence. Think for example of the discussion of how members of the US Congress receive campaign contributions from wealthy donors and the way this may affect their task in representing people and whether they listen more to these interests and their issues than the public in general (Lessig 2013).

Kurer (2005, pp. 223, 229, 2015, pp. 37–38) pinpoints the problem with definitions as what standard to be used for the "misuse" of public office in definitions. He is very critical to definitions based on public interest, viewing it as too difficult to define. On the other hand basing misuse on legal rules is too narrow as it will rule out corruption just because there are no laws against it. So he argues for using public opinion of what constitutes violations of duties, of equity norms guiding distribution of rights and duties of officials. He argues against the often held position that public opinion would vary too much for comparative purposes. Instead he points to there being a common understanding across societies and cultures of what is corrupt where violation of impartiality in the exercise of public authority is a central aspect of the understanding of misuse (see also Rothstein and Torsello 2013).

In terms of studying corruption empirically corruption studies complement broad definitions as above with typologies. It is important to consider various types of corruption for the understanding of causes, effects, and how to effectively countervail corruption. Bar bribery, other corruption types concern, for example, favoritism (abusing authority to benefit family, party, or friends), embezzlement and fraud (undue private gain from the organization or citizens by misleading others or disregarding professional responsibilities), and conflict of interest (in general situations where an official has self-interest that conflicts with the obligations to carrying out duties for the public good, this could be due to outside interests such as jobs or gifts from third parties) (for further discussion and references see Andersson 2016).

The characteristics of typologies depend on the purpose and focus of study. Typologies can for example be based on what level of politics/public administration that is involved (grand versus petty corruption), what type of actors are involved, type of transactions involved, level of government and the effects. The famous typology developed by Heidenheimer (1970) categorizing corruption into black, gray, or white provides us with an example. This classification is based on the seriousness of the corrupt acts (petty, routine, or aggravated corruption), the type of society in relation to how political obligation relationships are ordered (family, patron-client, modern boss-follower (political machines), or civic-culture based systems), and the tolerance of various behaviors. So it presents a model for studying corruption perceptions of elites and the public and variation across different political systems.

## Corruption Assessment

To measure corruption is important in order to assess the scale of the issue and what the problems

are. It can also help in identifying variables related to or causing corruption, where action is needed, and when deciding what action to take. But it is also difficult to do due to the hidden nature of corruption and its many shapes. Even when looking at corruption in the same location the understanding of corruption and its definition might change over time (Anechiarico and Jacobs 1996, p. 14). Such problems raise questions about whether it is possible to know if there is more corruption in some places than others, and whether corruption has increased or decreased. Given these difficulties, what are the limitations and possibilities and how can corruption be measured? Corruption research uses various qualitative and quantitative methods and data sources to investigate corruption such as survey data, media reports, and legal cases.

The following will look at some possibilities of doing this. First, corruption is not only about bribery but such forms, which are also legal offences and "hard evidence", are easier to focus on. But as Johnston (2005, p. 6) has noted, during the 1990s a consensus developed that regarded corruption as almost equal to bribery, which especially in rich countries with established democracies might be justified but also only the tip of the (corruption) iceberg. Thus, patterns of corruption, with adhering types of corruption, vary across societies, this being a reflection of combinations of political participation and the strength of institutions in society. This also points to the risk that measures are variously fit depending on the context that they are applied to.

There are then several measures that are used to gauge corruption, for example, looking at (i) deviance from a specified norm, (ii) arrests for corruption violations or unethical conduct specified by for example constitutional provisions, statutes, and administrative regulations, (iii) victimization surveys, (iv) cases reported in the media, and (v) perception of corruption based on experts or the public as respondents.

Using various such ways is important as it is difficult for one perspective or source alone to give a full picture of the problem. Moreover, different measurements are suitable for different tasks. For example, using arrests or legal cases gives access to hard and accessible data but if we want to compare between different systems or countries, what does a varying degree of corruption then say? Is a higher number of cases in one country then an indicator of high corruption incidence or rather a measurement of an efficient prosecutorial and legal system catching a higher percentage of offenders?

This leads over to an important methodological distinction: survey assessments based on the own experience of corruption of respondents or assessments based on their perceptions. To give an example of the difference, say that the purpose is to assess bribery in various institutions in a country. Based on a perception method one could simply ask the respondent to rate each institution on a scale from 1 to 5 in terms of how corrupt each institution is perceived. Using an experience based method would instead first ask whether the respondent have had any service contact with each sector. For those sectors where such contacts were established follow-up questions could be asked about whether the respondent had experienced corrupt actions, (for examples of experience based or perceptions based questions see e.g., the Global Corruption Barometer) (Transparency International 2015).

As earlier noted, from the 1990s empirical studies of corruption developed rapidly not least as a result of easier access to country-level data that became standard for comparative research (e.g., the CPI and Worldwide governance indicators and World Bank 2015). Such data contributed to important findings, for example, regarding the relationship between corruption and democracy, institutions, and economic development (for a classical example see Mauro 1995). But there are also problems related to these standard cross-national measurements concerning their empirical foundations, the downside if using perceptions to measure real corruption levels and the varying correspondence of perceptions and experience measurements. Moreover, while country-level measures assigning each country a single score can grasp cross country variation in corruption levels they cannot do so for variation across government levels and sectors within a country. To better understand corruption and what measures

to take against it, these effects need to be considered (for further discussion and references see Andersson 2016).

## Combating Corruption and Its Causes

As economic and institutional circumstances vary across countries especially between rich and poor countries there is no single panacea of reform of how to combat corruption. Successful action against corruption need to take into account forms of corruption important in the specific context, institutional conditions like the strength of institutions and depth of public participation, and political support for various actions (Johnston 2005). In the following, examples will be given from work at the international level followed by examples of the relationship between national corruption reform and public administration.

As noted above, international governmental and nongovernmental organizations have increasingly emphasized the importance of countervailing and combatting corruption. The United Nations and the World Bank are two such examples where states try to find common ground for actions against corruption.

In the United Nations sustainable development goals of the 2030 agenda for sustainable development reducing corruption is an important part. In the 16th goal about promoting just, peaceful, and inclusive societies, one target is to "Substantially reduce corruption and bribery in all their forms." The legally binding United Nations (2016) Convention against corruption entered into force 2005. It includes measures concerning prevention, international cooperation, criminalization (of domestic and foreign bribery, influence trading, embezzlement and money laundering), and asset recovery. Preventive measures concerns transparency of political financing, establishing anticorruption bodies, safeguarding public services by promoting efficiency, transparency and merit based recruitment. It requires public servants to be subject of codes of conduct, financial disclosures and sanctions. The convention asks for promoting transparency and accountability of public finance, and establishing certain requirements for corruption prevention in public procurement and the judiciary. It further points to the importance of active involvement of citizens and nongovernmental organizations.

Given the important role of the World Bank as a financier of loans for development in poor countries it has a central role concerning corruption reform in these countries. It has promoted a good governance and anticorruption agenda (World Bank 2011), also adopted by many other aid agencies. Good governance has concerned aspects such as increasing political accountability, strengthening civil society participation, creating a competitive private sector, improvement of the public sector, and strengthening the judicial system and rule of law. As expressed by Kaufmann (2005, p. 88) corruption is not to be fought by fighting corruption (i.e., more anticorruption campaigns, more anticorruption commissions, new laws, and codes of conduct) but rather by focusing on indirect measures aiming at the broader political and economic structures. But it is also difficult to fight corruption when it is established on high levels so the success of anticorruption programs has been rather modest. Another reason is the initial reliance on using one size fits all programs without giving enough consideration to different types and levels of corruption, and situation specific causes. The World Bank (2016) and other donors subsequently gave this more attention in later work and initiatives.

Let us now turn to examples of domestic anticorruption reforms in order also to look at its relation to the development of public administration using the case of the USA. In their work with particular focus on New York City, Anechiarico and Jacobs (1994, 1996) show that corruption control efforts have impacted on the development, structure, and operation of public administration. It has aimed to enforce legitimate government authority, controlling employees and private sector clients, but also to increase government efficiency and effectiveness. They also recognize how corruption scandals have been important triggers for introducing more controls of public officers.

Five archetypes or visions of corruption control are identified over the study period (about the

1870s to the 1990s). Reformers of each era have added rules, procedures, and institutions to fulfill a vision of corruption free government. Much of the first three visions goes hand in hand with creating modern bureaucracy along Weber's (1946, pp. 196–198) legal rational lines, including moving away from political patronage to a civil service where officers are employed on basis of professional merits. Recent research has also shown meritocratic recruitment to have a significant corruption reducing effect, while this is not the case for some other often referred to bureaucratic factors, e.g., salaries of public employees and internal promotion (Dahlström et al. 2012).

The era of antipatronage vision of corruption control (1870–1900) identified partisan control of personnel in public administration as the cause of corruption. Many American cities were controlled by so-called political machines that were trading services and favors for votes and contracts. To secure the integrity and competence of employees, merit-based appointment system and professional public administration were introduced. Testing credentials of applicants, peer enforcement of organizational norms, and personal controls were central to uphold integrity, combined with a belief in the public service spirit of professionals (Anechiarico and Jacobs 1994, pp. 466–467).

The progressive vision (1900–1930) similarly viewed partisan and unprofessional administration as the main cause of corruption and called for a complete reform of the political system (e.g., electoral reform, increased administrative expertise, apolitical administration). To accomplish democratic accountability and efficiency, corruption control was regarded as necessary and peer review and professional ethics as integral parts of upholding integrity (Anechiarico and Jacobs 1994, p. 467).

The scientific management vision period (1933–1970) in time coincides with the birth of the large more complex formal bureaucratic organization. Building on progressivism it pointed out for the industrial society inadequate organizational design and external controls rather than ethics or politics as the cause of corruption problems. A vision of government free of corruption took hold as did a drive to know what was happening all throughout administrative organizations. The key policy prescription to prevention and exposure of corruption was to reorganize and centralize government and comprehensive monitoring and evaluations (Anechiarico and Jacobs 1994, p. 467).

Thus, overall the control approaches were initially much ethics based (Reliance on development of internal controls to stimulate ethical behavior, ethics training, education, advise (Lawton et al. 2013, p. 117)) relying on transferring a patronage run administration into a professional civil service with trust in professionals and their development of internal ethics motivated by a public service ideal. But over time more and more corruption controls were added, increasingly including external controls.

When moving into the panoptic (cf. Bentham, Focault) vision of corruption control (1970-), this trend fully materialized moving towards a more compliance based (Using external controls of unethical action such as laws and rules (Lawton et al. 2013, p. 117)) approach of control relying more on external control, surveillance, and legal investigative approaches, the aim being to know everything going on. This period starts at the time of the Watergate scandal that spurs new ethics legislation and increased investigative powers. Public administration is seen as plagued by corruption opportunities due to inadequate monitoring of corruption. Main reform proposals build on the previous visions but are extended to new levels striving for total information about administrators' performance. Surveillance, investigative bodies, and fiscal controls (audit, ethics offices, investigative agencies, media) are used to do so, and to avoid both actual and perceived corruption and conflict of interest, while de-emphasizing issues of recruitment and training (Anechiarico and Jacobs 1994, p. 468).

But as Anechiarico and Jacobs concluded, effectiveness was negatively affected and administrative reforms made more difficult when ever more controls were added. Morale was affected by constant surveillance. Moreover, reduced discretion of professional public officers might not just reduce risks for corrupt actions but also hamper

flexibility and their role in carrying out services. This led to critique of corruption control being viewed in isolation from the potential trade-off between anticorruption and administrative efficiency goals, and contributed to a reinvention movement. This revisionism perspective (1990-) regards corruption control (e.g., regulations, financial disclosure, whistle-blower protection, debarment from contracts) as a problem making recruitment more difficult, contracting processes less efficient, and organizations more inward looking. Overall, revisionists view traditional public administration and bureaucratic procedures and regulations as costly, rigid, and the main cause of corruption. Thus it calls for market privatization, businesslike methods, entrepreneurship (D. Osborne 1993), and debureaucratization, much in line with the New Public Management (NPM) trend at the time (Anechiarico and Jacobs 1994, pp. 468, 471).

At the time of the work of Anechiarico and Jacobs, the revisionist perspective had not affected the practice of public administration that much. The NPM perspective though became very influential from the 1990s and onwards in terms of impact on public administration and its operation. Later on the NPM model in turn become ever more criticized for subordinating values of public interest and citizenship to market values (Denhardt and Denhardt 2000, p. 557). NPM's promises of cutting costs and improved performance as judged by its results in the UK, one of the frontrunners in implementing the NPM agenda, instead points to costs being somewhat higher, performance somewhat worse, while perceived consistency or fairness of government administration worsened (Hood and Dixon 2015, pp. 180–183). This agenda was also found to require extensive external control, which is precisely what the revisionists critiqued traditional administration for.

So where do we stand now? Will compliance perspectives be dominating or perspectives more reminiscent of the earlier periods of visions of corruption control with a focus on ethics and internal control? This will be related to other developments in what management models are used and the organization of public administration, where parts of the NPM agenda is still much in vogue but challenged by other alternatives critical of the market value focus (Denhardt and Denhardt 2000; S. P. Osborne 2010).

## Conclusion

As noted in the previous section corruption control and reforms are related to the way corruption is defined, assessed, and the way public administration is organized. Corruption as a concept and its empirical manifestations are not static. This is seen by challenges provided over the last 30 years by the increased public–private cooperation in public administration. In order to increase efficiency and improve performance, public administration has been influenced by market models and management. Contracting out, public–private partnerships, and privatization of public services have become important components.

This development with a changing role of the state with a mix of public and private actors involved in public administration also blurs the line between what is public and private interest and who is responsible for making and implementing public policy. Even where institutions are strong, when decisions and activities increasingly are made in the private sphere, through markets or market like processes, with less restrictive rules and mechanisms of accountability, this also affects whether certain actions are viewed as corrupt or not (Johnston 2005, p. 12). It also impacts on how corruption manifests. Especially in established democracies with developed economies and strong institutions that have to some extent adapted rules to fit wealth interest, corruption takes new more invisible forms and sometimes within the limit of legal norms but harming public values and hinder participation in democratic institutions. Thus, what is legal might sometimes be corrupt!

This points to the need for anticorruption reforms with a focus not only on the individual level of corruption but also the institutional level. When what is perceived as corrupt, as for example many would opine in regard to the effects of wealth on US elections in terms of to whom politicians and democratic institutions respond, this raises questions about how reforms in public

administration can deal with corrupt dependencies, duplicitous exclusion, and reduced participation in democratic processes. This is an important challenge to heed in the pursuit of low corruption and strong democratic accountability, at the same time as demands on public services are increasing and economic resources are strained.

## Synonyms

Corruption; Development; Singapore; Uganda

## Definitions

Corruption in this entry is defined as the abuse of public power or authority for private benefit or profit (see Johnston 2010). In this entry development is defined as a continuous and holistic process of improving people's lives and the environment they live in (Chambers 2004). Uganda is a sovereign country located in East Africa with an estimated population of 39,570,125 people and GDP of US$26.35 billion and has corruption which is endemic (Uganda| CIA Factbook 2018). Singapore is a sovereign country located in South East Asia with an estimated population of 5,888,926 people and GDP of US$323.9 billion and has very low levels of corruption (Singapore| CIA Fact Book 2018).

## Introduction

There is no agreement among scholars or development practitioners as to how corruption affects or influences development. There are scholars who have argued that corruption may be economically desirable in certain circumstances, may potentially improve efficiency, may help growth and development especially in developing countries with significant natural resources such as oil, and may help inefficient, inept, and mismanaged bureaucracies by greasing the wheels (Bardhan 1997; Looney 2006; Kutan et al. 2013). On the other hand, there are also other scholars and empirical evidence which suggest that corruption is one of the greatest obstacles to economic and social development around the world because it redirects resources in unproductive areas where bribes can be easily sought and this can distort an economy (Khan 2006). This entry specifically discusses how corruption influences the key ingredients that facilitate the development process such as leadership, investment decision-making, protection or plundering of public resources/investments, generation or loss of revenues, and the practice of politics and elements of development such as education, health, and public investments in Uganda and Singapore.

## Why Compare Uganda and Singapore?

Studying these two countries is quite interesting because both countries were colonized by Britain and got independence around the same time between 1962 and 1965. In those years, Uganda was generally more developed than Singapore, and many commentators predicted that masterminding an economic success was quite possible for Uganda because the country is naturally blessed with a very good climate, is very rich in mineral resources, adopted a Westminster system of government complete with an official opposition party, and had a fairly disciplined civil service, an independent judiciary, a relatively good performing economy with an annual growth rate of 3.3%, and relatively low levels of corruption. On the other hand, when Singapore separated from Malaysia on 9 August 1965, the country's future was so bleak that few people believed it could survive for 3 years. Its own founding Prime Minister Lee Kuan Yew broke down publically and cried because he too was not sure the country would survive on its own. It had no natural resource, its economic growth rate was 2.4%, and corruption inherited from the colonial government was endemic. Uganda had better prospects and was more developed than Singapore generally, and in 1965 the Singaporean government sent officials to East Africa to look for business though few trade followed after that (Rajivan 2008; Lee 2011). Fifty-five years forward, Uganda is one of the good stories gone badly. It is still a third world country with GDP of US$26.01 billion; corruption is an endemic way of life, is ranked among the worst countries in respecting the rule of law, has low Human Development Index scores when compared to its former peers, has consumed most of its independence life in wars, and has never experienced a peaceful transfer of political power from one president to another. On the other hand, Singapore has for many years been ranked among the least corrupt countries in the world and had the world's fastest growing economy between 1960 and 2000 at the rate of 8–9%, its people have access to world-class healthcare at a reasonable price, a life expectancy of 84.07 years, an education in world-class schools built by government, and one of the best standards of living in the world with a gross national product per capita higher than that of most developed countries including Australia, Canada, France, Italy, German, the United Kingdom, and the United States (Lee 2011).

## Corruption and Leadership

Singapore was blessed with an exceptionally brilliant, determined, pragmatic, farsighted, courageous, and astute leader in the person of Lee Kuan Yew who was ready to do whatever it took to develop and defend Singapore. A fourth-generation Peranakan Chinese Singaporean Lee Kuan Yew was born on 16 September 1923, was graded top Malayan boy in the Cambridge Senior Examinations, and later excelled in law at Cambridge University. He returned to Singapore in 1950, gained public attention as a lawyer defending trade unions and was a founding member of the People's Action Party that won elections in 1959 (Ghesquiere 2011). Lee Kuan Yew likened administering a country to managing a corporate entity: If its managers mismanage a company's resources, then it would go bust; if management is efficient, dedicated, and know what they are doing, the company will prosper. The same applies to a country: if those entrusted with public resources or authority in a country uses them for private gain, the country will go down the drain. In this regard, a corruption-free, determined, efficient, and effective leadership must be instituted first if development is to be achieved especially in a poor developing country. Immediately after coming to power, Lee Kuan Yew and his People's Action Party (PAP) government deliberately established a meritocratic system of governance that attracted people of good education, character, sense of reality, imagination, intelligence, dynamism, courage of their convictions, high motivation, integrity, and leadership into government. Opportunities were given equally to all citizens regardless of race, language,

culture, age, sex, or religion. Recruitment, promotion, and reward in the Singaporean civil service, government statutory bodies, and companies were and still are based on their contribution and performance rather than seniority or personal or group connections; for instance, headmasters were recruited, promoted, or demoted in part based on the results of their schools. Promotion in the civil service was based on results achieved through actual policy execution and on potential capability, and quite remarkably, this principle extended upward to include political leaders such as parliamentarians and ministers. In each election the PAP forced a painful measure on one third of its parliamentarians by telling them not to seek reelection. As a result of all these, the Singaporean public service was built on talent, competence, and professionalism that enhanced efficiency and effectiveness in service delivery (Mauzy and Milne 2002). An effective, professional, and non-corrupt public service and political leadership moved Singapore from humiliating poverty in the 1960s to spectacular wealth by 1990. After achieving first world status, it was no longer sufficient for old guard leaders to hold onto office if Singapore was to sustain its prosperity. Lee Kuan Yew started the search for possible successors in the 1960s. By the early 1970s, he made it clear that he was not looking for successors from among the party's old guard. By 1988, only Lee Kuan Yew remained in the Cabinet among the old guard. He stepped down from power in 1990 on the 25th anniversary of Singapore's independence aged 65 and gave an opportunity to a competent, tested, and young generation of leaders to continue Singapore development (Sonny et al. 2009; Lee 2011). On the other hand, Uganda's past experience offers an example of what can go wrong when you have wrong people as leaders of government. Just 10 years after independence in 1972, Idi Amin captured power through a coup d'état, and his first act was to expel Ugandans of Indian origin and distribute all their wealth and property to his cronies. This act of stupidity and madness among other atrocities turned Uganda's promising economy at that time into a tragedy as the Indians formed the backbone of Uganda's economic and professional life. The country could have done better with this section of its people. President Museveni is another leader whose 32 years stay in power can illustrate how corruption in different forms impact development of a country. There is an extensive list of nationalist leaders who successfully led anti-colonial fights for freedom and post-independence liberation movements, but who failed or are failing to groom honest and capable successors, and as a result their countries are steeped in uncertainty, corruption, nepotism, conflict, and poverty, for insistence, former Zimbabwean President Robert Mugabi and the late Libyan Dictator Muamar Gadhafi. Museveni almost fits in this category, and his instance to stay in power through repression and political patronage puts the modest development achievements made in the last 50 years in jeopardy. Recruitment, promotions, and punishment in the Ugandan public service today are not based on merit but rather on social connections and patronage, which has bloated the public service with mediocre talent resulting in the ineffective delivery of public goods and services.

## Avoiding Influence Peddling

According to Lee Kuan Yew, the founding Prime Minister of independent Singapore, confidence is the most single one word that explains why foreign investors located their factories, banks, and refineries in Singapore that contributed significantly to its economic miracle. Confidence did not come out of a vacuum but was a consequence of a committed leadership that fought corruption effectively and ensured that there was no influence peddling in giving or denying of contracts, licenses, and permits to investors or misuse of national resources and that peoples or public property was protected from corruption or any other form of abuse. For example in the 1970s and 1980s, Singapore avoided high-level influence peddling that helped her some disasters. This example related to Singapore denying a license to the Bank of Credit and Commerce International whose shareholders included members of the royal families of Saudi Arabia, Bahrain, Abu

Dhabi, and Dubai. The bank that had about 400 branches in over 70 countries applied for an offshore banking license in Singapore in 1973, 1980, and 1982 and was rejected all the time. Among the people that lobbied for it to be granted a license unsuccessfully was Harold Wilson the British Prime Minister. When it was closed down in July 1991 because of dishonest operations, it led to losses of US$11 billion for other banks, depositors, and creditors, and Singapore escaped unscathed because its leaders avoided influence peddling and refused to be compromised. Even when the financial crisis broke out in East Asia and devastated currencies, stock markets, and economies of the region, no bank in Singapore faltered. Singapore did not stop at avoiding corruption at the very high level, but also severely punished it when it was revealed to have happened. For example, in November 1986 one of the associates of Mr. Teh Cheang Wan the Minister for national development at the time admitted under questioning by the CPIB that between 1981 and 1982 he gave Cheang two cash payments of S$400,000 each one in cash to allow a development company to retain part of its land which had been earmarked for compulsory government acquisition and in the second to assist a developer in the purchase of state land for private development. Cheang denied receiving the money and tried to influence the Senior Assistant Director of the CPIB for the case not to be pursued. The cabinet secretary reported this and said Cheang had asked to see the Prime Minister. The Prime Minister replied he could not see him until investigations were over. A week later on 15 December 1986, he was found dead in his bed after taking his life rather than face disgrace and ostracism. Other high-profile prosecutions of corruption set clear precedent that corruption was not a way of doing things in Singapore and this did not only save public money but also attracted many genuine investors (Lee 2011). On the other hand, in Uganda high-level influence peddling for selfish interests especially by senior political leaders and technocrats and impunity on the side of those involved has not only sabotage investments but also directly lead to massive loss of public money. There are so many examples where millions of dollar projects have failed to take off because of influence peddling or direct loss of millions of dollars at the hands of corrupt officials. For example in March 2010, rather than go through a proper competitive procurement arrangement as stipulated in law, President Museveni ordered that Mühlbauer Technology Group, a company that had been recommended to him by the then German ambassador to Uganda, Reinhard Butchnolz, be given a contract to produce National Identity Cards. The company was expected to produce over 3.5 million IDs by December 2010 and around 21 million by the end of June 2012 when the project was supposed to end, but the firm only released 400 IDs; by March 2012, the project had stalled, and government had lost over UgShs 200 billion. The amount of public money lost in similar circumstances at the hands of government of official runs in hundreds of millions of dollars and lost investment opportunities sabotaged because of corruption are also similar. This is aggravated by the fact that most of such cases have happened with impunity. It is such funds and investments that could have provided jobs to millions of unemployed Ugandan youth and contribute to the country's development (see UDN 2013).

## Corruption and the Formation/ Nurturing of State-Owned Enterprises (SOEs)

The Singaporean government took the lead in establishing, nurturing, and protecting state-owned enterprises and industries including a National Iron and Steel Mills, a shipping line (Neptune Orient Lines), an Airline (Singapore Airlines), and a factory for small ammunition and a high-tech company (Singapore Technologies) that among other things set up wafer fabrication plants, assembled cars, refrigerators, air conditioners, radios, television sets, shipbuilding, and tape recorders. When these became successful, government decided to turn state monopolies such as the Public Utilities Board, Port of Singapore Authority, and Singapore telecom into separate entities, free from ministerial control, to

be run as profitable and competitive companies. These were selected after careful evaluation, implemented with extreme precaution, and their performance was continuously reviewed to ensure that they are efficient, market friendly, and profit making. They would be liquidated or merged or closed down if they systematically made losses (Ali 2000). Most enterprises succeeded, and as a result Singapore had a huge SOE sector estimated to be 21.8% of GDP in 1998 (Lee 2011). At independence in 1962, the government of Prime Minister Milton Apollo Obote in Uganda did not only inherit fairly function SOEs from the colonial state but also formed new ones that were performing very well, although most of them were under stress due to Amin's economic destruction. President Museveni and his NRA rebels espoused a vision to build an integrated and self-sustaining economy using a strong socialist-nationalist economic program during their bush war days. Their plan hit a dead end when Museveni turned to donors for aid to help him resuscitate a collapsed economy at the beginning of the early 1990s and was forced to abandon their ideology. Museveni quickly became neoliberal economic orthodoxy convert, and with the guidance of donors especially the World Bank and IMF, he implemented wide structural adjustment policies that included wholesale privatization of state-owned enterprises including those that were even performing better such as the Uganda Commercial Bank, retrenched many government workers, removed agricultural subsidies, and liberalized the economy among other reforms. The proponents of this dispensation credit these reforms for the impressive economic growth and macroeconomic stability Uganda registered from the 1990s to the early 2000s manifested in GDP growth average of 6%, single digit annual and core inflation, stable exchange rate, and tremendous reduction in poverty head count (ADB/OECD 2003). However, it was during the privatization of public enterprises in the 1990s when real massive systematic corruption was executed in Museveni's regime. Almost all public enterprises including those that were performing well such as Uganda Commercial bank were privatized at giveaway prices, and many enterprises were taken over by high-ranking corrupt government. The worst part of the whole process was that the proceeds from the privatization were also misappropriated and not accounted and most privatized enterprises later collapsed in the hands of private owners (Nakaweesi 2015). This is almost the opposite of what Singapore did to achieve an economic miracle.

## Loss of Revenues

High levels of corruption directly or indirectly lead to loss of money such as direct stealing of colossal sums of money by public officials, uncollected government revenue through tax exemptions, and evasion and loss of foreign aid as a punishment for corruption, all of which affect development as juxtaposed between the Ugandan and Singaporean experiences. It is estimated that Uganda has lost over US$5 billion through direct stealing or misuse of public money in the last 18 years (Mugerwa 2016). This is enough money to access safe water to 100% of the population or building at least six referral hospitals and put up a power dam of 600 MW that can supply electricity to 80% of the population. On tax exemption, Uganda Resource Authority and African Development Bank estimated that Uganda lost over US$ 400 million between 2005 and 2010 that resulted into loss of tax effort by 3.1 percentage points (Lwanga and Mawejje 2014). In 2012, as a punishment for continuous mega corruption scandals in the Office of the Prime Minister, the World Bank withdrew US$ 280 million that affected core public projects in health, education, water, and agriculture sectors. In 2014, the Ministry of Finance officials in Uganda admitted to the Parliamentary Public Accounts Committee that they abused billions of shillings in tax exemptions to selected private companies and organizations. For example, BIDCO Uganda Ltd. benefited from a VAT exemption for 8 years and a tax holiday for 25 years where more than Shs 540 billion (US$ 150 million) was lost (Mugerwa 2014). This direct and indirect corrupt loss of money in Uganda has not reduced to date, yet the country's

debt burden both internal and external is skyrocketing through the roof. Now, almost over 30% of the national budget is used to finance these debts, which has left many critical areas such as agriculture and job, creating infrastructure for the youth terribly underfunded, no wonder the resultant youth unemployment is estimated at a staggering 80% or above. In Uganda it involves 15 procedures and 33 days to register a business. At every procedure, there have to be bribe and extortion from incompetent and inept bureaucrats. This is disincentive for investors no wonder Uganda is 150th for cost of doing business (Martini 2013). On the other hand, because Singapore quickly converted itself into one of the least corrupt countries in the world, its government raised sufficient revenue to finance both operating and development programs and established a virtuous cycle of low expenditure, low taxation, high investment, and high productivity which led to the fastest economic growth in the whole world from the 1960s to 1990. The government did not need to borrow foreign funds and had annual budget surpluses year after year when they were in recession (Lee 2011).

## Corruption and Elections

Elections are a key determinant of who governs and how in any democratic society which ultimately influences development in that society. The use of money cannot be avoided in elections, but also commercialization cannot be accepted because it distorts the very essence of elections where by those that spent a lot of money to get elected must recover their costs and also accumulate funds for the next election and the system is self-perpetuating and brings into leadership people who may not serve the will of the voters after paying them. Elections are supposed to be free, fair, and acceptable to all (Chauvet and Collier 2009; Lee 2011). In Uganda, elections are not only commercialized, but the entire electoral processes are all marred with corruption. From the very top at presidential level to the village, there is usually bribing of voters, electoral polling agents, and buying off media outlets so that they can carry out biased reporting; electoral officials are bribed to do ballot staffing, unevenly distribute supplies of voting materials at polling stations, ensure that boxes of the ticked ballot papers disappear before reaching tally centers, or falsify results, and sometimes polling agents are bribed to abandon the polling stations on the election day. The inability to have credible electoral reforms and rampant electoral malpractices has led to loss of confidence in change of government through democratic means and sometimes has led to political strife and strikes where lives have been lost and properties destroyed. The issue of huge money in Ugandan elections is explainable through specific examples. In the 2011 campaign period, President Museveni chaired a Cabinet meeting on 8 December 2010 to request Cabinet to pass a supplementary budget amounting to Shs 380 billion for State House. Most electoral commentators noted that much of this money was used to finance his campaigns. In the 2015/2016 budgets, the government included UgShs 4 trillion (US$ 1.2 billion) which was not properly budgeted for, but people in the inner circle knew that this was meant to ensure that the incumbent won the March 2016 elections. The use of money in elections has also had direct negative impact on Uganda development in the past. For example, after elections most candidates find themselves in unpayable debts; at national level, after every election, Uganda finds itself in serious inflation; most investors withhold their money, and there are always violence and court disputes against electoral outcomes (Tangri and Mwenda 2013). On the other hand, Singapore avoided the use of huge amounts of money to win elections that has had a direct bearing on its development. Both the ruling party and the opposition kept election expenses small and well below the amount allowed by law. There was no need for the government to replenish its coffers after elections and between elections; there were no gifts for voters. The PAP got people to vote for them again and again by providing jobs, building schools, hospitals, community centers, and most important of all, homes which they owned. Opposition parties also did not need money. They won positions because the electorate wanted opposition MPs to pressure the government for more

concessions (Lee 2011). This did not only save money for individual candidates and parties but also the nation and was used for other purposes.

## Corruption and Health

A healthy population is not only essential but also a prerequisite for economic growth and development. Healthy populations live longer, are more productive, and save more. Many complex factors influence a country's ability to provide quality health services for its people including, for instance, investments in transport infrastructure such as roads that easily improve access to health services, inflation targets that can constrain health spending, civil service reform that may create or limit opportunities to hiring more health workers, and corruption that siphons off public resources meant to help citizen access better health services. Corruption has been well documented as an impediment that can prevent access or development of a good healthcare system in a country especially those that are still developing. In the case of Uganda, the health sector in Uganda is rated the second most corrupt institution, and this has negatively affected the quality of health services provided. In 2005, the Global Fund for HIV/AIDS, malaria, and tuberculosis suspended all donations to Uganda when over 1.6 million US dollars of grants went missing. It is estimated that over two-thirds of drugs meant for free distribution in the public sector are lost due to theft, expired medicine is knowingly dispensed to patients, 68–77% of formal user charges are misappropriated or pocketed by workers, there is poor supervision and investment in medical services, and doctor to patient ratio is 1:15,000. As a result of all these deficiencies and corruption, 16 women die daily due to maternal complications or failure to access critical health services, infant mortality rate is 60.82 deaths/1,000 live births, and life expectancy at birth for males is 53.1 years (Gnocato et al. 2014), and almost all top-ranked government officials seek their treatment in foreign countries or private hospitals in the country that can be quite expensive, and the taxpayer foots the bill which over US$ 100 million per year which is a lot of money for a country like Uganda. The gaps and challenges are so huge and complex that fixing them requires not only training enough, recruitment and retaining health works, remunerating them adequately, building and equipping health facilities, and eliminating both petty and grand corruption, but also benchmarking best practices from countries like Singapore that got it right. Singapore realized and implemented a range of policies that support corruption-free healthcare system. For example, the Singaporean government believes that nobody in their country even a foreigner should go without healthcare and have a health savings plan called Medisave; the government sets prices for private insurance companies; healthcare costs for services and procedures are completely transparent; there are high healthcare subsidies for those with low incomes; and the government invests heavily in medical education. Because of this, the country enjoys one of the most successful healthcare systems in the world. Its citizens have low infant mortality rates, and its people have a life expectancy of up to 84 years.

## Corruption and Environment

In 1945, Sir Winston Churchill visited Uganda and called it the Pearl of Africa because of its beautiful and good environment. The country is very blessed with massive green vegetation, tropical forests, wetlands, and water sources including rivers and lakes. However, endemic corruption in the form embezzlement of money by public officials during implementation of environmental programs, petty and grand corruption when granting permits and natural resources exploitation have had severe consequences on the environment and environmental protection efforts. Since the early 1990s, Uganda has lost 26.4% of its forest cover, destroyed or encroached on fragile ecosystems like rivers, lakes, wetlands, and hillsides, and this has resulted in severe social-economic consequences including landslides, flooding, food insecurity, migration, conflicts, diseases, poverty, drought, loss of lives, and properties and climate change. Most Ugandans depend and will continue

to depend on the environment for their livelihoods both as a source of subsistence and as a basis for production, and its destruction puts human survival at risk (NEMA 2014). On the other hand, from the early 1960s, Singapore designed and executed deliberate environmental policies and strategies that aimed to protect environmental standards. Even when they were undergoing rapid industrialization and urbanization, Singapore still searched for some dramatic way to achieve first world standards in a third world region and distinguish themselves from other third world countries. They settled for a clean and green Singapore. They set up corruption-free committees who worked to transform Singapore into a tropical garden city by planting millions of trees, palms, and shrubs; kept down flies and mosquitoes; and cleaned up smelly drains, canals, and the Singapore River and Kallang Basin. Within no time there was a distinct spruceness of public spaces. This raised the morale of people and gave them pride in their surroundings and boosted tourism and investment (Lee 2011). After the 1990s, because of the increasing concerns over global environmental issues such as global warming and preservation of biodiversity coupled with a growing population that expected higher standards of living, Singapore undertook a major environmental policy review, and a new Green Plan was born. This plan was issued in 1992 which aimed to balance environmental and developmental needs. After the year 2000, the plan was reviewed, and new issues that had emerged such as transboundary air pollution and climate change caused by greenhouse gas emissions were incorporated. The outcome of this was another new plan (Singapore Green Plan (SGP) 2012) that aimed to move beyond from just being clean and green and toward attaining environmental sustainability. All these plans have been effectively implemented mainly because of clean leadership that keeps misuse of public resources at the very minimal. It is not just the good policies on paper that matter, because even Uganda has fantastic environmental policies and laws on paper. The problem has been implantation and specifically the misuse of entrusted authority or resources. That is what separates Uganda and Singapore.

## Corruption and Education

Education is a backbone for any country's development. Corruption in the education sector may take different manifestations, for instance, diverting money and other resources into non-existing or fictitious areas, for example, cheating of exams, ghost teachers, ghost schools, and ghost pupils which may affect the quality of the curriculum. In the case of Uganda and Singapore, their attitude and actions against corruption have had sharply contrasting outcomes on education. In Uganda, corruption in the education sector is both practiced directly at the government level and also other players in the sector such as owners and managers of institutions like schools, both government and private. It has been estimated that Uganda loses over UgShs 40 billion (US$ 11 millions) annually to ghost teachers, pupils, and schools. This is an equivalent of 360 classroom blocks or salary of 6,820 teachers a year. In addition, because of liberalization, many actors in Uganda are engaged in the education sector mainly aiming at profit making. Thus most of these schools admit inappropriately high student numbers, parents are made to pay more money, yet these institutions do not pay enough salaries to teachers which have resulted into moonlighting, teacher absenteeism, and low-quality teaching leading to poor education achievement, high dropout rate, and high unemployment among the youth that go through such a system (NDPII 2015). On the other hand, the Singaporean government established high-quality education through transparent and accountable use of its resources, providing high-quality infrastructures, better rewards for teachers, and equipment geared toward vocational and science training. They selected their cream students from each year graduates and sent them to the top universities in advanced countries. The government also put in place high-quality vocational schools to prepare less academically inclined students with skills to earn a better living in vocational careers, gave scholarships to bright poor children to allow them realize their full potential, prevent building up of a permanent underclass, and allow an upward social mobility. Disadvantaged pupils who were unable to pass the basic primary school

leaving examination received intensive support including hands-on vocational training, life skills, and counseling to those with emotional difficulties, and all this contributed to social cohesion in Singapore's multiethnic society (Lee 2011).

## Conclusion

This entry concludes that corruption has a very significant impact on development in country. It is important for countries to learn from one another especially to those that have achieved excellency even in the face of serious difficulty, and Singapore is a model for many on the African continent especially Uganda.

# Corruption and International Aid

Adam Salifu[1] and Abdul-Gafaru Abdulai[2]
[1]University of Professional Studies, Accra, Ghana
[2]Department of Public Administration, University of Ghana Business School, Accra, Ghana

## Synonyms

Aid effectiveness; Development aid; Foreign aid; Official development assistance; Overseas aid; Poor governance

## Definition

**Corruption:** It is the misuse of public powers, office, and authority for private gain through bribery, extortion, influence, peddling, nepotism, fraud, speed money, or embezzlement.

**International Aid:** It is the transfer of any form of needed assistance such as financial capital, goods, or services from one country or international organization to another country for the benefit of its population. International aid mostly targets poverty reduction, the promotion of public welfare, or economic development.

## Introduction

The relationship between corruption and international aid has received considerable attention in the last couple of decades. Despite concerns that development assistance is often rarely put into effective use in highly corrupt countries, the period 1960–2010 witnessed a steady increase in development aid. The Organisation for Economic Cooperation and Development (OECD) estimated that leading donor countries gave about US$126 billion in development aid to lower-income countries in the year 2010 alone (OECD n.d.-a). More recent evidence provided by the World Bank suggests that in the year 2015, net official development assistance was amounted to approximately US$152.5 billion (World Bank n.d.). Among the leading countries that provide aid to developing countries are the United States of America, United Kingdom, Germany, Japan, France, Sweden, Norway, The Netherlands, Canada, and Australia. Afghanistan, Vietnam, Syria, Israel, Pakistan, Ethiopia, Kenya, Sudan, and Jordan are among the main recipient countries of aid.

There is growing awareness about the role of high levels of corruption in undermining the effectiveness of international aid (Fletcher and Herrmann 2012). There is broad-based consensus among donors, aid agencies, and policy makers that wide spread corruption undermines aid effectiveness in several ways. In particular, corruption delays and distorts social and economic development processes, as public resources are diverted away from the provision of basic essential services for private gains.

Today, while most donor countries have spoken against corruption, they still channel aid to countries that are perceived to be corrupt. However, a majority of donor countries are not able to meet the target set by the UN General Assembly (UNGA) regarding the levels of aid required to help in the elimination of extreme global poverty. In 1970, the UNGA proposed that developed economies should aim to contribute the equivalent of at least 0.7% of their gross national income to international aid and development as a way of demonstrating sufficient commitment to tackling extreme poverty across the globe. With the notable exceptions of Luxembourg, Norway, and Sweden, most developed countries have thus far failed to allocate up to 0.7% of their national income in the form of development aid to poorer countries.

This entry discusses the problem of corruption within the field of international aid and development. It begins by explaining the concepts of corruption and international aid. The entry then discusses the risk of corruption in international aid and then explores the different tools and techniques that have been used to measure corruption. This is followed by an examination of the effects of corruption on international aid and a discussion of the efforts that have so far been made in the fight against corruption within the context of international development. The last section concludes the entry.

## Explaining Corruption and International Aid

Corruption is a complex human practice that has been in existence since the creation of mankind. While corruption has a long history, not only has it become pervasive, but has also taken different forms in recent years. In spite of the long history of corruption, there is a lack of consensus on its definition. The most widely used is the World Bank's definition of corruption as the abuse of public office for private gain. While this definition seems to confine the problem corruption within the public sector, it is important to emphasize that corruption can take a rater larger scale that involves the private sector and civil society organizations. The UNDP also provides one of the most common international definitions of corruption: the misuse of public powers, office, and authority for private gain through bribery, extortion, influence, peddling, nepotism, fraud, speed money, or embezzlement. Much of the literature on corruption either explicitly or implicitly sees corruption as a sign of social decay and instability. Indeed, most dictionary definitions of corruption emphasize dishonesty, perversion, and depravity which implies corruption takes place when something wholly or good – which could be public office or the administration of public resources according to established rules and laws – is being distorted, violated, or tainted. It is also important to note that corruption occurs in all countries across the globe, including both developed or developing countries, democratic or autocratic countries, open capitalist economies or state planned economies, and low or high income countries. Undoubtedly, the level of corruption varies from one location to the other with developing, autocratic, and low income countries perceived to have higher levels of corruption.

International aid on the other hand has often been used interchangeably with concepts such as development aid, development assistance, overseas aid, and foreign aid (Fletcher and Herrmann 2012). International aid seems to have emerged only after the World War II. This was the time the United States used resources from aid to assist in the rebuilding of Europe. During the Cold War, particularly between 1960s and 1980s, foreign aid was frequently utilized as an instrument of courting allies by the two super powers at the time: the Eastern Bloc, comprising the Soviet Union and its allies, and the Western Bloc, comprising the United State of America and its NATO allies. However, with the collapse of the Soviet Union and the resultant end of the Cold War, the focus of international aid shifted more towards the reduction of global poverty, although with some conditionalities still attached to the aid. Today, most international aid comes with certain requirements, which often relate to political, economic, social, and ideological reforms. While some donors may attach change of regime or policy to aid, others attach religious preferences.

One can identify two broad forms of international aid: humanitarian (or emergency) and development aid. While humanitarian aid is aimed at alleviating the suffering of people in the short-tem, development aid is intended to alleviate poverty or ensure long-term socio-economic and political development. Humanitarian aid is mostly used for short-term emergency relief and often provided during natural disasters or violent conflicts. Development aid on the other hand is often provided on relatively long-term basis with the primary aim of promoting sustainable economic growth, political, environmental, and social development as well as reducing poverty in developing countries.

At the heart of international aid are donors, who make decisions as to whether to support national budgets or specific projects within recipient countries (Amen and Knack 2015). With project aid, donors support specific projects, such as building a health center or constructing irrigation systems. In the case of budget support, the aid flows directly to the recipient country's budget or national treasury. This implies that project aid allows donors to have control over the activities on which their aid is being spent, while budget support can be disbursed according to the recipient country's own allocation formula or system. A related type of aid is sector budget support, also sometimes referred to us program-based assistance. The main different between budget support and sector budget support is that while the former is directed to the national budget, the latter is limited to specific sector(s) within the national budget such as agriculture, energy, education, health, water, and sanitation. Many donors that provide sector budget support perceive it as having a greater potential of increasing the recipient nations' long-term planning and ownership abilities as well as reducing the operational and transaction cost of donors.

Similarly, there are two main categories of donors: bilateral and multilateral. Donors face growing demands to justify the allocation choice between bilateral and multilateral aid channels. Bilateral donors are government agencies that give aid directly to recipient countries on a state-to-state basis or state-to-NGO/Civil Society partnership. This means that one country will give aid directly to another, usually through its national development agency. Some bilateral donor agencies sometimes channel aid through local and international NGOs such as Care International, ActionAid, and Oxfam. There are about 28 bilateral donor members within the OECD Development Assistance Committee (DAC) alone (OECD n.d.-c), and a growing group of non-DAC donors consists of at least 28 states (Gulrajani 2016). Some bilateral donor agencies include the United Kingdom's Department for International Development (DFID), the United States of America's Agency for International Development (USAID), Australian Agency for International Development (AUSAID), Germany's GIZ, and the Norwegian Agency for International Development Cooperation (NORAD), among others.

Multilateral donors on the other hand often give aid through intergovernmental organizations. Here, donor countries will first provide the aid to international agencies or organizations who in turn will disburse to developing countries (Amen and Knack 2015). The multilateral donor system involves over 210 major organizations and funds, as well as various smaller trust funds (OECD n.d.-a). Key multilateral donors around the world include the World Bank, UN agencies (such as UN World Food Programme and UN Development Programme), African Development Bank, the European Commission, and Asian Development Bank. The following section discusses the risk of corruption in international aid.

## The Risk of Corruption in International Aid

As noted earlier, corruption is more pervasive in some societies than others. Several factors determine the level of corruption in society with the key ones being economic inequality and weak institutions in government and civil society. For purposes of this entry, the risk of corruption in international aid is examined here according to the instruments through which aid is disbursed (that is whether budget support or project aid) and the

type of aid being provided (that is whether humanitarian or development aid) (Fletcher and Herrmann 2012).

The two main aid instruments – budget support and project aid – that donors use to provide aid are vulnerable to corruption if appropriate steps are not taken. With regards to project aid, one of the greatest risks is the likelihood for project funds to leak. The effect of this is that the project will not achieve its desired results and impact. The risk of corruption, among other things, will also depend largely on the sector in which the project is being implemented, the size of the project, type, and number of stakeholders involved in the project and the nature of internal processes put in place to implement the project (Fritz and Kolstad 2008). In countries with high levels of corruption, the risk of corruption will be present throughout the project cycle – the design stage, the implementation phase, as well as the monitoring and evaluation phases. First, the design stage of a project involves decisions about the scale, form, and location of the project as well as procurements. Here, corruption can lead to decisions that favor specific groups, companies, or contractors with the objective of receiving kickbacks. In such contexts, corruption could take the form of bid rigging, resulting in the appointment of incompetent contractors and price inflations. Second, at the implementation stage, there is a high risk of misappropriating the actual aid such that aid deliverables (e.g., agricultural inputs) would end up in the hands of a few privileged elites. It is also at the implementation phase of projects that public officials may demand bribes before they provide services such as granting permits and releasing funds to contractors. The contractors on the other hand may request to pay bribes and kickbacks to public officials or local aid workers to enable the latter get away with substandard and unfinished work. Finally, during the monitoring and evaluation phase, bribes and distortion of financial data and reports can take place to exaggerate or hide fact from donors (Fletcher and Herrmann 2012). For instance, different stakeholders at the local level have the tendency to forge bills, financial reports, and payroll lists.

The above discussion on project aid, however, does not suggest that corruption takes place only in the recipient countries. There are also leakages of international aid within the countries of origin through corrupt practices (Amsden 2009). This implies that part of the international aid could be spent or misspent within donor countries before it is sent to the recipient countries. Corruption within the donor countries could be as a result of involving ruling political leaders or even business men and women as agents of the donor countries during the implementation stage of projects (Amsden 2009). Similarly, at the implementation stage of projects, several actors from the donor countries such consultants, staffers, and contractors end up spending a substantial share of the international aid using corrupt means for services they render. It is therefore not surprising there is some degree of perceived corruption in countries that are major donors of international aid. According to Transparency International's 2016 Corruption Index for example, the United States of America, Japan, and France – who are major donors of international aid – were not adjudged the cleanest countries in terms of perceived corruption, but were ranked as the 18th, 20th and 23rd cleanest countries, respectively.

The risk of corruption is also high with direct budget support particularly in recipient countries that are less democratic, and this partly explains why some bilateral donors such as Japan and the United States of America prefer to have greater control over their aid by supporting specific activities with the recipient countries (Fritz and Kolstad 2008). The main risk with budget support is that utilization of aid becomes less transparent largely due to weak budget and audit reporting. Organizations such as the Transparency International have noted that direct budget support is more prone to suspension by donors, as compared to project aid especially if recipient countries have weak administration, governance, and budgeting systems (Transparency International 2007). Donors who do not want to be directly labeled as supporters of corrupt leadership also avoid direct budget support given the high risk involved in this form of budget support.

Concerning humanitarian aid (aid in the form food aid, shelter, protection, refugees and internally displaced persons, health care, water and sanitation), there are at least two factors that contribute to the risk of corruption. These are the characteristics of humanitarian relief system and the internal processes inherent the aid. Ewins et al. (2006) and his colleagues outlined three main characteristics of humanitarian aid that creates the avenues for corruption. The first is the short response time needed during human emergencies or crisis, which often does not provide room for undertaking anticorruption measures. The second characteristic concerns the asymmetrical power relationship among the donors, aid agencies or workers, and the beneficiaries. That is, the transfer of resources is one-sided, thereby undermining transparency and accountability. Finally, humanitarian aid is often characterized by the proliferation of different organizations, huge coordination challenges, and huge quantities of funding, thereby making the risk of corruption high.

The internal process and the conditions inherent in humanitarian aid also make it more vulnerable to corruption. Embezzlement, for instance, can take place at almost every stage of the humanitarian aid cycle. Corrupt officials in procuring or purchasing relief items can either inflate their prices or deliver poor quality items, especially in contexts where kickbacks are involved. Similarly, some officials may sell the relief items for their own benefit or even decide to distribute the relief items to persons not targeted by the aid program in return for bribes, among others. Transparency International reminds us that humanitarian aid often gets distributed under very challenging circumstances such as weakened state capacity and nonexisting or destroyed essential infrastructure, which often result in the breakdown of law that then provides incentives for corruption to thrive (Transparency International 2007).

## Measuring Corruption

How is corruption measured? The measurement of corruption is highly controversial although the need to measure corruption is important for several reasons. First, one can best tackle corruption if the type and the extent to which corruption is widespread are known. Second, knowing the level of corruption provides anticorruption advocates and policy makers the opportunity to assess the effectiveness of anticorruption measures. At the same time, it can awaken governments and their partners towards effective anticorruption reforms if the seriousness of corruption is highlighted. Third and more importantly for recipient countries, some donors use the level of corruption as a criterion in the provision of aid. For instance, the government of the United States America through its Millennium Challenge Account initiative has made good governance and corruption key issues in determining how development aid should is distributed.

In spite of the relevance of measuring corruption, its measurement has received some criticism. The most commonly cited challenges regarding the measurement of corruption include the lack of consensus on the definition of corruption, the hidden nature of corruption, as well as the reliance on perception-based measures and disagreements over which types of data can be used reliably as indicators of corruption.

A significant number of techniques and tools have been developed to measure corruption since the 1990s. Following the launch of the United Nation's Human Development Index in 1990, there has been a proliferation of various cross-country indices to rank countries in order to provide insights about the relative ranking or standings of countries around the world. The assessments of corruption were part of some the indices. Chief among those indices that sought to assess the level of corruption were the Transparency International Corruption Perception Index (CPI) and the World Bank's Worldwide Governance Indicators (WGI). While the CPI started 2 years (1994) before that WGI (1996), they both depend largely on a similar methodological approach of using existing cross-national data sources, such as public opinion polls, expert ratings, and surveys among business people, to generate a composite indicator of the extent of perceived corruption in a country. The WGI currently aggregates governance indicators for

215 countries and territories with the objective of offering a multidimensional view of governance that allows comparison of perceived levels of corruption to other areas of governance such as the level of ordinary citizens' participation in public affairs among countries.

The most widely used cross-national measure of corruption is the CPI, computed annually since 1995. The CPI is published by Transparency International, a Berlin-based NGO and one of the most influential anticorruption watchdogs around the world. The CPI is based on elite perceptions of corruption in a wide range of countries (176 countries were included in the 2016 CPI), employing a wide range of sources. It aggregates data from the different sources that provide perceptions of business people and country experts of the level of corruption in the public sector on scale of 0 to 100 where zero means highly corrupt and 100 mean very clean country. The global average CPI score in 2016 was 43 out of 100. Any score below 50 means the government is failing to address the country's endemic public sector corruption. Figure 1 shows the Transparency International's 2016 CPI around the world. Clearly, it shows high levels of perceived corruption in the developing world including most of South America, Asia, and Africa. As noted earlier, it is these developing regions that receive most international aid.

Transparency International also has Global Corruption Barometer which is based on public opinion surveys and implemented in approximately 80 countries on bi-annual basis. It mainly examines the views and experiences of citizens with regard to a range of corruption issues, from satisfaction with government efforts to fight corruption, the willingness to report corruption

**Corruption and International Aid, Fig. 1** Corruption perceptions index 2016

within countries, and the frequency of bribery as experienced across a range of public services.

Another measure of corruption is the International Crime Victim Survey (ICVS), which involved more than 70 countries and coordinated by the Dutch Ministry of Justice in conjunction with the United Nations Inter-Regional Crime and Justice Research Institute (UNICRI). The ICVS is implemented at nonregular intervals, and there have been six rounds of surveys so far, with the last round conducted in 2010. Other important tools that have corruption assessment components include the Global Integrity Index, the Open Budget Index, Public Expenditure and Financial Accountability Framework (PEFA), and the Promoting Revenue Transparency Companies Report There are also wide variety of country-specific techniques and tools that have been developed to provide comprehensive and nuanced assessment of a corruption in specific context.

## The Effects of Corruption on International Aid and Development

This entry has already discussed the risk of corruption in aid development. Here, the entry explores the effects of corruption on international aid. While corruption is a huge problem all over the world, it is perhaps one of the most fundamental obstacles to development in developing countries. As noted already, there is a general consensus that high level of corruption in developing countries can seriously undermine the intended results of international aid. This may not only undermine economic growth but also may lead to human right violations, political instability, erosion of public confidence in institutions, and the exacerbation of poverty (Fletcher and Herrmann 2012). Corruption has the potential of deterring foreign investors.

As a former president of the World Bank, Paul Wolfowitz (2005–2007) once remarked, "The fight against corruption is a part of the fight against poverty, not just because corruption is wrong and bad but because it really retards economic development." Indeed, in 2005 when Paul Wolfowitz assumed office, the World Bank suspended loan disbursements to several developing countries on grounds of corruption. It must however be emphasized that there is no consensus as to whether highly corrupt countries should continue to receive aid or not. Similarly, other have noted that there is no point in helping poor countries with high level of corruption as their leaders are likely to waste or divert the money. For instance, when political leaders and their business allies divert aid money to their offshore bank accounts, poor nations become poorer. Hawley (2000) estimates that approximately $9 billion out of a total of $30 billion of World Bank loans to Indonesia during the General Suharto regime from 1967 to 1998 were diverted from the country's development budget funds.

With reference to humanitarian aid for natural disasters or violent conflicts, Ewins et al. (2006) and colleagues have noted that the cost of corruption can effectively result in loss lives, property, and profits as well as lower economic growth. Corruption could result in the diversion relief items or supplies away from the affected communities or even distributing them in an inequitable fashion. As a consequence, the needs of the intended beneficiaries will not be met.

## Fighting Corruption in International Development

Fighting corruption in general is not cheap. Not until the 1990s, there was no systematic effort on the part of both donors and recipients to fight corruption in the field of international development. Many donors including the World Bank largely ignored the fight against corruption in international aid mainly due to political sensitivities and the fear of being accused of interfering with the domestic affairs of recipient countries. Prior to 1995, the World Bank primarily viewed corruption as an issue of politics and stayed largely away from the fight against it. Some bilateral donors were also reluctant to address the issue of corruption in their aid projects for diplomatic reasons.

The World Bank, a major multilateral donor, only started to participate in international efforts

to fight corruption only after Jame D. Wolfensohn became its president in 1995. Following the World Bank, many other donors took corruption more seriously and embarked on several initiatives to improve the mechanisms through which aid is delivered and utilized. One such global effort was the Paris Declaration on Aid effective in 2005 – an action-oriented roadmap that seeks to ensure that both donors and recipients hold each other accountable to improve the quality of international aid and its impact on development (OECD n.d.-b). Many donors like the World Bank also started to fight corruption by redesigning their projects, raising awareness about corruption in recipient countries as well as advocating and supporting reforms in government institutions, particularly in the areas of financial management and public administration. According to Transparency International, public financial management is critical in the fight against corruption in developing countries. Strong financial and administrative managements are even more important in tackling corruption in humanitarian aid, as this will ensure the tracking of high-value relief supplies.

Regarding the issue of raising the awareness about corruption, aid beneficiaries within recipient countries should be involved in decision making and management of aid. In particular, they should have a clear understanding of the type of aid they are entitled to, the targeting and distribution criteria and the intended impact it will have on the beneficiaries. This means that the promotion of transparency and accountability is important for the success of anticorruption strategies. Some donors like the World Bank have also taken steps to improve their internal anticorruption strategies by training their staff in corruption awareness and have put in place mechanisms for reporting and investigating allegations of corruption. For instance, the World Bank has set up the Department of Institutional Integrity and Sanctions Committee to investigate allegations of corruption in the execution of contracts. Similarly, donors have started introducing more participatory processes by including the media and active civil society organizations in recipient countries to increase awareness about corruption and empower all relevant stakeholders. The media, for example, can expose systemic and organized corruption by making public information on the corrupt system and increasing pressure on governments to take action.

In their efforts to combat corruption in international development, five international financial institutions (the World Bank, the Asian Development, the African Development Bank, the European Investment Bank, and the European Bank for Reconstruction and Development) adopted a more coordinated approach in 2006 by setting up the International Financial Institution (IFI) Anti-Corruption Task Force, which introduced a uniform framework to fight fraud and corruption. With the adoption of the "IFI Anticorruption Task Force Uniform Framework," the five participating banks agreed on a standardized definition of corruption in order to fight it. The important point to note here is that better coordination among donors can help in the fight against corruption, especially if participation institutions adopt consistent policies and procedures and engage in the sharing of best practices among themselves.

Some donors have also tied aid to demonstrable commitment towards fighting corruption. Today, almost all donors have incorporated anticorruption clauses into their agreements in aid projects and sanctions are applied if corrupt acts are detected. Some donors have also introduced measures such as confidential hotlines (e.g., the World Bank), whistleblower protection, external auditors, ombudspersons, and voluntary disclosure programs to fight corruption (Kramer 2007). The conditioning of international aid on appreciable level of reduction in corruption is also a strategy used. In addition to reducing corruption, some donors have linked aid to specific conditionalities such as respect for human rights or democratic freedoms. In view of the above effort, we should note that while tax payers in donor countries find it challenging to scrutinize the delivery of aid due to the multilayered aid system, aid beneficiaries in recipient countries find it difficult to put their governments accountable because they are often poor and marginalized groups.

## Conclusion

This entry discusses the problem of corruption in the field of international aid and examines the risk of corruption in both humanitarian and development aid. While corruption is pervasive in developing countries – the countries that need more international aid to develop – cut of international aid because of practices by corrupt officials will be like punishing such countries twice over. Rather, the entry outlined a significant number of strategies that both aid donors and beneficiaries should adopt to minimize the level of corruption in the provision and use of international aid. These observations highlight the relevance of effective coordination among donors in their fight against corruption in international development. In particular, it is crucial that donors adopt consistent policies and procedures and make greater efforts in sharing successful anticorruption experiences across the countries in which they work. At the same time, international aid can serve as a powerful socio-economic and political tool for donor countries to coerce or bribe recipient countries to take actions or undertake activities that are in line with their interests.

# Corruption in Post-Soviet Uzbekistan

Rustamjon Urinboyev
Aleksanteri Institute, University of Helsinki, Helsinki, Finland
Sociology of Law Department, Faculty of Social Sciences, Lund University, Lund, Sweden

## Synonyms

Informal governance in Uzbekistan; Corruption in Central Asia

## Definition

The international legal definition of corruption refers here to the one presented by Transparency International: "The abuse of entrusted power for private gain" (TI 2016).

The term "mahalla," derived from the Arabic mahali ("local"), is formally used in Uzbekistan to mean neighborhood, local community, or state administrative unit. Today, there are some 12,000 mahallas in Uzbekistan, each of which consists of anything between 150 and 1,500 households. In Uzbekistan, local people also use the word to describe community-based, informal economic practices. In this sense, mahalla denotes the means whereby people obtain access to public goods, services, and social protection while bypassing the state.

## Introduction

The collapse of the Soviet Union in 1991 led to the emergence of 15 independent states, 5 of which were in Central Asian. The Western world proclaimed the collapse as a victory for freedom and a final triumph of democracy over communism. There was a widespread assumption, both inside and outside the post-Soviet space, that the introduction of Western-style political institutions and legal systems would promote good governance and rule of law in post-Soviet societies. However, an analysis of the academic literature and policy reports on these societies indicates that social inequality has apparently increased in the post-Soviet period. This has resulted in a growing concentration of wealth in the hands of kleptocratic state officials and business elites who are well connected to the higher echelons of government. It has also contributed to growing poverty among the population in general (cf., Dillinger 2007; Habibov 2011; Hohmann et al. 2014; Humphrey 2002; Luong 2004).

Corruption is one of the main problems in this respect. There have been extensive discussions in academic and policy circles of why corruption remains a persistent and pervasive phenomenon in post-Soviet societies (e.g., Karklins 2002; Knack 2006; Polese 2008; Rivkin-Fish 2005; Urinboyev and Svensson 2013; Wanner 2005; Werner 2000). This chapter presents a further study in this direction and focuses on the case of post-Soviet Uzbekistan, about which, due to the authoritarian nature of the political regime, only a limited amount of information and data are available. Uzbekistan is also an internationally significant (yet under-researched) case given its position as one of the most corrupt countries in the world according to the Transparency International's (TI) Corruption Perceptions Index (TI 2016). The purpose of this chapter is thus to explore and delineate the factors and processes that explain the emergence and ubiquity of corruption in Uzbekistan, to analyze the current anti-corruption situation and efforts in the country, and then to suggest areas of governance reform as well as avenues for future research.

## Corruption and Informal Governance in Uzbekistan: The Karimov Era

Uzbekistan, like other newly independent post-Soviet states, was faced with the complex task of building a new nation-state. Coming on the heels of the global (Western) good governance discourses, the political leadership of Uzbekistan made all sorts of bold claims about their strong commitment to the ideals of democracy, market economy, human rights and the rule of law, as well as their intention to dismantle the Soviet-style governance (cf., Perlman and Gleason 2007). At the same time, Uzbek authorities made it clear that its governance system, while adhering to global standards, would also deploy Uzbekistan's ancient traditions, rich Islamic heritage and centuries-old administrative traditions in the nation-building project (Karimov 1993). Many international organizations, such as the World Bank, IMF, and UNDP, promptly geared their development programs to the Uzbek authorities' reform agenda, financing and initiating innumerable good governance, market economy, and human rights projects.

However, the complex and multidimensional nature of the political stability challenges that Uzbekistan faced in the 1990s, for different reasons, made the government skeptical towards real democratization and market reforms. The need to prioritize political stability over reforms was justified by the unstable political situation in Central

Asia during the 1990s. This included ethnic clashes between the Uzbeks and the Turks in 1989, ethnic conflicts between the Uzbek and Kyrgyz people in southern Kyrgyzstan in 1990, and the civil war in neighboring Tajikistan, 1992–1997 (Fane 1996; Megoran 2017; Warikoo and Norbu 1992). Consequently, the Uzbek authorities made it clear from the beginning that the "big bang" or shock therapy approach to transition would not be suitable for Uzbekistan (Ruziev et al. 2007). Instead, Uzbekistan adopted a gradualist approach, maintaining Soviet-era welfare policies and centralized control over the priority sectors of the economy (Spoor 1995). Thus, preserving the stability of the economy and of the social and political order has since become an overarching rationale for rejecting the economic and political reforms recommended by international institutions and for developing a strict border regime (Fumagalli 2007).

Notably, during the early years of transition, Uzbekistan achieved small but positive and persistent economic growth due to its favorable economic conditions such as the dominance of agricultural production, the low level of initial industrialization, and the rich natural resource base (Zettelmeyer 1998). Uzbekistan suffered less from the transition depression than its neighboring Central Asian states and was among the first to report positive output growth for the first time in 1996 (Spechler 2002). The cumulative decline in GDP between 1989 and 1996 was the lowest in Uzbekistan among all former Soviet republics. Uzbekistan did fairly well in terms of providing a social safety net, alleviating poverty and limiting spending cuts in education and health care, especially in the mid-1990s (Johnson 2007; Pomfret 2000). Soviet-style centralized economic management and strong social protection measures seemed to be successful in the transition period, as they prevented large output decline and served to maintain a reasonable standard of living. The agricultural sector prevented the increase of unemployment by providing job opportunities in rural areas. In this respect, during the early years of transition, Uzbekistan maintained Soviet-era welfare policies and centralized control over the priority sectors of the economy since these policies had considerably contributed to political stability and security.

However, the gradual reform strategy appeared to be a short-term remedy. The gradualist approach to transition did indeed contribute to the prevention of a sharp output loss and the consequential rise in unemployment and social unrest during the early years of transition. In spite of this, by 2000, it became evident that the economy was simply stagnating (Kandiyoti 2007). This was largely due to the government's heavy involvement in maintaining the practice of centralized management over the key sectors of the economy, which created significant administrative barriers and a high tax burden, thereby causing high transaction costs for national business and the prevalence of an informal economy (Ergashev et al. 2006). As Kandiyoti (2007) maintains, the partial market reforms that the government of Uzbekistan implemented in pursuit of stability paradoxically resulted in inefficient resource allocation and widespread corruption that led to a significant retrenchment of the welfare state. The centralized management methods negatively affected the agricultural sector in particular, which was evidenced by the government actively intervening in the cotton sector by redistributing income from agriculture. This was done in order to develop industries that produced import substitutes. Since agriculture has traditionally been the main shock-absorbing structure in rural areas, the reallocation of resources from agriculture to industry negatively affected the living standard of the rural population (Ilkhamov 2004; World Bank 1999). At the same time, the government took a series of severe measures to liquidate, or formalize, informal economic activities (bazaars and petty cross-border trade), which provided alternative means of survival for hundreds of thousands of people (Ilkhamov 2013). Although the Uzbek economy is said to have been experiencing above-trend rates of growth (7–8%) since 2004 (IMF 2012), these indicators hardly reflect the everyday realities in Uzbekistan in which many people, especially in rural areas, are compelled to secure their livelihood needs through alternative sources of income and a social safety net (Rasanayagam 2011; Urinboyev 2013).

These developments led to the emergence of informal governance structures in Uzbekistan (Urinboyev et al. 2018). As the state retreated from its social welfare obligations and failed to provide formal income-earning opportunities, citizens reacted to these changes by devising informal coping strategies (Urinboyev and Svensson 2017). Many commentators now argue that Uzbekistan has made little progress in promoting the rule of law and good governance, and that corruption has become a part and parcel of everyday life (Ilkhamov 2017; Kandiyoti 2007; Lewis 2016; Markowitz 2008; Rasanayagam 2011; Trevisani 2007; Urinboyev and Svensson 2013). According to the *Corruption Perceptions Index*, released annually by Transparency International, Uzbekistan has regularly been ranked among the most corrupt countries in the world (TI 2016). The "control of corruption" indicator of the *World Bank Governance Studies* also shows an extremely high level of corruption in Uzbekistan (World Bank 2014). Although Uzbekistan acceded to the UN Convention against Corruption in 2008 and recently adopted an Anti-Corruption Law on January 4, 2017, no significant success in reducing corruption has been apparent. The latest policy report, *Tackling Corruption in Uzbekistan*, commissioned by the Open Society Foundations Eurasia Program shows that the Uzbek authorities' recent anticorruption drives largely reflect political maneuverings in the elite, rather than a genuine attempt to combat corruption (Lewis 2016).

Academically, there is a growing body of literature on Uzbekistan's governance trajectories. Much of the scholarly literature, especially anthropological accounts, demonstrates that corruption permeates all levels of the state and society, from daily interactions between ordinary citizens and low-level state officials to kleptocratic practices involving high-level state officials (e.g., Abramson 2000; Ilkhamov 2017; Kandiyoti 2007; Markowitz 2008; Perlman and Gleason 2007; Rasanayagam 2011; Taksanov 2000; Wegerich 2006). Much of this research concentrates on macrolevel topics and state-centered approaches that focus on: authoritarianism and the persistence of a Soviet-style administrative culture, predatory elites, a dysfunctional public administration system, illiberal economic policies, clan politics, post-Soviet agricultural reforms, corrupt law-enforcement structures, and inadequate ways of dealing with corruption on the part of state authorities. These authors argue that the struggles among various state actors to gain control over scarce resources have resulted in an inefficient resource allocation and contradictory state policies, thereby making corruption and bribery part of the governance mode in Uzbekistan. At the same time, these studies also claim that there is a need to distinguish between the informal practices of kleptocratic elites, which have nothing to do with "survival," and the informal coping strategies of ordinary citizens and low-level officials. Another body of scholarly works suggests that it is the penetration of clans and regional patronage networks into official structures that depletes the state's organizational powers and causes corruption in state institutions (Collins 2003; Ilkhamov 2007; Kubicek 1998; Luong 2004; Pashkun 2003). Others have explained the ubiquity of corruption in Uzbekistan as an outcome of its communist past (Ergashev et al. 2006; Gleason 1995; Staples 1993).

The above studies share two common features in terms of analyzing corruption in Uzbekistan. First, they explain the ubiquity of corruption with reference to the authoritarian nature of the political regime. This idea is consistent with the mainstream corruption literature in which a strong state is seen as the key driver of widespread corruption, especially when it tends to function as a totalitarian and monopolizing agent (e.g., Heidenheimer et al. 1989; Sun 2004; Varese 2001). Second, they reflect the "corruption of the weak" approach, in which informal or illegal practices are seen as a survival strategy that provides alternative means for ordinary residents and low-level state officials to secure their basic needs (De Sardan 1999; Ledeneva 2013; Polese 2008; Sneath 2002). While recognizing the importance of "strong state" explanations, it should be noted that they are not sufficient, and run the risk of aggrandizing the role of the state as being the prime mover of widespread corruption, as if it alone shapes

the basic patterns of economic life and determines the parameters of daily social relations. Moreover, survival strategy explanations cannot satisfactorily explain the nonmonetary and affective dimensions of informal transactions. These needs to be considered when studying corruption in traditional, collectivist societies like Uzbekistan where society is organized around kinship networks. Of course, economic motivations play a major role in informal transactions, but the fashions and rituals in which they take place show a high degree of embeddedness in social norms, traditions, moral codes, and affective logics. Hence, to gain a more nuanced understanding of the nature, causes and forms of corruption in Uzbekistan, there is also a need to focus on the everyday life and social interactions on a microlevel.

## The Basic Social Fabric of Uzbek Society

Having been under the Soviet planning system for more than 70 years, Uzbekistan embodies a peculiar blend of traditionalism and modernity. As Pashkun (2003) describes, the ruling elite is quite Westernized (Russified), while a large portion of society, especially the rural inhabitants who account for more than 60% of the population, are still strongly devoted to traditions, collectivism, family, kinship, and religious values (Pashkun 2003; Poliakov 1992). This implies that the behavioral imperatives, expectations, and social sanctions emanating from these traditional structures largely shape the basic parameters of everyday life and social relations in Uzbek society (Urinboyev and Svensson 2017). These processes become particularly evident when observing the social interactions in the realm of the mahalla (neighborhood community), a primary social institution that deserves special attention when examining corruption in Uzbekistan.

As the state in contemporary Uzbekistan is no longer able to provide jobs and social services, Uzbek people frequently rely on social safety nets and mutual aid practices within their mahalla and kinship networks. These practices serve as a shock-absorbing institution for many people, enabling them to secure their basic needs and gain access to public goods, services and social protection unavailable from the state. Typically, such mahalla-based mutual aid practices include monetary and labor exchanges, rotating savings and credit initiatives, noncompensated labor during life-cycle rituals, housing construction and contributions to charity. Hence, few wedding feasts, funerals, irrigation building, road asphalting, medical operations or house constructions take place in the life of villagers without family, kinship or mahalla support. For example, according to Uzbek social norms, people are expected to give a fixed amount of money to the host when they attend wedding feasts. People actively engage in such mutual aid activities, since these practices enable them to not only meet their livelihood needs but also provide space for participation in everyday life and social interactions.

These mutual aid practices create strong moral and affective bonds within the realm of mahalla life. Uzbek people regularly attend most of the socializing events together and have a relationship of mutual dependence. The fact that people meet one another on a daily basis and regularly interact at social events acts as a guarantee that mahalla pressure and sanctions can be applied to an individual or his family who are not acting fairly, or are not helping a neighbor or mahalla member. Consequently, there is a high probability that people will help their family, kin, or mahalla members when they need assistance. Relying on kinship and mahalla connections is also a way to make up for the "absent state". Hence, the give-and-take rituals constitute an integral part of everyday interactions in Uzbek society.

While the aforementioned mutual aid practices produce social solidarity and reinforce the basic social fabric of Uzbek society, they may also contribute to the emergence of the initial elements of corruption. According to the informal mahalla norms, the individual is expected to share his or her economic resources and political influence with the mahalla (family, kinship group, neighbors). These norms shape the behavior of individuals when they engage in public administration or wield some political or economic resources. In

this regard, the state officials have little room for individual choice and often find themselves torn between loyalty to their family, kin, and mahalla and honesty at work. Thus, upholding respect and loyalty for family, kin, and mahalla networks often comes at the expense of using/abusing one's public office, thereby leading to an omnipresence of informal and illegal practices in state institutions (cf. Urinboyev and Svensson 2013, 2017). In this way, mahalla-based social practices undermine the rule of law and good governance initiatives by promoting alternative versions of how people should behave. Perlman and Gleason also share this perspective, noting that the "Asian path is different from other competing approaches in that it is synthetic-binding together the interests of the state, the society, the family, and the individual" (2007, p. 1333). Hence, the behavioral instructions promoted by the mahalla influence social behavior and everyday life more effectively than the laws of the state. Although these social practices can be interpreted as an instance of "corruption" according to the international legal definitions thereof, they are accepted within mahalla norms and traditions as a legitimate practice – regardless of whether they are legal or illegal.

## Governance and Anticorruption Policies in the Post-Karimov Period

The account presented in this entry mainly reflects the state of everyday life under President Islam Karimov (1991–2016) whose quarter-century rule in Uzbekistan had left rampant corruption and a stagnant economy that resulted in massive labor migration to Russia and Kazakhstan (Urinboyev 2017). It has been nearly 2 years since Shavkat Mirziyoyev took over the leadership of Uzbekistan. However, in contrast to early predictions, Mirziyoyev emerged as a reform-oriented, ambitious, and pragmatic leader (Pannier 2017). Unlike the late president (Karimov) who did not allow any forms of critical views, President Mirziyoyev openly acknowledged the failure of public policies and showed his readiness to make changes (Buckley 2018). He is actively and publicly pursuing a number of simultaneous reforms to change the everyday life norm from "people should serve the government" to "the government should serve the people." What is especially relevant with regard to anticorruption is that he began his reforms by asking for input from citizens through online reception systems, commonly known among ordinary people as "portals" (e.g., https://my.gov.uz/oz). These provide information about the government and encourage citizens to report problems with service provision and corruption and give feedback on state policies. These online reception systems enable ordinary citizens, even those living in remote villages, to file complaints and request assistance on various issues.

However, it remains to be seen if the anticorruption initiatives of the new Uzbek leadership will produce any tangible results in the long run. In spite of the recent positive changes, deeper systemic and structural problems still remain unaddressed by the new Uzbek government. A recently published study indicates that online reception systems have had a very limited impact on the peripheries of Uzbekistan where there are no viable forms of accountability or incentive mechanisms that can make local government officials act in accordance with the centrally designed policies and laws (Urinboyev et al. 2018). It is highly likely that the Karimov-era type informal governance practices will persist unless measures adopted to promote good governance go beyond official proclamations and rhetoric. Accountability schemes need positive and negative incentives that are enforced from above in order to bring about real positive changes in everyday life. In the light of ongoing changes in Uzbekistan, there is a need for further research that investigates the state of corruption and the governance trajectories in the post-Karimov period.

## Concluding Remarks

The chapter shows that the corruption in Uzbekistan is not only the outcome of kleptocratic practices and dysfunctional state institutions but is also a reflection of the general informalization of the state and society. Due to the inability of state to

provide adequate social protection, the general population of Uzbekistan is compelled to turn to an informal coping mechanism to "get things done." Both people and public officials are increasingly reliant on the informal economic system. From this perspective, the apparent resilience of corruption in Uzbekistan, despite innumerable anticorruption and good governance projects of both Uzbek government and international actors, resides in its embeddedness in informal forms of coping strategies, and might be viewed as a result of the "absent state" that fails to meet the basic needs of its citizens. Any attempts at eliminating informal livelihood strategies, without creating alternatives, might destabilize and create social discontent in an already troubled and impoverished Uzbek society. Hence, anticorruption measures are not simply a matter of getting people to obey the law. It is more importantly about promoting socioeconomic change.

### Synonyms

Developing countries; Ethical decay; Institutions; Judicial corruption

### Definitions

**Corruption** This is a well-calculated transactional process involving the exploitation of public authority for personal or sectional advancement at the expense of the larger society; corruption may boost a person's or a group's economic position or noneconomic status.

**Transaction** This is a bargaining process that involves two or more parties negotiating on which items or kinds of favors to be offered in order to bend public sector procedures, processes, or institutions. It normally ends up with the "giver" receiving skewed service from a public officer.

**Corrupter** This is an entity that attempts or accepts to offer/promises to accept to offer an item/service of economic or noneconomic value to a public officer in order to receive skewed service or for public sector procedure to be bent. It is the supply side.

**Corruptee** This is the public officer who makes a demand or accepts an offer from an entity, either in cash or kind in order to provide a skewed service or bend public service procedures and processes to favor the "offering" entity.

### Introduction

Corrupt transactions involving public officials have serious negative ramifications on the entire facet of the political system including, inter alia, economic growth, general societal and people's welfare, justice system and business operation in the polity (Chen et al. 2015). For instance, a 2015 International Business Attitudes to Corruption Survey reports that corruption remains a major cost for honest companies who more often than not, lose out to unethical companies who bribe their way through (IBAC Survey 2015). In the report, 30% of respondents argue they have failed to secure contracts where there was strong circumstantial evidence of bribery by the successful competitor, thus making corruption a greater hazard to international business and similar transactions. More than 19% believe that refusal to pay bribe would cause significant delays and costs to business, while 3% believe it could make businesses "grind to a halt." We will lift our eyes upon the state, where cometh our help? This obviously is the cry of defenseless individuals and groups in any state, especially, developing societies. *Perhaps*, the legal system or court is a redeemer of those afflicted by corruption, injustice, and "mafiaism" in the system.

To restore hope in corruption control, the judicial sector [justice system] of countries provides, perhaps, a critical arena to prosecute all corruption cases in an attempt to deter the process; it becomes paradoxical and perhaps suicidal if the judicial sector itself is neck-deep in corruption or portrays an appearance of impropriety. In its 2007 Report, Transparency International observes how corruption tends to undermine justice in many parts of the world and how it denies victims and accused persons a fair hearing in trial processes. In the local arena, a corrupt justice system polarizes and divides communities by keeping alive the sense of injury created by unjust treatment and mediation; it also undercuts confidence in governance and fuels corruption in all sectors of government (TI 2007). The abuses, malpractices, and corruption in the public sector of Ghana have received massive media attention and public outcry at least within the last decade. Ghanaians have been introduced to new lexicons and catchphrases such as *gargantuan corruption*; *create, loot and share*; *to show or not to show* which resonate corruption scandals in the public sector. The latter reminds people of perhaps the highest corruption scandal that has bedeviled the Ghanaian Judiciary. Consequently, people's confidence in the public sector has reduced and risks even reducing at an alarming rate (CDD-Ghana Report 2014).

Mostly, people tend to argue that these malpractices proliferate because the system is weak and deficient in the public sector of developing societies. However, conventional wisdom posits that a system is as good as the people who make it. If the people are good, the system will be good and conversely, if the people are bad, the system will be bad. This is because people who engage in corrupt practices covertly do it in a well-calculated manner at the blindside of the existing rules and systems (see Jávor and Jancsics 2013; Yeboah-Assiamah and Alesu-Dordzi 2016). Ghana, especially, in the Fourth Republic has created a number of institutions and passed a number of laws, ostensibly, to check corruption and abuses. However, this effort does not commensurate with the actual successes in terms of raising standards in the public sector (Yeboah-Assiamah and Alesu-Dordzi 2016; see also Simelane 2012 on Swaziland). Simelane provides that the Swaziland Anti-Corruption Commission has largely been ineffective, it is unable to catch the "big fish" because of their connections with influential and powerful actors in society and in the public administration.

In a related discussion, Yeboah-Assiamah and Alesu-Dordzi (2016) define corruption as a transactional process and further conceptualize how this bargaining process occurs in the public sector. The transactional model views corruption as a typical bargaining process where public officials discharge public duties not necessarily based on "spirit of the law" but on how best clients clandestinely transact business with them. This reflects in a transaction between a judge and his client when the former promised that "*Oh I will get him off the hook on Friday but everything would depend on you*" (http://www.myjoyonline.com/news/2015/September-9th/anas-expose-judges-have-collapsed-some-are-trying-to-resign.php). In other words, actors would bargain and the consensus reached holds, irrespective of the rules of the game or institutions in place. This is because actors could easily work at the blind side of the system. This argument has been explained that "to every code, there is a decoding mechanism that is usually known by the adopters or the code makers; therefore, it becomes a wild goose chase if public officials and the technical men become part of the corrupt system or syndicate" (Yeboah-Assiamah and Alesu-Dordzi 2016, p. 215).

How does corruption really occur? How do actors transact to achieve results in spite of rules and systems in place? These questions remain largely unanswered in the literature. Studies and reports on public sector corruption mostly depend on accounts of people's perceptions and beliefs (IBAC Survey 2015; Desta 2006; Transparency International Reports), audit reports, and remnants of corruption which mostly make it difficult to really determine the veracity, volume, nature, and extent of this clandestine transaction (Serra and Wantchekon 2012). Most studies on corruption would design questionnaires and interview guides to seek perceptions [from the corrupt officials themselves]; the answers obtained may not

reflect the entire truth as respondents are likely to filter their responses (Desta 2006). This article addresses the gap by using an empirical evidence of judicial corruption scandal which hit the public sector of Ghana in 2015 best described as "transactional model of corruption in action." This time it is not about opinions or views or expectations, but the actual behavior of public actors when in camera or in their private "chamber" [office] with their clients. The study is underpinned by the following key research questions. How do corrupt public officials interact with their clients in the execution of public business? How do the key actors in corruption broker their corrupt transaction and how does it even get started? How does corruption compromise the public official's decisions with regard to public interest?

## Conceptual Overview: Corruption as a Transaction

The complex nature of corruption emanates from the fact that it occurs between rational individuals or actors with an agenda to conspire to transact illegally. In other words, the person corrupting and the person being corrupted had to have agreed to do something illegal; only in the case of such a mutual conspiracy will bribery and corruption prevail. From that transactional perspective, Barr and Serra (2010) designed a bribery game which simulates petty corruption as an exchange between secretive individuals and public officials whereby the private individuals make a proposal on what and how much to provide to the public official in order to receive a favored service, which may include, inter alia, "a reduction in tax, preferential treatment in a court hearing…" (p. 3). On the other way round, the public official must also make a decision either to accept the offer in its form or to negotiate further on how much bribe to accept. The authors argue that irrespective of how it gets initiated, "if a bribe is offered and accepted, the briber-bribee pair benefit, while other members of society incur a cost" (ibid., p. 3).

It is within the foregoing context that this entry adopts an operational definition of corruption as "*a well calculated transactional process involving the exploitation of public authority for personal or sectional advancement at the expense of the larger society; that the 'beneficiaries' of corruption may be individuals or groups; that corruption may boost a person's or a group's economic position or non-economic status*" (Yeboah-Assiamah et al. 2014, p. 193). The process is rational and well thought-through as both parties to the transaction "would make and receive any offer, after carefully assessing the prevailing circumstances, systems and the other partner or actor in order to avoid any possible challenge of being caught or setup" (ibid.).

### Conceptual Framework: Transactional Model of Corruption

In proposing a transactional model of corruption, Yeboah-Assiamah et al. (2014, p. 193) conceptualize corruption as a "calculated transactional process involving the exploitation of public authority for personal or sectional advancement at the expense of the larger society: that, the 'beneficiaries' of corruption may be individuals or groups, and that, corruption may boost a person's or group's economic position or non-economic status." However, this earlier version appeared "dyadic" in nature without highlighting the role of intermediaries. Consequently, this earlier version was modified by acknowledging the role of intermediary in the transaction (Yeboah-Assiamah and Alesu-Dordzi 2016). This is illustrated in Fig. 1.

The model explains corruption as the result of a transaction between actors who exhibit a relationship. In this relationship, one actor (corruptee) makes a demand, either in cash or kind, and the other actor (corrupter) supplies the demand (UK-AAPPG, 2006). Either the "corrupter" or "corruptee" can be the first to kick-start the transaction, but a consensus is reached after each actor carefully assessing other intervening elements which include, inter alia, the context, content of corruption item, process, and the perceived corruptibility of the other actor(s) involved as well as how the system operates. To minimize the risk, either the corrupter or corruptee mostly engages a "conduit" or intermediary who could be a relative, agent, or friend of either of the two parties to

**Corruption in Public Administration: Stabbing the African State in the Back, Fig. 1** Transactional model of corruption (Source: Adapted from Yeboah-Assiamah and Alesu-Dordzi 2016)

intermediate certain phases of the process. The model explains that while corruption may benefit those who engage in it, the net effect on the entire society in terms of how it affects development, growth, and human lives can be devastating (see also Barr and Serra 2010). The proliferation of such transactions could depend on the individual's personal attributes and/or general societal attributes including prevailing political, social, and economic conditions.

## Methodology

As hard as it is to pounce on individuals or actors transacting corrupt deal, this study uses an empirical evidence of judicial corruption scandal in the public sector of Ghana to address the gap in the corruption literature of public administration. The data present how some justices of the lower and superior courts of Ghana and members of the judicial service transact corruption with "victims of the law" with the help of intermediaries. These empirical data were made available through an investigative work of a renowned journalist, Anas Aremeyaw Anas who has gained international repute [even acknowledged by Obama as far back as 2009] for his exposé on public sector corruption in Ghana and Africa (https://en.wikipedia.org/wiki/Anas_Aremeyaw_Anas).

The role of the media, which is facilitated by media freedom and democratization, is imperative in corruption combat (see Bhattacharyya and Hodler 2015 *on stylized game theoretic model on democratization and media freedom in corruption control*). For instance, Gould (2001, p. 768) observes that "a vigilant, well-supported, freely inquiring press provides a means for the public to monitor governmental activities including the extent of corruption in higher places; in several countries, alert newspaper professionals have helped 'break' major scandals." In this particular exercise, the undercover investigation of Anas Aremeyaw Anas which is reported to have been carried out over a 2-year period [between 2013 and 2015] saw him simulating as a relative or friend of an accused person [real accused person standing trial in court but mostly without the accused's knowledge] offering to pay bribe to judges in exchange to "turn the course of justice" or to have the accused freed. In order to have real evidence, the undercover investigator used portable disguised hidden cameras [sometimes his pen in the shirt pocket, eye lens or even buttons] on him each time he interacted or dealt with the officials. At the end of the reported 2-year exercise, the journalist and his team made available [screen publicly] a video footage of 34 judges [corruptees] involving 12 high court and 22 lower court justices seen transacting and taking bribes

mostly with the help of some members of the judicial service and other networks [intermediaries]. The video recordings and transcripts of these proceedings have been made public (http://graphic.com.gh/news/general-news/49877-hundreds-queue-to-watch-anas-video-at-aicc.html) and culprits have received various forms of sanctions with many of them sacked from the judiciary (http://www.myjoyonline.com/news/2015/September-9th/breaking-22-judges-suspended.php). However, as scholars of public administration and governance, there are lessons for further analysis and reflections. Using the *public choice theory*, this entry discusses the transactional model of corruption and uses transcripts of Anas' empirical corruption exposé to illustrate how corrupt transaction occurs, how it benefits actors, and how it leads to net societal loss.

## Results and Discussion

The above model (Fig. 1) is given empirical support by using narratives from the real corruption simulation exercise carried out by ace investigative journalist, Anas Aremeyaw Anas and his Tiger Eye PI. The transactional model (Fig. 1) has five key elements: corrupter, corruptee, intermediary or facilitator, net social loss, and intervening factors (systems, actors, content, and context). The section discusses how each of these elements occurs in real life public sector corruption situation. In the discussion, the study uses excerpts and narratives of Anas' transcripts. In the discussion below, the following acronyms used denote the following: *Cr:* implies *Corrupter; Ce:* implies *corruptee; and I* implies *Intermediary, or mediator.*

### Supply Side of Corruption (Corrupter)

The first element of the model is the supply side or "corrupter" who provides the bribe item or money to obtain skewed services. In most of the cases, the transactions were initiated by the corrupters. The study provides two empirical support or real life setting cases to explain this element.

#### Case1: Theft Case Involving Four, One Freed Because of Bribe

In one of the cases, an accused person is charged together with three other alleged suspects; however, one of them being his [supposed] brother, the "corrupter" [undercover journalist] attempts to assess how he could get him freed of the charge. He, therefore, initiates the corruption process by passing through an intermediary (a court clerk) who happens to be renowned or notorious for that mediation role and the process becomes successful. In responding to the deal, the corruptee [judge] gives this assurance (http://www.myjoyonline.com/news/2015/September-10th/scandal-i-have-all-the-power-i-will-let-him-off-judge-tells-undercover-journalists.php):

> *Okay, but what needs to be done is, we all need to meet when the time comes. And the thing is that you go home and talk to him [suspect]. When the time comes, we would sit down and then we see what we can do. Okay?*. . . Yes, bring him on the 7th. . . *Bring him here (judge's office)*. . .*and then I would make the entry for him [before the real judgment date]*,. . . *we can even use our record here.*

The transaction eventually gets sealed when a final installment was paid, and at the end of the day, the corrupter supplies money to the judge and he obtains benefits. The corrupter was able to "buy" justice for his [supposed] brother who was acquitted and discharged while the three other accomplices were convicted, currently in prison, *albeit*, all four were involved in a GHc 1,000,000.00 theft case (http://www.myjoyonline.com/news/2015/September-10th/scandal-i-have-all-the-power-i-will-let-him-off-judge-tells-undercover-journalists.php).

#### Case 2: Notorious Armed Robbery Case

In another account, the accused was standing trial for armed robbery charge, the corrupter [undercover journalist] disguised himself as a brother of the accused, and a bribe transaction was finalized. His corruptee partner [judge] assured him that:

> It's not a big deal. I've read the docket and I know how to go around it, hmm. . .I have all the power, so no fear . . .Oh I will get him off the hook on Friday but everything will depend on you. (A high court judge) http://www.myjoyonline.

com/news/2015/September-9th/anas-expose-judges-have-collapsed-some-are-trying-to-resign.php

Surely, as promised, the bribe money was able to corrupt the judgment of the public officer who delivered skewed judgment to free the notorious armed robber even to the awe of the corrupter. Anas [undercover journalist] writes: "...all the same, we were shocked beyond believe when Justice...[corruptee name withheld], in acquitting our armed robber 'friend', read a scanty one page judgment. In three minutes, all was over. Three minutes (one page) for an armed robbery case that had lasted five solid years (2009–2014). A cry of horror nearly burst from my throat... It was nothing but shocking travesty of justice. It even became more dramatic when, in his haste, Justice... [corruptee] forgot to even touch on one of the accused persons who had early on confessed his own role in the robbery but ... [corrupt judge], in his haste after collecting the cash, had released him too" http://www.myjoyonline.com/news/2015/September-9th/anas-expose-judges-have-collapsed-some-are-trying-to-resign.php.

The evidence above provides empirical support to an earlier argument that "... irrespective of the numerous anti-corruption legal frameworks, people, especially, the elites and the 'overseers' of these institutions, gang up to act at the blind side of the institutions or laws whereby tracing their back becomes difficult" (Yeboah-Assiamah and Alesu-Dordzi 2016, p. 215). This reflects the promise given by a judge (corruptee) to a corrupter that "*It's not a big deal. I've read the docket and I know how to go around it, hmm...I have all the power, so no fear*" http://www.myjoyonline.com/news/2015/September-9th/anas-expose-judges-have-collapsed-some-are-trying-to-resign.php.

## Demand Side of Corruption (Corruptee)

Per the transactional model, the "corruptee" is the "demand side" who receives bribe items from the "corrupter" before or after [depending on negotiation] providing a particular service. This actor has two key features: (i) he abuses his/her public authority and power to obtain either pecuniary or nonpecuniary items and (ii) provides skewed service or goods to his "corrupter" either warranted or unwarranted. The features fall within a classical conceptualization of corruption as the exchange of money or favor for a benefit disbursed by a government official.

### Pecuniary Gains

From the accounts or reports, the "corruptees" received sums of money (pecuniary). In one of these, although the "intermediary" charged about 15,000 cedis (USD 3,958), what the "corruptee" actually received was 10,000 cedis (USD 2,638) which was paid in two installments. This reflects in the final discussion between the intermediary and his boss "corruptee," the latter (judge) made this caution:

> But since he said ten (GH¢ 10.000.00) it should be ten! (http://www.myjoyonline.com/news/2015/September-10th/scandal-i-have-all-the-power-i-will-let-him-off-judge-tells-undercover-journalists.php)

In a similar account, the brokered deal was same Ghc 10,000 and the corruptee (public official) was very much sure he could deliver his part of the deal [providing skewed service], he therefore cautioned severally his "corrupter" partner to ensure he also handles his own part well. See below http://www.myjoyonline.com/news/2015/September-9th/anas-expose-judges-have-collapsed-some-are-trying-to-resign.php:

> **Ce**: Okay it's a deal...So you have to fulfill your side of the bargaining, okay?...You deal with the matter once and for all.
>
> **Ce**: So you heard what I said?
>
> **Cr**: Yes, I've heard you.
>
> **Ce**: Otherwise, tomorrow I won't deliver. First thing tomorrow morning okay?
>
> **Cr**: Okay.
>
> **I**: So you get to me then I will get to my lord before tomorrow morning so that he can do this thing once and for all.

**Ce**: Just do it once and for all, then we free the guy. I have all the power and I will free him, so no fear

**Ce**: Oh I'll get him off, I'll get him off the hook on Friday but everything would depend on you [a notorious armed robber to be freed just like that? All because of money]

**Cr**: Thank you sir.

*Cr: corrupter or customer; Ce: corruptee or judge; I: intermediary or court clerk*

From the account above, one could notice that the public official was very convinced he could have his way through because he knows the system well and how to manoeuver his way through. It is no wonder he states "I have all the power and I will free him, so no fear. . .oh I'll get him off, I'll get him off the hook on Friday but everything would depend on you." Klitgaard (1998) provides a famous equation of corruption, **C = M + D − A** [Corruption equals *monopoly* plus *discretion* minus *accountability*]. When officials possess excessive discretion coupled with poor forms of accountability, corruption thrives with arrogance, impunity, and confidence. In his paper, Mbaku posits that "if the country's counteracting agencies (e.g., police, judiciary system) are not properly constrained by the law and are pervaded by corruption, it is not likely that these institutions will serve as effective instruments for the elimination of corruption" (Mbaku 2008, p. 453). Our entry provides empirical support to how "unchecked" administrative discretion and power could promote bureaucratic arrogance, corruption, and development retarding tendencies in developing administrative systems.

### Pecuniary and Nonpecuniary Gains

In another account, the "corruptee" obtained different forms of items, both monetary and nonmonetary in nature. These items were provided to him by virtue of his authority and his role in the service the corrupter had interest. His corruption gains were transacted as follows:

[When the accused was finally released, corruptor [undercover journalist or cr] went to judge's residence with guinea fowl, a sack full of tubers of yam and cash].

**Cr**: My lord, we're back again! [He brings out the tubers of yam]

**Ce**: Put them down.

**Cr**: We borrowed the sack so we just want to go and return the sack.

**Ce**: Ehhee! . . . . . .

**Cr**: Oh thank you sir. (corruptor [Cr] gives guinea fowl to judge).

**Ce**: What's the mystery!

**Cr**: Hahaha, Sir I want the appreciation to last long including this. . ..!

**Ce**: (Talking to one of his boys). Call XXX to come and slaughter this (referring to the guinea fowl corruptor had just brought)

**Cr**: In fact, I quickly wish to say that "when appreciation last long you'll be able to taste"

**Ce**: Yooo!

**Cr**: So my lord, we are just here to thank you; that is why we came with our brother.

**Ce**: Oh okay! Thank you very much!

**Cr**: Thank you my lord! (corruptor gives bribe money to the judge). Judge shakes hands with the money http://www.myjoyonline.com/news/2015/September-17th/how-to-bribe-a-judge-on-rape-justice-yaw-ansu-gyiabours-story.php

This suggests that the judge has abused his official position to obtain monetary and nonmonetary favor in order to provide an

unwarranted service to an alleged criminal accused of rape [a first degree felony] offence. Indeed even where there appears to be no way, corruption or bribe mysteriously makes a way. This provides empirical evidence to the growing literature on functionalist school of thought which posits that corruption at times serves as a lubricant that greases the wheels of commerce or transactions (see Mendoza et al. 2015). In a sensitive sector such as judiciary, by agreeing to transact with and accept a bribe offer, a corruptee is compromised to unduly repay in the form of services skewed to the corrupter's interest, while the supreme interest of the state and utilitarian value of society become the opportunity cost. When public officials trade integrity and good will for selfish gains, it is a reproach to the self (Kant 1994). Kant explains that "there is no possibility of thinking of anything at all in the world, or even out of it, which can be regarded as good without qualification, except a good will" (Kant 1994, p. 393). He further provides that there is good will when officials act for the sake of duty and not otherwise; "a duty is an action, which we are obligated to perform out of respect for the moral law" (Kant 1994, p. 400).

### The Connecting Factor/Intermediary or Facilitator

For illustration, the corrupter is a "dry cell" that provides energy [bribe item] to fuel the process, and the corruptee is a "bulb" [powered to provide skewed service or "light"], the intermediary becomes the conduit or "live wire" that connects the two elements or factors to produce "light energy." In the transactional model, the study mentioned that both the "corrupter" and "corruptee" mostly transact with the help of a "betweener" herein referred to as an intermediary or facilitator who greases the wheel of corruption transaction. In almost all the cases that were video-taped or audio-recorded, it was seen that the court clerks mostly served as "middlemen" between the judges and the supposed litigants. For instance, the ace investigator provides:

> One person who played an instrumental role in three of the judges' cases was called [GA], who works in the High Court in Accra. . . . Although he was on leave, everybody pointed him out as the one who mattered if we really wanted to do serious business with the judges. . . .. Often referred to as the doyen of the court, he was universally regarded as the most reliable intermediary between the judges and those who needed their special favors (http://www.ghanaweb.com/GhanaHomePage/NewsArchive/How-Justice-Ajet-Nassam-collected-Ghc16-000-bribe-381061).

As mentioned in the model (Fig. 1), actors mostly want to ensure some level of insulation in their corruption transactions and so would mostly want to have middlemen whom they know, trust and have some form of affiliation. For instance, in one of the cases, the "intermediary" happens to be engaged in this act and appears to have the trust of the judge so he was confident to proclaim to a client:

> "If it had not been that you want to (kind of) do things your own way, and not want him [. . .] – the suspect) to know, I would've asked you to ask him when he comes to court, how he sees the relationship between the judge and me. He would tell you how I relate with the judge. The judge is my father" (http://www.ghanaweb.com/GhanaHomePage/NewsArchive/How-Justice-Ajet-Nassam-collected-Ghc16-000-bribe-381061)

Surely, the paternalistic relationship between the judge and the clerk (intermediary) later appeared to be true when he was able to work the way out to get the deal sealed.

In one of the cases, it was the driver of the judge who acted as intermediary to get the corrupter introduced to the judge. This is what the investigator (Anas) had to say:

> xxx was a conduit through whom we got access to the judge, one of many conduits who kick-start the corruption chain within the judiciary. Many, like him, have acted and continue to act as bribe 'solicitors' and 'negotiators' even remitters at some point http://www.myjoyonline.com/news/2015/September-17th/how-to-bribe-a-judge-on-rape-justice-yaw-ansu-gyiabours-story.php

The quotation above was confirmed by intermediary himself, who happens to be the driver of the corruptee [judge]. Apparently, after he had introduced the corrupter to the corruptee, the former ignored the intermediary and did not want to give him his due as agreed initially. This actor [intermediary] meted out his fury on the corrupter

[undercover journalist] when the two coincidentally met at the corruptee's [judge's] residence one day which made the intermediary expose his own role in the deal. The intermediary (corruptee's driver) fumed:

> The way you were serious that day, if you had given me the money, I told you I want to help you, that evening I called you but your phone was off. And you are just dodging me to come and see this man, I was the one who introduced this man to you http://www.myjoyonline.com/news/2015/September-17th/how-to-bribe-a-judge-on-rape-justice-yaw-ansu-gyiabours-story.php

From the foregoing, the intermediary serves two paradoxical roles, both as an "insulator" and "conductor" (to borrow from light energy in physics). As a *conductor*, he serves as a "live wire" that connects corrupter and corruptee, mostly introduces the two together, and catalyzes the process. As an *insulator*, his role is to shield or provide some form of "cover" for both actors, especially, the public official, thereby reducing the risk of being suspected or exposed. The intermediary provides a protection racket to reduce the risks or shocks that are associated with the corruption transaction. This finding provides real life evidence to explain the role of intermediaries in corruption transaction in the public sector; it affirms an outcome of a bribery lab experiment which observed that "besides eliminating uncertainty, intermediaries facilitate corruption by reducing the moral costs of both private citizens and public officials" (Drugrov et al. 2014, p. 95).

### Intervening Elements

This transactional process occurs within a context where both the "corrupter" and "corruptee" rationally assess key variables. This mainly stems from the fact that each actor wants to be very careful not to be caught pants down. Both corrupter and corruptee would assess the context, the perceived corruptibility of the other actor, the existing systems within the organization, the content of the corruption money or item before the deal would be transacted.

#### Perceived Corruptibility of Actors

From the account of Anas transcripts, it reports that there were some courts where the clerks cautioned them not to even dare or waste their time to attempt bribing the judge; this was because the clerks have sufficient information on the "incorruptibility" of such judges. This is not endemic to that situation alone but mostly permeates in various public organizations. Subordinates usually know which of their superiors are ethical as well as those who are surmountable or easily fallible to corruption (see Yeboah-Assiamah et al. 2016). An empirical study by Ryvkin and Serra (2012) maintains that corruption is lowest when potential corrupters and potential corruptees are uncertain regarding each other's "corruptibility" and have asymmetric bargaining powers. This suggests that when citizens are certain or have sufficient information that an agency or official is ethically deranged, he/she is more likely to have many visiting corruption customers.

In other words, where citizens are certain on the "corruptibility" of a public official, corruption becomes more rampant. For instance, in one of the cases, the court clerk appeared to have sufficient information on the corruptibility of the judge or "propensity to fall prey" to corruption.

> **I**: . . .ask him when he comes to court, how he sees the relationship between the judge and me. He would tell you how I relate with the judge. The judge is my father.
>
> **Cr**: No problem, so then as a father and son, if you talk to him, I know he would listen, so I'm begging you.
>
> **I**: As things stand now, I don't know what the judge would say, but he's my father so I would try and see whether I can talk to him and see whether he would understand me or not. . . ., how much do you think that you can push?
>
> **Cr**: No, I don't want to mention anything, I can't mention.
>
> **I**: The issue is that (ehhh) right now, you see, these people [judges] are big men and if you want to go to them and ask anything right now, if I go to him and ask him, he'll ask me and I don't know but he may ask me

"what do you think he can do? (http://www.myjoyonline.com/news/2015/September-10th/scandal-i-have-all-the-power-i-will-let-him-off-judge-tells-undercover-journalists.php; http://www.ghanaweb.com/GhanaHomePage/NewsArchive/How-Justice-Ajet-Nassam-collected-Ghc16-000-bribe-381061)"

In another account, the subordinate (court clerk) had sufficient information on the corruptibility of his superior (judge) and was very confident in negotiating and transacting on his behalf. In other words, because he knew how his boss behaves, he could fetch customers or potential bribers to him and could even coach the customers on what to tell him. See the insert below:

**I**: . . .You give me two (GHc 2,000.00) then you give him three (GHc 3,000.00), you know I'm going to do the talking and I'll know how I'll convince him. Tell him . . . you're promising that you'll get back and get him his additional 7,000 cedis; you get what I mean? He'll understand. He's not a difficult person.

**Cr**: (Me too) I understand you too but that means (it is between) the pair of you when the money gets to him, he's not going to see you at all?

**I**: No, oh no, how possible is that?

**Cr**: You brought the customer?

**I**: No, these people we've been working with them for a long time and we know how they are. When something gets into their hands (that is it,) that is it! They would not, assuming I'm going to benefit from whatever they had I wouldn't have told you of the need to do whatever for me, no they'll not. Me, the only thing I like about him in particular is that when I tell him something, he respects me and does whatever he's supposed to do, that's the one thing about him [the subordinate is very sure of the corruptibility and ethical decadence of his boss]

**I**: Don't worry, don't worry. You as I said ehhh, do as I said when he comes. We'll get to him, myself I'll do a lot of talking http://www.myjoyonline.com/news/2015/September-9th/anas-expose-judges-have-collapsed-some-are-trying-to-resign.php

From the discussion above, one could suggest if subordinates have symmetrical information on their superiors' corruptibility, it tends to create a more unethical organizational climate through a cascading effect (see also Yeboah-Assiamah et al. 2016).

### Setting the Corruption Context: Outsmarting the System

In the corruption process, actors engaged in various activities set a right context to make this clandestine transaction very successful. In one of the accounts, the intermediary (a court clerk), in his determination to set context right to catalyze the corruption process, had to outsmart the existing system. This, he assured his "corrupter" partner that:

> Everything is now in my hands, I'm going to push everything, even the docket and everything are with me. You know he's [judge or corruptee] on transfer from the other block to this side; I'm going to do everything and bring it here. There are little, little connections I have to do. . .; you understand, I must make sure the case comes before him, you understand; some people must get something small, small (http://www.ghanaweb.com/GhanaHomePage/NewsArchive/How-Justice-Ajet-Nassam-collected-Ghc16-000-bribe-381061).

### "Dark Technical Advice" to Clients/Formidable Networks

Similarly, after receiving bribes, corrupt officials often provide technical details to their clients in order to speed up and catalyze the service to be delivered. This process [further bribing or softening grounds] at times could be done directly by the corruptee who would give part of his/her corrupt booties to their other counterparts or could direct, instruct, or guide the corrupter to that powerful actor too on what exactly to do.

In one of the accounts, the judge after agreeing to the corruption deal figured out how they could plan to act at the blind side of the law or system in order to acquit and discharge the accused. He had this to say:

> *Okay, but what needs to be done is, we all need to meet when the time comes. And the thing is that you go home and talk to him. When the time comes, we would sit down and then we see what we can do. Okay?*... Yes, bring him on the 7th... *Bring him here (judge's office)...and then I would make the entry for him [before the real judgment date],... we can even use our record here* (http://www.myjoyonline.com/news/2015/September-10th/scandal-i-have-all-the-power-i-will-let-him-off-judge-tells-undercover-journalists.php).

In another account, the corruptee [judge] provided coaching support or "technical advice" to his partner in crime [corruptor] on what exactly to do, which other officers to further bribe and how best to go about it. See the discussion below:

**Ce**: Now if you would like to see the state attorney yourself, then maybe you can come to the court tomorrow. I'll get somebody to take you to him

**Ce**: ....If you come, say that you are after xxx...he is my boy and then tell him that you are after me....

**Cr**: Okay my lord

**Ce**: So I'll ask him to take you to the state attorney and then you find something and put it in an envelope,...Ghs200, GHc 300.00, whatever your strength would be, put it in an envelope nicely. When you come we'll take you to him. That you're begging him, the boy is your elder brother and its because of him you have come from the university so you beg him, any help he can offer but as to the meeting between us, even lawyer xxx (corrupter's own lawyer and brother) don't tell him http://www.myjoyonline.com/news/2015/September-17th/how-to-bribe-a-judge-on-rape-justice-yaw-ansu-gyiabours-story.php

The systems and procedures in executing public service mostly involve different offices and officials; therefore, a corruptee usually guides his clients on which actor to further engage so as to make the process easier and doable. A corruptee who receives bribe has to find a way through, either by doing it directly or indirectly coaching his client. This reflects the "technical advice" given to a client by his partner [corrupt official] that: "*I even advised him [client's lawyer] that he should try and see the state attorney.....he should try and go and find something for him ... in such cases the state attorney too is very important so what steps has he taken to see the state attorney, and then you can go and find some kola for him"* http://www.myjoyonline.com/news/2015/September-17th/how-to-bribe-a-judge-on-rape-justice-yaw-ansu-gyiabours-story.php The investigative journalist, Anas, provides that http://vibeghana.com/2015/09/25/sex-for-justice-court-clerk-busted-in-anas-video/: *"the situation at the Somanya District Court appeared sordid. It was a complete network, starting with the clerks through the prosecutors and ending with the judge. As a result, the judge, investigator and court clerks were all 'sorted out' to influence a defilement case. They suggested changing the defiled victim's age from 13 to 20."*

### Secrecy of the Process

Because corrupt actors operate at the thin margins or blind side of systems and rules, they do so cautiously to prevent the system's light to be thrown on them. Actors engaged in corruption mostly feel uneasy and are filled with fear, especially, if the partner is not a very familiar person. It could also be observed from the accounts of the investigation that the "corruptees" were very cautious of the corruption process; this is because they did not want to be caught by the system. Through whatever means, actors attempt very hard to transact in a calculus way at the blind side of the system. This could be found in what appeared to be the uneasiness on the part of a corruptee after receiving the bribe payment. This is illustrated in the discussion below:

(At this juncture, Tiger (investigator or corrupter) hands over bribe sum of GHc2000.00 to Justice xxx [ce], he accepted it and put it beside him)

**Ce**: Don't Tell Anybody About The Bribe [Pleads With Ce] (Hidden Camera Footage)

**Ce**: Thanks! Please I beg you, sit down (referring to Tiger who was still standing after giving the money to the judge)

**Ce**: Please you know our work; these things are very dangerous.

**Cr** & voice: Yes sir

**Ce**: So you are two and I am three (referring to the number of people they are in the room) so let this thing remain in this room, I beg you.

**Cr**: Okay my lord, okay my lord

**Ce**: ....even your brother, lawyer xxx; don't tell him.

**Cr**: No, no, no my lord we will not tell him http://www.myjoyonline.com/news/2015/September-17th/how-to-bribe-a-judge-on-rape-justice-yaw-ansu-gyiabours-story.php

This same caution and suspicions could be found in another case where the corruptee appeared skeptical. But for the intermediary or facilitator attempting to shield the corruptor by referring to him as a brother, the deal would not have been successful. That kind of assurance by the intermediary gave the corruptee some form of assurance or "safety net" which later appeared to be false.

**Ce**: As I was saying, some people would be talking talking...!

**Cr**: Mmm, oh my lord, my brother here has already cautioned me a lot on that [talking] and I assured him that as for me ...

**Ce**: Somebody will be talking to you and then they would be recording you any moment.

**Cr**: Oh, no, no! [meanwhile, he was recording]

**I**: My Lord, that is one caution I gave him.

**Cr**: He really cautioned me and I told him as for us, we are genuinely here to beg for our brother, so we can't do that.

**I**: My Lord, actually I have assessed him and I really believe that he's a brother [this had not been done but was trying hard to catalyze the process] (http://www.myjoyonline.com/news/2015/September-10th/scandal-i-have-all-the-power-i-will-let-him-off-judge-tells-undercover-journalists.php; http://www.ghanaweb.com/GhanaHomePage/NewsArchive/How-Justice-Ajet-Nassam-collected-Ghc16-000-bribe-381061)

### Net Social Loss

In the transactional model, the authors posit that the process results in benefits to both the corrupter and corruptee and perhaps, the intermediary, but the net effect is a societal utilitarian loss. The utilitarian principle provides that actions of public officials should provide value to greater majority of people; but when actions are triggered by corruption or bribe payment, the hallmark of statesmanship is relegated to the background. In these cases revealed, it could be observed that public officials who are to safeguard the state and society against exploitation and potential harm end up betraying this noble duty as a result of corruption or bribe acceptance. Negotiating and accepting bribe to release criminals unto the street is a perversion of justice, a direct betrayal of public trust and actors stab the state in the back where she bleeds and cries profusely without help. The undercover investigator in disappointment scribes "*...when cash determines life and death, when criminals are unleashed onto society, when the solution rather is the cause, one wonders where*

*to begin when the source of corruption itself is the court*" http://www.myjoyonline.com/news/2015/September-17th/how-to-bribe-a-judge-on-rape-justice-yaw-ansu-gyiabours-story.php.

### Consciousness of Consequence

In most cases, public officials who engage in unethical acts appear very much aware of the effect of their actions and inactions on society and organization. That notwithstanding, they may still go ahead by ignoring its implication on wider citizenry. For instance, in one of the cases, in brokering a deal involving an accused armed robber, the intermediary [court clerk] had this to say:

> robbery actually in this country is a very serious offence, it's a first degree [felony or offence] and when somebody commits that offence and maybe you even leave him, the whole country would be watching you. so normally when they commit such an offence and we go on to help them, the only help is to consider certain things so that they give them a minimum sentence https://www.ghanacelebrities.com/2015/09/11/anas-reveals-how-high-court-justice-charles-quist-released-an-armed-robber-who-stole-over-ghc-11000-for-ghc-4000/

However, upon final transactions and the money involved, the corruptee [judge] paid a blind eye to the net consequence of releasing a notorious armed robber unto the street. Motivated by monetary gains, he was of few words and his interest was to summarily acquit and discharge the armed robber. He promised his client that: "Just do it once and for all [bring all the money], then we free the guy. I have all the power and I will free him, so no fear. . .Oh I'll get him off, I'll get him off the hook on Friday but everything would depend on you." In this case, everything will not depend on the law, the offence committed, or utilitarian effect on society but on how much money the corrupter is able to raise and on time.

### Mistrust in State Institutions, Institutional Degeneration, and Insecurity

In cases above, the society and people are at risk because armed robbers and rapists are likely to be released without appropriate trial; these individuals are more likely to go about their activities with impunity and even increase their territories so as to gain more money to offer "better bribes" next time. If people perceive that a notorious robber and rapist has been unduly released, the effect is that they are more likely to lose confidence in the public administration system and may resort to instant justice (Yeboah-Assiamah and Kyeremeh 2014). With this singular transaction, there will be general sense of insecurity in society, and people will begin to lose trust in public institutions and law enforcement agencies, which is problematic to democratic consolidation and development.

In Tamale, a high profile case of rape where the accused was sentenced, but on appeal, and with a reported pecuniary payment of Ghc 2000, the judge subsequently releases the accused. In other words, when corruption or bribe payment comes in, even high profile cases tend to lose their logic and intensity which could now be handled like a "child's play." This is how one writer puts it:

> Through the help of the Judge's driver, Tiger [undercover journalist] managed to lead the family of the accused to (Justice xxxx's house), where the matter, which was as crucial as a 'world cup final' to the victim and her family, ended up being played out like an inconsequential friendly match, kicked off, all with a GHc 2000.00 ceremonial handshake http://www.myjoyonline.com/news/2015/September-17th/how-to-bribe-a-judge-on-rape-justice-yaw-ansu-gyiabours-story.php

For instance, by paying bribe, a judge could decide to "throw away" a land dispute case before him or her http://www.myjoyonline.com/news/2015/September-17th/how-to-bribe-a-judge-on-rape-justice-yaw-ansu-gyiabours-story.php. This could be suicidal because, in Ghana, land disputes, in most cases, have led to "land guards" syndrome which at times, have involved fatalities. Fictitiously throwing away such cases in court may not lead them to rest in a healthy manner; the party who feels cheated is likely to devise and adopt an unorthodox means, *albeit,* unjustifiable. This will further deepen the general sense of insecurity and mistrust in state institutions (Transparency International 2007). The public official cares less about the net consequence on society, but his motivation is the benefits or richness he is to obtain. This emphasizes the conceptualization of public sector corruption by

Blackburn et al. (2010, p. 4) as "an illegal or unauthorized profiteering by public officials by exploiting their positions in public office to maximize their private gains."

### Loss of State Resources: "Throwing Away" or "Failing to Recover"

**Throwing Away** In most cases, the actions of corruptees and corrupters have led to a colossal loss of state resources; these same scarce resources could have been used to promote socio-economic well-being of the citizenry. Public officials tend to abuse their authority to trade the state for their own selfish gains, and in some cases, by just trivial gains, they sacrifice the supreme state interest and utilitarian values of society. Public officials cause malfeasance to the state, instead of being trustees of the state, they rather end up milking or causing others to milk the state. In the end, the actors in the corruption transaction benefit while the greater majority becomes victims. These judges caught on tape taking minor pecuniary gains as bribes, and one could easily infer that high profile economic cases involving the state, private citizens, and companies could also be thrown away [*first degree felony cases of rape and armed robbery were even made foolish cases* https://www.ghanacelebrities.com/2015/09/11/anas-reveals-how-high-court-justice-charles-quist-released-an-armed-robber-who-stole-over-ghc-11000-for-ghc-4000/; http://www.myjoyonline.com/news/2015/September-17th/how-to-bribe-a-judge-on-rape-justice-yaw-ansu-gyiabours-story.php] easily upon receiving "better" bribe payments. This has serious implications on socio-economic development. This provides support to a position held by Barr and Serra (2010, p. 3) whose bribery game simulation led to a conclusion that "if a bribe is offered and accepted, the briber-bribee pair benefit, while other members of society incur a cost."

**Failing to Recover** The perpetuation of unethical conduct in the public sector could partly be attributed to most of these clandestine judicial transactions which may make people act unethically with impunity. If there is a term "throwing away cases" on the basis of corruption or bribe payment and not necessarily merit of the case, then public officials may not necessarily care when found between acting legally or illegally. The accounts and revelations suggest that even important cases that could have brought about financial resources to the state could easily be "thrown away" without justice. For instance, Mr. Woyome was alleged to have fraudulently secured huge payments of about GHC51, 283,480.59 (equivalent to USD 13,372,485.03) as judgment debt which the state was pursuing to get the money recovered. The argument is that if an ordinary young man [low status in society] could easily transact corruption with judges to get a murderer and rapist freed, it may perhaps be relatively easier for people who have strong connections with politicians and corridors of power to do so with ease (http://www.ghanaweb.com/GhanaHomePage/NewsArchive/artikel.php?ID=257186). Assuming [without admitting] that a judge manages to throw away this case, the whole state loses and may open flood gates for others to follow. Meanwhile, a then trial judge [of the Woyome case] was busted (both audio and video footage) in Anas investigation "in the act" of a different corruption http://www.myjoyonline.com/news/2015/September-9th/anas-investigation-cites-34-judges-others-in-massive-bribery-scandal.php.

## Conclusions and Policy Implications

This study contributes to existing literature on public sector corruption by using empirical evidence to highlight the transactional nature and how the deals finally lead to skewed public service delivery. More importantly, the study contributes to knowledge and strategies on corruption control. Specifically, the chapter makes a modest contribution by answering these key questions: How do corrupt public officials interact with their clients in the execution of public business? How do the

key actors in corruption broker their corrupt transaction and how does it even get started? How does corruption influence the public official's decisions with regards to public interest? The study finally contributes to literature on corruption control as it draws useful lessons to inform policies on the design of anticorruption strategies.

Firstly, it could be observed from the study that corruption is a well-calculated transaction by those who partake in the action; that is, actors engage in dark networks "to act-against the law" and attempt through all means possible to keep it from "glare of the public." Each of these actors is rational in nature and seek some returns from the corruption transaction by cautiously assessing the actor(s) involved, the content of the bribe items, the systems in place, and how to "outsmart the system."

Narratives from the study illustrate how corruptees (public officials) mostly outsmart the system or rules through inter alia, technicalities, grey areas in the system, administrative discretion, forging allegiance with other officials who matter in the process [dark networks as argued by the social network theory, see Hu et al. 2009], and providing coaching support to their "corruptors" or "partners in crime" on how to catalyze the process. This conclusion provides support to an empirical finding in Hungary by Jávor and Jancsics (2013) that even where there are mechanisms to check corruption, managers at the various levels of the organization have their own machinations "technicization" to side-step and trick the system to have their corrupt way through; people engage in a formidable network to "eat up" the technical quality of systems. For instance, the investigation by Anas reveals how such clandestine networks had been formed by relevant actors to outsmart the system by acting at the margins and blind side of the rules.

Secondly, the study concludes that any attempt at fighting corruption that concentrates just on systems without a significant focus on the human element is more likely to be outsmarted. This is because a rule or system is nothing more than a toothless bulldog barking without biting if the system does not have persons of integrity to apply it prudently. In other words, systems and rules especially in developing countries will only be effective in controlling corruption when linked with a process that pays attention to building people of integrity and honoring ethical people. The study has provided that rules are mere provisions which require people to execute and if the enforcers are part of a syndicate, they will inadvertently dilute the potency of the existing rules and systems to have their way through. Observing the role of people in administration, Wriston maintains, "I believe the only game in town is the personnel game; my theory is that, if you have the right person in the right place you do not have to do anything else, but if you have the wrong person in the job, there's not a management system known to man that can save you" (cited in Foulkes and Livernash 1982, p. 43).

Thirdly, the study concludes public officials who engage in corruption mostly know the negative net effect of their actions and inactions on society but tend to rationalize or just blink an eye to it. In his decision to take bribe and broker a deal to set an accused armed robber free, the actor knew the consequence and even explained to his corrupt partner. In spite of the risk associated, actors are still headstrong and broker deals, because of monetary payments [other gains] involved. That is why it is mostly argued that money is sticky, the lack of it, the desire for its acquisition, or the fear of losing it – brings out the worst in human nature. The public sector according to this narrative attracts greedy and ruthless people who have no hesitation in being manipulative, exploitative, and devious, willing to do anything for unorthodox personal enhancement. This conclusion is well explained by the public choice theory which maintains that individuals are fundamentally egoistic and self-seeking who enter into relationship or transaction based on careful calculation of benefits and costs.

Consequently, addressing corruption in the public sector requires a holistic and integrated approach which is well discussed in a recent publication dubbed *"Strong Personalities" and*

*"Strong Institutions" Mediated by a "Strong Third Force": Thinking "Systems" in Corruption Control* (see Yeboah-Assiamah 2016). Relating it to the conclusions, controlling judicial corruption should take into account the integrity levels of public actors through ethical training and measures aimed at recruiting people with high integrity; additionally, there is a need to reform the criminal procedures to actively reduce the high levels of discretionary powers of judges. This could be possible when there is high level of accountability on the part of "Lords of the land" to provide justifications for their actions and inactions. Finally, the role of the "third force" or civil society acting to throw much sunshine in the judicial operations would help to compel accountability from judges.

## Synonyms

Bribery; Crime; Exploitation; Extortion; Fraud; Graft and malfeasance

## Introduction

The signing of Comprehensive Peace Agreement (CPA) between Sudan People's Liberation Movement/Army (SPLA/M) and National Islamic Front (NIF) of Khartoum government in 2005, and subsequent referendum that led to the birth of South Sudan as Africa's newest country in 2011, was a sign of hope for the people of South Sudan to embark on peace, unity, justice, equality, and prosperity. Unfortunately, the national vision for equitable distribution of wealth and resources (sharing of national cake) among the South Sudanese has never been realized because of corruption, which is caused by a number of factors. These include political instability, poverty, weak property rights, contagion from corrupt neighboring countries, low levels of education, low economic and press freedom, lack of democracy, ethnic divisions, weak judicial and internal control system, gender inequality, lack of government decentralization, and low degree of regional and global economic integration.

This article tacitly acknowledges the complexity and sensitivity of the nature of corruption in South Sudan as habitual "malady" which requires collective, and yet, global action in order to fight against it. It also attempts to discuss a few of the prevailing nature and causes, and consequences of corruption in South Sudan, which is considered nowadays as Africa's youngest and yet fragile and/or failed state.

The outbreak of civil wars in December 2013 and July 2016, and the ongoing fighting between Salva Kiir's Sudan People Liberation Army/Movement (SPLA/M) and Riek Machar's Sudan People Liberation Army/Movement In-Opposition (SPLA/M-IO), reflects a longer-running crisis of governance marked by nepotism, corruption, income inequality, ethnic functionalism, maladministration, conflict of interest, moral decay in the ruling party, and a growing divide between the state and society. It also reflects unresolved historical grievances from the previous civil war and the failure of the CPA period to support healing and reconciliation at community, state, and national levels and to address issues related to corruption in the country.

## Theoretical Conceptual Framework

The term corruption stems from the Latin word "*corruptus*," which means to destroy, ruin, and/or waste. Theoretically, "corruption is a form of behavior, which departs from ethics, morality, tradition, law, and civic virtue" (Globalization of Corruption). It is a complex and problematic word, which denotes, among others, lack of integrity, bribery, misappropriation and mismanagement, moral decay, ambiguity, nepotism, embezzlement, extortion, conflict of interest, and misuse of power for personal gain. This definition is consistent with World Bank, Transparency International and UN's *Global Program Against Corruption* view that corruption is abuse of power for personal gain in both the public and private sectors (UNODCCP 2004).

In South Sudan, corruption has become a sociopolitical and economic "disease" for development that has eaten both private and public sectors of the government since the signing of the (CPA) in 2005 and post-independence in 2011, and the subsequent referendum of 2011. In the current system of Government in South Sudan, whether petty, grand, and systematic, corruption is an apparent irregularity that touches the life of every South Sudanese. The corruption we are referring hereto is manifold. It dates back to post-colonial Sudan and post-CPA era, Barnabas (2007) observes that corruption and fraud in both South and North Sudan general take the form of bribery, theft, nepotism, unmerited promotion to

high ranks in public service, tax evasion, diversion of government revenue and electoral fraud. The Southern Sudan Anti-Corruption Commission's (SSACC) definition of corruption, however, extends beyond to include issues of conspiracy between private actors and public officials for their mutual or private benefit, conflict of interest, formulating policies, and legislation so as to unduly benefit specific groups, sexual harassment and trafficking of influence, among others (SSACC 2009). All these factors deter good governance. Good governance requires extraordinary level of integrity, transparency, and accountability for social, economic, and political development. Precisely, good governance entails: "(1) political legitimacy for the state through democratic elections and transfer of power and an effective political opposition and representative government, (2) accountability and transparency in the sharing of information, (3) separation of powers, (4) effective internal and external audit, (5) effective means of combating corruption and nepotism, (6) competence of public servants, (7) impartial and accessible justice systems; and (8) the absence of arbitrary government power" (Balboa and Medalla 2006).

Frankly speaking, corruption is a common social phenomenon in the South Sudanese society, predominantly among the government officials. It has destroyed the conscience or principles of South Sudanese society to engage in economic, social, and political development. In Corruption Perceptions Index 2016, South Sudan scored 11 in corruption in Sub-Saharan Africa (Transparency International 2016). This means that "poorly equipped schools, counterfeit medicine and elections decided by money are just some of the consequences of public sector corruption. Bribes and backroom deals don't just steal resources from the most vulnerable – they undermine justice and economic development, and destroy public trust in government and leader" (Transparency International 2014), in South Sudan. Most of the government officials have become so corrupt that they have misappropriated state funds in order to enrich themselves. Some government dignitaries in Juba possess big and expensive cars and houses within and outside the country at the expense of others to the extent that there are two class societies emerging in South Sudan today: the exceedingly rich and the extremely poor.

## The Nature and Causes of Corruption in South Sudan

As noted previously in the introduction, the nature and cause of corruption in South Sudan are vast and the causes are complex in nature. These include, *inter allia,* political instability, poverty, weak property rights, contagion from corrupt neighboring countries, Low levels of education, low economic and press freedom, lack of democracy, ethnic divisions, gender inequality, lack of government decentralization, low degree of integration in the world economy, weak civil participation, and low level of political economic accountability and transparency.

## Legislation

Under the Presidential decree no. 1, and Southern Sudan Anti-Corruption Commission (SSACC) Act 2009, inter alia, were established as mechanisms to fight against corruption, theft of state resources, and money laundering. "In generating corruption reports SSACC adopts a variety of approaches. These include face-to-face reporting11, statutory reports by public officials12, open media sources13, official reports14, official databases15, anonymous reporting, intelligence production, complaint boxes and inter-agency information sharing" (Dut 2016). Even so, SSACC and SSPC as internal control systems seem to be ineffective in tracking down and dealing with corruption cases because despite President Salva Kiir's advocacy for the principle of "zero tolerance to corruption" during independence celebration that he would "as President do all . . . (he) can to remove this cancer of official corruption" (Othow 2011), fraud and dishonesty in management of public funds in the South Sudan are still alarming. Majority of South Sudanese believe that the public officials in the current GoSS are greedy, ignorant, and incompetent. This clearly explains that there are no clear

and sound laws established in South Sudan to check the abuse of power by the executive, judiciary, and legislature.

## Judicial System

Like any other organ of government, the law of South Sudan had mandated the judiciary to be independent body, but the whole system is very frail and unproductive. For example, South Sudanese have lost trust in South Sudan Police Service (SSPS) as service providers because the police and other security providers are widely perceived as corrupt and ineffective, and they act with impunity and demand for bribes while undertaking operations (HRR 2015). This means that it is easy to detect corruption but hard to punish agents who offer or take bribes.

## Macroeconomic Policies

Generally, South Sudan's macroeconomic policies are aimed at reducing the inflation rate and increasing employment. The fiscal and monetary policies are employed to stimulate economy and cool down the rate of economic growth with major objectives such as fighting inflation, stabilizing interest rates and exchange rates, and economic growth. As a rule, monetary policy in its broader context can easily harm the poor through inflation, output, and increase in real exchange rate (Spiegel 2006). Although monetary policy may lead to deterioration of exchange rate, it can make South Sudan more competitive and create more jobs for the citizens as well, if the root causes of corruption are effectually addressed. However, government macroeconomic policies are weak, and this is evidenced by narrow taxation, high government expenditure, and public debts (external and internal borrowing).

## Financial Mismanagement

There is no pressure to correct public financial management problems in the current GoSS. Neither the Legislative Assembly (LA) nor the Council of Ministers (CoMs) testifies to the public on any action taken by the government to understand or tackle corruption cases and budget proposals/recommendations. What is hindering these institutions is that there is no proper and effectual law, and corruption polices, and measures to carry out investigations on corruption cases and prosecute individuals or group of individuals involved in corruption. This provides a partial explanation as to why South Sudan has poor auditing institutions (Poor institutions here denote lack of direct or indirect participation of the citizens to the budget process and to public information on budgetary issues.) such as the Auditor General Chamber and the Anti-Corruption Commission, and the Legislative Assembly (LA) is not very strong.

Due to unclear guidelines and records, millions of dollars had disappeared into thin air since the establishment of the GoSS in the name of ghost-workers, fake invoices, illegal taxes, nepotism, and other backdoor practices. Cases in points are many. In 2008, the MPs of Unity State blamed the State Governor for misappropriating about $122 million; on December 5, 2008, a government official was caught carrying $3 million in his briefcase; on March 31, 2009, *Al-Wifaq* Newspapers reported that SDG 4 billion disappeared from the Ministry of Education in Northern Bahr El Ghazal State (Oduho 2009); between June and July 2009, a government official from MoEST wired $ 323,060 from scholarship fund meant for South Sudanese students studying in Kampala to a personal account of Mr. Felix Clive Arim Oceng, a Ugandan (Thon 2011). In 2012, President Salva Kiir accused 75 government officials for stealing $4 billion from the Reserve Central Bank of South Sudan but no further action is taken. World Bank reported that $22 billion from oil revenue was embezzled by government officials, an amount that is equivalent to Ghana's annual revenue, thus a country with a population of 22.5 million people, for about 20 years (Quoted in Nyamilepedia 2016). As result, the opaque management of the country's oil-rent has permitted the high-ranking government officials to siphon funds with impunity (FitW 2015, in South Sudan Corruption Report). Alluding to United Nations Office of Drug Control and Crime Prevention, South Sudan's:

> "Officials who work for or supervise revenue-collecting agencies, such as tax authorities, customs, public utilities... solicit bribes..... Civil servants... accept cash payments in order to alter tax files (income declarations) of individuals or organizations.... Officials ....illegally transfer funds and park them in accounts earning interest for themselves. Also, public officials are in a position to manipulate for their benefit foreign exchange rates.... Customs officials ... receive bribes in order to ignore legal or illegal imports or exports that have taken place. In this way, the payment of duties and levies is avoided at the expense of the national treasury. In addition, dangerous or prohibited goods [especially illicit proliferation arms] cross national borders" (UNODCCP 2004) are quite appalling.

Contrary to the advocates of decentralization system of governance, the way GoSS carries out its budget execution are diametrically opposed to international standard with regard to how public funds are spent and how the resources are generated because of low capacity, weak accountability sector, and public financial management law to control civil servants. Ministry of Finance (MoF) faces the problem of accountability at the level of state agency. Reports from the state MoF (2011–2016) shows that some spending agencies are not accountable, meaning very few produce statement of accounts for the funds they obtain from the MoF. Thus, money is released and spent, but there is not accountability. Moreover, prior to 2013 and 2016, ethnic and political conflicts, the oil-rent, and non-oil revenues are not appropriately translated to the benefits of the citizens because public spending is politically vested in the hands of the powerful military elites and public officials. This partly explains why the public resources are haphazardly allocated to the poorest states or regions, particularly those who are most in need of investment – resources go to those who have access or channels to the "national-cake." The evidence from the Statistical Yearbook for South Sudan (2009–2016) is indicative of this problem.

## Corruption, Ignorance, and Poverty

In an emerging society like South Sudan, there are excessive demands and public outcry, which call for more budgetary allocation by government agencies. However, owing to rampant poverty, corruption, nepotism, tribalism, and ethnic tensions, the question of transparency and accountability as the core values of public budgeting remains unanswered. Therefore, focus on poverty alleviation and policy choices are decisive for enhancing transparency and accountability in South Sudan. This is because lack of transparency could easily destabilize the structural relationship (country-ownership) between the Sudanese people and their government, and pave ways for irresponsibility and mismanagement in fiscal and political administration. Noticeably, it is apparent that the cases of mismanagement, corruption, and maladministration in the GoSS are intentional while others unconsciously arise from ignorance. The ignorance we are referring to here is not only lack of formal education but also lack of technical know-how, and/or weak technical and human capacity, lack of critical evaluation of the environment, and the human condition among the South Sudanese people. The Oil-rent has been an obstacle to upholding the principles of good governance and sustainable development because of corruption and mismanagement of public fund. Corruption eats so deep into the narrow tax-based economy of the country, and the narrow tax-based economy is further hardened by the fact that the impeaching poverty into the society gives no consideration for fair treatment and service delivery to the people who have just come out of war and are now back to fighting each other.

## Public Procurement

The public services sector is highly corrupt because the government, particularly SPLM officials, demand for gifts or other irregular payment from companies to obtain operating licenses and gain access to public procurement contracts award and construction permits (ES 2014). The government officials lack the necessary knowledge and skills for management of public fund to the extent that bulk of government contracts were awarded without due regard to competitive bidding (Barnabas 2007). Prior to the 2009 Appropriation

Act, most the contracts signed in South Sudan were not approved by the Parliament.

Thus, most businesses depend on connections in the government and the military – as these are the main contractors – bribes and other corrupt means to win public contracts (BTI 2016). Public officials often circumvent or influence procurement procedures, suggesting high rates of favoritism in the sector (Gan 2017). As a result, companies that are partially or fully owned by ruling party SPLM or SPLA, officials are more likely to win public contracts irrespective of the quality and price of their services (Gan 2017). According to Athorbei (2010), the government investigated and found that bags of "Dura" (sorghum) worth more than SDG 80 million that was meant to be distributed to the 10 States disappeared in thin air. As noted and acknowledged by The Voice of America and Transparency International, "...bribes and backroom deals don't just steal resources from the most vulnerable, but also undermine justice and economic development and destroy trust in the government" (Voice of America 2014). These are not merely figures and assumptions, but true indicators that there are weak spots in social, economic, political, and legal system of the government, which pose lots of challenges to peace, unity, stability, and progress in South Sudan as Africa's youngest nation.

## Public Services

In Public Service, South Sudan's "property rights are not well protected and customary land use rights have been replaced by more formal laws, leading to conflict in many communities (BTI 2016)." Most of the recruitment in public service sector is centered on one's allegiance to the SPLM/A instead of merits. There are several "ghost workers" that have inflated public pay rolls (Gan 2017).

## Nepotism

Certainly, corruption and institutionalized nepotism in the South are the main obstacles to service delivery and infrastructural development due to lack of human resources capacity in different units of the GoSS (Kuol 2007). While majority of the respondents argued that decentralization system is imperative for equitable distribution of resources, it remains uncertain whether the question of fairness and equity *vis-a-vis* national philosophy, justice, liberty, and prosperity, would solve the problem of corruption given that there is lack of fiduciary mechanism (duty of trust, care and devotion) and weak institutions with limited accountability and financial control. This is because, hitherto, the country continues to suffer from unfair distribution of resources and/or "national cake," unemployment, ethnic politics of divide and rule, rebellion, greed for power, lack of democracy, and good governance due to incompetent leaders. In fact, the failure to make a transition from military rule to civilian rule explains the lack of understanding between the state and SPLM. In most cases, SPLM is equated to the state. "South Sudan One Year On: From the World's Newest State to Another African Story," Mairi John Blackings argued that "the failure to separate the state from the party and the attendant failure to institute checks and balances within the various organs of the state lie at the centre of the general air of malaise suffocating and squeezing life out of the nascent nation state of South Sudan. . ." (Mairi 2002).

## Freedom of Speech and Press

Through the 2013 and 2016 Non-Governmental Organization (NGO) Act, the government restricted freedom of speech and expression and obstructed criticism by ". . .monitoring, intimidating, harassing, arresting, or detaining members of civil society who publicly criticized the government" (HHR 2015). Several media houses and civil society organizations that engaged in criticizing the government were shut down. For example, *Nation Mirror* (September 14, 2016) and *The Sentry* (November, 2016) were closed down because of criticizing the government on misuse of public funds. Besides, *Eye Radio* was closed

for a week for airing a voice clip from SPLM-IO leader Riak Machar (Africa News 2016). Human Report (2016) further indicated that several journalists and media houses have suffered from violence and harassment by security forces. Indeed, "security forces confiscated or damaged journalists' equipment and restricted their movements. During the year, journalists were interrogated, harassed, detained, and imprisoned, and there were instances of severe violence and suspicious death" (Gan 2017) by National security service (NSS), SSPS, and SPLA. Cases in points are: "On July 16, Alfred Taban, a journalist and editor in chief of the *Juba Monitor*, was arrested after publication of an editorial in which he called for the removal of President Salva Kiir and First Vice President Riak Machar, criticizing them for their failure to implement the August 2015 peace agreement. . . . And "On October 11, Malek Bol, a reporter for the Arabic-language daily *al-Maugif*, was found badly injured and showing signs of torture in a cemetery in Juba. . . . In December 2015, NSS members arrested Joseph Afandi, an editor for the Arabic daily *El Tabeer*, at the newspaper's offices in Juba after he wrote an editorial critical of the ruling party. . . ." (Human Rights Report 2015).

## Combating Corruption and Strengthening Whistle-Blowing

Corruption obstructs the efficiency of public services, enlarges the costs of public transactions, and destabilizes confidence in civic and/or public institutions. The need to fight and curtail corruption and strengthen whistleblowers is yet another area of concern in South Sudan. The GoSS should therefore instigate forensic accounting. Forensic accounting is vital for holding those who abuse public fund accountable before the court of law. It could also act as a mechanism for observing ethical codes of conduct, promoting public integrity and reforming bad habits of civil servants. Furthermore, a strong and sound law should be put in place to protect whistleblowers by strengthening internal control units or independent institutions such as SSACC and the South Sudan Audit Chamber. The government should empower both public and private institutions, strengthen hotlines, and combat conflicts of interest among public bureaucrats, particularly in areas such as public contracts and procurement management to "ghost" companies. However, without building strong political will and human capacity, fighting corruption will not be an easy project to embark on.

# Corruption Management in Africa

Adewale K. Kupoluyi
Department of Political Science and Public Administration, Veronica Adeleke School of Social Sciences, Babcock University, Ilishan-Remo, Ogun State, Nigeria

C

## Synonyms

Accountability; Africa; Corruption management; Good governance; Public sector

## Definition

The deliberate and sustained efforts by African states at preventing, controlling and curbing the use of public positions to illegally acquire unmerited privileges, favors, and resources.

## Introduction

Africa is a continent that is blessed with abundant rich human and material resources. These endowments have not been maximally used to provide basic social and infrastructural amenities for the people. What has been responsible for this is the endemic corruption that is plaguing the continent, going by Transparency International's Corruption Perceptions Index, which identified Africa as the most corrupt region in the world (CPI 2010). Corruption is the securing of wealth or power through illegal means, engaging in private gains at public expense or the misuse of public power for private benefit (Lipset and Lenz 2000).

Africa's predicament is compounded by bad leadership that has made it elusive to achieve good governance, even though some of its leaders are accountable, visionary, patriotic, and have sacrificed greatly towards making their countries a pride of place among comity of nations. Despite

the huge oil wealth and abundant resources endowments, Africa is today the poorest region of the world (Collier 2007). The prevailing situation suggests that corruption has gradually become a common feature of many African states, cutting across both the public and organized private sectors. The focus of this section is on public sector because it largely controls what happens to other sectors.

## Corruption

Corruption is complex to define. It can simply be been described as the illegal, dishonest, destructive, conscious, and well-planned act by a person or group of persons, to appropriate, by unlawful means, the wealth of another person or group of persons (Okolo and Akpokighe 2014). Pre-colonial Africa was founded on solid and strong ethical values that promote justice, equity, and development of the human society with disdain for corrupt practices. African nations, before the coming of the colonialists, laid much emphasis on strong moral values (Okolo and Akpokighe 2014). Such moral values abhor corruption and dishonesty. Corruption was seen as antithetical to African pride and dignity that cherish good societal values and morals. Nowadays, corruption is rampant and has eaten deep into the fabrics of many African nations, due to loss in values and morality. Global perceptions about graft in many African countries indicate that graft has become endemic and systemic in both public and private sectors (Okolo and Akpokighe 2014). Manifestations of official corruption include examination malpractices, adulterated foods, misappropriation, embezzlement of funds, and the use of proxy names to buy expensive property (Okolo and Akpokighe 2014). Corruption has become an enemy among African nations.

Bureaucratic corruption is common among less developed countries. Corruption remains a big issue because it stifles growth, enhances inequalities, and reduces government's capacity to respond to people's needs (Salisu 2000). Ake (1991) noted that the social impact of corruption involves the creation of an atmosphere of tension, dishonesty, weak, and/or selective law enforcement that breeds cynicism and erosion of faith. Therefore, corruption does not offer anything good for the development of Africa. Many reasons have been adduced for why corruption is prevalent in Africa. These range from the existing bureaucratic loopholes, nonconformity with traditional religious tenets and importation of values/ideals that are alien to African culture (Okolo and Akpokighe 2014).

A cursory look suggests that something drastic should be done to bring Africa back to the path of integrity and corrupt-free society, as much as possible. The reality on ground today calls for monetary and fiscal philosophy that would vigorously tackle corruption, waste, inefficiency, poor governance, and inequitable distribution of wealth (Kupoluyi 2016). These unethical attitudes among the people have encouraged the emergence of new breed of public servants (Okolo and Akpokighe 2014). Public servants that do not faithfully adhere to their professional ethics to always be faithful at all times and at great cost. It is on this basis that Maduegbuna (2005) had decried that, the benefits of corruption seem to be greater than its consequences when it comes to national development. This should not be. Collective wealth should not be controlled by few privileged persons at the detriment of the majority. People with questionable means of income are often celebrated while honest and dedicated public servants, who have not stolen or accumulated illegal wealth, while in active service, do not command much respect from the society, unlike persons of such questionable wealth. Corruption constitutes great obstacle to democracy and makes people to distrust heir leaders by developing nonchalant attitude and apathy towards public policy planning and implementation (Kupoluyi 2012). Nothing legitimately can ever to too much to do to end corruption in Africa.

Corruption has remained a serious development issue in Africa and that is why important organizations such as the United Nations, through its Sustainable Development Goals (SDGs), is striving to promote high level of accountability

and transparency in public service (Jaiyesimi 2016). Due to the seemingly complex nature of corruption, a deliberate, systemic and sustained approach is needed to curtail and curb graft in government. Collier (2010) asserted that apart from internal and local factors, some Western multinationals are allegedly aiding and abetting corruption in Africa, especially in the areas of natural resources' exploration and exploitation in countries like Nigeria, Benin Republic, Cote D'Ivoire, Angola, South Africa, Burkina Faso, Guinea Bissau, and Sao Tome and Principe. In looking for solution, searchlight should be beamed on local and international collaborators in order to achieve desired results.

## Western System of Corruption Management

Many schools of thought have attempted to explain what can be described as the Western approach to curbing corruption. What is central to this system is that, the entire process is totally subjected to the modern process and procedure of adjudication, rule of law, and due process of proper investigation, trial, and prosecution. There are a number of legal instruments and institutions existing for the management of corruption in Africa, including the media, as the watchdog and mirror of the society. From the 1950s till date, several laws and institutions had been put in place to fight corruption across Africa without yielding fruits.

In Nigeria, these include anticorruption apparatus and institutions include the Nigeria Police Force; Code of Conduct Bureau, as provided for in the 1999 Constitution of the Federal Republic of Nigeria (As amended); the Economic and Financial Crimes Commission (Establishment) Act of 2004 (EFCC Act, 2004); and the Independent Corrupt Practices and other related offences Commission Act of 2000 (Anti-Corruption Act, 2000). Certain corrupt practices that are criminal in nature are covered under the Criminal Code Act (CCA, 2004), the Penal Code Act (PCA, 1960), the Administration of Criminal Justice Act (2015), and the Whistle-Blowing Program, among others.

However, Western approach has appeared not to be effective in fighting against corruption in Africa, mainly due to failure of state institutions to make this possible. For instance, the Federal Government of Nigeria is strengthening its anti-corruption device by leveraging on the Mutual Legal Assistance (MLA) agreements it signed with six other countries to get wanted fugitives and corrupt persons alongside their loot repatriated back to Nigeria. The MLA countries include United Kingdom, Switzerland, United States of America, Italy, South Africa, and United Arab Emirates (The Punch 2017). Nigeria and the United Arab Emirates have also signed an agreement on the recovery of assets and cash stashed away in UAE. Both countries signed the agreement regarding the apprehension of criminals, extraditing convicted persons, providing mutual legal assistance in criminal matters, legal and judicial cooperation in civil and commercial matters. The deal includes Judicial Agreements on Extradition, Transfer of Sentenced Persons, Mutual Legal Assistance on Criminal Matters, and Mutual Legal Assistance on Criminal and Commercial Matters.

However, with the existence of strong institutions and bureaucracies in developed economies, they are not completely immune from corruption. Official misdemeanor was prevalent and recurring decimal in the public sector fiscal and monetary activities, as manifested in the failed privatization process, undermined economic reforms, deterred trade and investment, among others (Atwood 1998). Arbitrary arrests, torture, and delays in the dispensation of justice have equally been linked with the Western system, which is a symptom of corruption-laden setting. It is on this premise that Fatile (2012) alluded to the danger of relying solely on the Western approach to curbing corruption because of the erroneous impression that once graft cannot easily be easily discovered, or that if they are, they cannot be proved, and proved, it cannot be tenable. Western approach to curbing corruption is laced with many shortcomings that corrupt-minded persons often rely on to beat the state.

## African System of Corruption Management

In the management of corruption, the Afrocentric views stress the need to adopt indigenous approach to curbing graft in Africa (Ekeh 1975). The Afrocentric scholars argue that pre-colonial African leaders were more responsible and responsive to their subjects and avoided corruption, as much as possible, unlike what is obtainable in the present day Westernized society. It maintains that traditional African leaders in the pre-colonial period could hardly be said to be corrupt, because of the communal spirit that guided their operations (Igboin 2016). Although, there were extremely and very few reported cases of kings and chiefs being suspended or sent to exile for "corrupt" practices, and of individuals punished for corrupt behavior because they are guided by strong religious and moral rules (Igboin 2015). Generally speaking, corruption was not a regular feature in African societies in the past.

Storey (1953) pointed out that, before political independence, there were some cases of official misuse of resources for personal enrichment. As much as the Western model is formally structured, scholars like Ekeh (1975) further argued that the model has not helped in curbing corruption because of the "loopholes" and "lacuna" inherent therein. Historically, there was a remarkable difference in the patterns of colonial administration and practices in Africa, as colonialism was markedly different from the colonial experiences found in the Americas, Europe and Asia. There seems to be insufficient attention being paid to corruption and the incidence of development administration and the imperative for institutional overhaul and transformation of Africa's public administration (Amadi and Ekekwe 2014).

African traditional approach involves the use of home-grown weapons such as taboos, norms, superstitions, sanctions, and culture to control and curb corrupt practices (Olutoyin 2014). It is a process that is used to determine whether an accused person is truly guilty or not, of corrupt allegations. The steps involved in adjudication on corrupt cases entailed that an allegation is raised; deities/gods are consulted; investigations are carried out to ensure that innocent persons are not punished; and sanctions are pronounced on guilty persons; while opportunity for appeal is opened to aggrieved parties, severe punishment or acquittal is given. Such is found among the Yoruba people, domiciled in the South-Eastern part of the Republic of Benin, contiguous with Yorubaland in South-West of Nigeria.

Gennaioli and Rainer (2005) agree that the structure of African societies has largely helped in no mean way in curbing corruption. Taboos and superstitions were also introduced as weapons in the implementation of the African traditional approach. Taboos are seen as a moral ambience or moral codes intended to create harmony and order (Magesa 1997). They are powerful even though they are neither codified nor contained in any written law. To ensure fairness and avoidance of arbitrariness, African tradition puts the relevant checks and balances in place to ensure that this is done. For better corruption management to take place, there is the need to harmonize both African and Western approaches in Africa.

## Conclusion

Corruption management in Africa can be effective and efficient by combining both the Western and African traditional systems. Respective governments should enhance accountability and transparency by strengthening local institutions to ensure that relevant legislation are properly applied and enforced. The media should always mirror the society by exposing corruption. Whistle-blowing policy should be further strengthened. African governments should fund anti-graft agencies better for optimal performance. Diligent prosecution of corrupt cases should be pursued to logical conclusions. African leaders should muster the necessary political-will to end corruption by showing good examples. There is the need for more and open deliberation of policy issues involving civil society groups and actors, to challenge elite interests in the fight against corruption in Africa.

## Definition

It is important to stress that no definition of corruption is completely clear-cut (Svensson 2005). Transparency International (2016) characterizes corruption as "the abuse of entrusted power for private gain" and has been widely adopted.

## Introduction

Corruption was not part of the international research agenda until the 1990s. Partly driven by the waves of democratization and globalization, the theme has gained worldwide attention since then. Recent studies on the subject have consistently maintained that corruption delays and distorts economic development; preempts basic rights and due process; and diverts resources from basic services, international aid, and countries' economies (Johnston 2005).

The following sections summarize the recent research agenda on corruption in Brazil. The first section analyzes how corruption is being internationally measured and how Brazil scores in the most employed corruption assessments. The second section details how corruption was understood in Brazil before the boom in the international anti-corruption agenda. The third section deals with different approaches taken by corruption studies in the country in the last years. In the conclusion, I discuss the growing attention directed to the field due to recent scandals and I stress the need for establishing methodologically and theoretically strong approaches in corruption studies.

## The Scenario in Brazil: Perception and Experience Measurements

Measuring corruption is a difficult task, both due to the secretive nature of the phenomenon and to the variety of forms it may take. In recent decades, the research agenda on corruption, insofar as empirical approaches are concerned, has followed different paths. It has, for example, developed perception and experience measurements that try to capture the extent of corruption in the world.

There have been studies that measure corruption based on aggregate perception measurements, such as the Corruption Perception Index (CPI) from Transparency International. The CPI was the first systematic attempt to compare perceived levels of corruption in the public sector, determined by expert assessments and opinion surveys across a range of countries. The CPI ranks countries based on a scale from 0 (very corrupt) to 100 (very clean), in the attempt to identify broader trends and contrasts. In 2018, the CPI covered 180 countries. Latin American countries continued to score poorly for corruption and Brazil was among the countries with poor scores (holding the 105th position). Brazil has fallen 8 points since 2012, when it scored 43. This means that in 2018 the country had reached its lowest mark (Transparency International 2019).

Alongside the CPI, another composite measurement based on the perception of corruption is the Control of Corruption Index indicator from the Worldwide Governance Indicators (WGI). Calculated since 1996 by the World Bank, the Control of Corruption Index measures perceptions of the extent to which public power is exercised for private gain; taking into account not only petty and grand forms of corruption, but also the "capture" of the state by elites and private interests. Brazil's score in this Index has also shown a sharp decline in the last few years. Ranging from −2.5 (lowest control of corruption) to 2.5 (highest control of corruption), Brazil scored −0.53 in the WGI of 2017 (World Bank 2017). This is the lowest indicator ever to be attributed to Brazil.

But the CPI and the WGI are not the only type of corruption measurement available for scholars, practitioners, and decision-makers in Brazil. In this regard, Transparency International produces a more objective measurement of corruption: the Global Corruption Barometer (GCB). This is the world's largest survey in which citizens are asked about their first-hand experience with corruption in their daily lives.

In the 2016–2017 GCB round, 162,136 people were interviewed in 119 countries (Transparency International 2018). The results for Brazil show that corruption is on the rise: the majority (78%) believe that the level of corruption has increased and 56% believe that the government was underperforming in the fight against corruption. Brazilians also have a high level of distrust in the political arena: both Executive and Legislative Branches are perceived to be taken over by corruption. However, when compared to other countries in Latin America, Brazil scores fairly well in regard to the incidence of bribery: only 11% of Brazilians were reported to have paid a bribe to

access public services (contrastively, people in Mexico were the most likely to say that they had paid a bribe – 51%).

The results regarding the engagement of civil society were remarkable. When compared to other Latin American countries, Brazilian citizens were the most likely to feel empowered against corruption (83%) and were the most committed to the fight against corruption: the country had the biggest proportion of people who would report corruption even if that meant spending an entire day in a Court to provide evidence.

On the one hand, the measurements based on perception have become controversial, despite their prominence in the researches. Critics argue that perceptions are not necessarily a reflection of reality and that the indexes rely on the perception of experts who many times are based outside the country in question. On the other hand, experience measurements must deal with the hesitation surrounding the interviewing method. Considering that direct questions about people's involvement with corrupt activities may intimidate interviewees, especially during a face-to-face encounter, this method could inadvertently underestimate the phenomenon.

## Brazilian Studies on Corruption

In Brazil, before the boom in the anticorruption agenda in the 1990s, corruption studies were matters of historic and sociological approaches. Studies on patrimonialism, for example, have shown how the separation between the private and public spheres in Brazil was problematic (Faoro 1958). Brazilian political thinkers from the nineteenth and twentieth centuries aimed to understand the Brazilian "identity." In this regard, the high incidence of corruption throughout the country's history has crystallized the idea of corruption as an inexorable outcome. In addition, these Brazilian historiographical interpretations have set corruption as one of the perverse inheritances of the Portuguese colonization process.

The analyses of such important "interpreters of Brazil" run the risk of essentializing corruption as an inherent aspect of the Brazilian personality. For instance, Sérgio Buarque de Holanda (1995) defended the Brazilian culture as strongly patriarchal and patrimonialist; furthermore, Roberto DaMatta (1997) emphasized the "*malandragem*" in Brazilian individual ethics and social relations. The Brazilian character – naturally corrupt – has established an analytical and conceptual trap.

In the last decades, there has been a growing effort to make our way out of this trap. Differently from Holanda and DaMatta, corruption studies no longer understand this phenomenon as a remnant of premodern and predemocratic Brazil. For example, the Federal University of Minas Gerais and its Public Interest Research Center (Centro de Referência do Interesse Público) launched the book *Corrupção: Ensaios e Críticas* (Avritzer et al. 2008) in which it is possible to find entries of themes related to corruption written by Brazilian researchers. Later, the same research center launched "Corrupção e Sistema Político no Brasil" (Avritzer and Filgueiras 2011), a collection of papers about corruption and the political system in Brazil.

Another collection of articles on corruption in Brazil worth mentioning was released in 2002. Organized by Bruno Speck, "Caminhos da Transparência: Análise dos Componentes de um Sistema Nacional de Integridade" (Speck 2002) analyzes the system of integrity developed in Brazil to fight corruption. This was one of the first attempts to understand the institutions, processes, and areas to be addressed when considering reforms aimed at systematically combating corruption.

In relation to corruption studies in Brazil, the trend of studying accountability institutions in their relation to corruption control is rising. Books such as *Corruption and Democracy in Brazil: The Struggle for Accountability* (2011), organized by Timothy Power and Matthew Taylor, and *Democratic Accountability in Latin America* (2003), organized by Scott Mainwaring and Christopher Welna, have brought forth a multitude of studies on democratic accountability in Brazil and Latin America and also on the challenges posed by the fight against corruption in the region. All these collections have in common the analyses of institutions, rules, and practices that could facilitate or curb corruption. The books

describe the scenario in the country especially when it comes to institutional design.

Even the studies that analyze corruption and its cultural aspects do not claim anymore that it is an intrinsic characteristic of Brazilians. This trend investigates how corruption relates to social practices, how it impacts the quality of democracy, and how it impacts the trust in political institutions (Moisés and Meneguello 2013).

The anticorruption research agenda has got out of the trap. Recently, the two bursts in corruption studies are related to publicly accessible administrative data and corruption scandals. On the one hand there are the construction of datasets to objectively measure corruption from administrative data and relate it to socio-economic and political variables. On the other side, there are detailed case studies of corruption scandals.

## Administrative Data and the Focus on Electoral Rules

The first burst focuses on more objective measurements and analyzes corruption through the study of administrative data. One of the most disseminated administrative data to measure corruption in Brazil is the lottery program (*Programa de Sorteios Públicos*) developed by a federal agency to oversee municipal expenditure of federally transferred funds. Since 2003, the Brazilian internal control agency (Office of the Comptroller General – CGU) has disclosed objective data on corruption involving federal resources transferred to municipalities.

The literature that refers to CGU reports has usually performed tests to understand corruption drivers and consequences. The most famous studies are those by Ferraz and Finan (2008, 2011), which used data from the lottery program's random audits to evaluate how the disclosure of the findings impacted the electoral performance of incumbents. They concluded that the dissemination of information regarding corruption in local governments had had a significant impact on the likelihood of reelection, reducing the chances by 7%. The authors also found that mayors that were on the path to being reelected were significantly associated with less corruption.

The measurement of corruption derived from these studies is a byproduct of a governmental monitoring initiative. This means that the corruption indicator established from this data (which usually comes from classifying a broad spectrum of irregularities) is comprehensive. Moreover, the municipalities are chosen randomly in the entire country, which increases data reliability and generalization capacity. Unfortunately, actual lotteries are now rarely conducted and the lottery program has undergone several methodological changes – for example, the program no longer relies on a random sample.

Another common way to study corruption from administrative data is to analyze legal proceedings investigated in a country's courts. This can be misleading, tough. Indeed, it is considered a more "objective" measurement, but it fails to consider that countries have different legal systems. Thus, when the legal system of a country is weak, cases of corruption may not be prosecuted or investigated efficiently, even if they are epidemic. Alternatively, the legal system could be corrupt itself.

## Case Studies and the Focus on Corruption Scandals

In contrast with approaches based on administrative data, there are scholars dedicated to in-depth analyses of corruption. Their research carries out detailed case studies, highlighting corruption as a process immersed in complex human interactions which do not allow for comparisons that transcend time and space.

The recent anticorruption agenda in Brazil has focused on case studies, especially on the study of corruption scandals – according to Chaia and Teixeira (2001), the majority of corruption studies in Brazil deal with analyses of major scandals, which have received special media attention. Taylor and Buranelli (2007), for example, analyzed six corruption scandals to understand how accountability institutions in Brazil worked together in order to tackle corruption.

After the Lava Jato investigation, corruption gained prominence in the country and generated a new flow of corruption studies focused on scandals. Lava Jato refers to Latin America's most widely known corruption scheme. Related events began unfolding in Brazil, in March of 2014. Construction companies were discovered to have been colluding with employees of Brazil's state-owned oil company to win public works contracts. The oil company's employees took bribes, while politicians obtained kickbacks as personal gifts or campaign donations (For more information, see https://cgeg.sipa.columbia.edu/policy-briefs-lava-jato). Over the last years, this Operation was responsible for a series of studies based on its findings. The problem with these case studies, besides the issues with generalization, is that selections based on media attention tend to refer to cases that are given greater priority than would usually be assigned to a case.

## Conclusion

In line with the international agenda, the Brazilian academia has, in the last decades, undertaken the task of comprehending corruption. From the development of corruption measurements that take into consideration administrative data to the studies on the biggest corruption scheme in Latin America, corruption has been a growing area of interest in Brazil. Even so, there is room for improvement: we still need to use the measurements and tools available to us critically in order to engage in comparative studies with other countries; we must develop our own corruption measurements, especially ones that are appropriate for the local level; furthermore, we must use more robust theories – that view the phenomenon from the country's perspective without falling into the trap of the essentialization, – and more robust methodologies, – that go beyond case studies and administrative data.

In recent years, the country has experienced a solid increase in laws and institutions that promote transparency and accountability. While progress has been made to combat corruption, no overarching policies have been set in place to address the structural causes of corruption throughout the country. It becomes necessary to understand the anticorruption institutional architecture; how it could be strengthened; how coordinated accountability institutions and efforts have been made; how could we strengthen accountability, fight corruption, and safeguard the country's democracy at the same time.

One of the biggest challenges for this research area now is to engage discussions on corruption with democratic theory. Is it possible to defend an intrinsic connection between democratic principles and corruption control? What are the costs of corruption for the country? Have the recent scandals promoted political instability? What are the unintended consequences of the fight against corruption? Surely, it is urgent to link the anticorruption agenda with a broader defense of civil and political liberties, as well as human rights. This has been a missing link in the anticorruption agenda in general, but it must be taken seriously in a country whose political leaders claim to fight against corruption while they undermine basic citizens' rights.

# Corruption, Iran

Majid Zamahani
Department of public Administration, Payam Noor University, Tehran, Iran

## Synonyms

Blackmail; Bribery; Cheating; Embezzlement; Extortion; Fraud; Nepotism

## Definition

The abuse of public power, most often for personal gain or for the benefit of others.

## Introduction

Corruption has been an omnipresent and universal phenomenon. No society is free from it. Literature of corruption show that it is an ancient practice that has been traced back to prebiblical times and made itself known in the ancient civilizations of China, Greece, India, and Rome. In this regard, Thakur (1979) opined, a review of penal codes utilized in various ancient civilizations clearly demonstrate that bribery was a serious problem among the Jews, the Chinese, the Japanese, the Greeks, the Romans, as well as in the New World. But over the recent decades, the issue of corruption, abuse of public power for personal gain or for the benefit of others, has attracted interest among academician and policymakers.

## Public Administration and Corruption

Public administration refers to the administration of public affairs and is distinguished from business administration which is associated with private enterprise. Over the years, scope of public administration has considerably increased (Pasricha 2003: 5). Public administration consists of all those operations having for their purpose, the fulfillment or enforcement of public policy as declared by competent authority. Wilson (1941) believes that "public administration is detailed and systematic application of law. Every particular of law is an act of administration." According to Gulick and Urwick (1937), "administration has to do with getting things done; with the accomplishment of defined objectives". Public administration is that part of the science of administration which has to do with government, and thus concerns itself primary with the executive branch where the work of the government is done, though there are obviously problems also in concerns with the legislative and judicial branches.

Therefore, corruption takes place as an outcome of deficiencies in the existing public administration systems as well as cultural, economic, political, and social factors. It hinders economic development, reduces social services, and diverts investments in infrastructure, institutions, and social services.

## Iran and Corruption

Iran is a developing country which has begun its economic development plans about six decades ago. During a decade before the victory of Islamic Revolution in 1979 in Iran, the extreme increase in price of oil caused all economical programs to be changed. Foreign income of selling oil ended up with squandering and importing luxury and consumer goods. Expensing this amount of money in cities increased the volume of governmental organizations. Moreover, it developed assembly industries and promoted villagers to immigrate to cities. Little by little, the manner of consuming and following "west" luxurious lives crept into Iranian society. Foreign products were welcomed by people. Importing and distributing foreign products was expanded thereafter. Along with the increase of prices of merchandise and inflation, the unproductive service activities were replaced with productive activities. Middle level of society, which had been formed many years ago, enlarged abruptly. Although the income of the people seemed to be increased, their distribution was done unfairly. The gap between the poor and the rich became wider and wider.

This transition period caused the increasing cost of government and resultantly corruption became more contagious in the society and among the officials of Monarchy. Collective hatred toward corruption of Monarchy in Iran was a significant cause that brought about the Islamic revolution of 1979. William H. Sullivan, the last US ambassador to Iran observed the high level of corruption among the officials of Monarchy as an important factor of collapsing Shah's (kingdom) regime in 1979 in Iran (Sullivan 1982).

Islamic Republic of Iran was established when the Iranian ejected "Shah" (King) from the power in 1979, and immediately after, the new constitution based on Islamic ideologies and values came into effect. Therefore, a corruption-free country expected to be established in the new era. In the first decade of the new political system in Iran, the level and prevalence of corruption was very low and there was no concern about it. But by the end of Iran-Iraq war in 1988 and beginning the development plans, the problem of corruption reappeared in the society and became people's major concern, which still preoccupies their daily life.

Increasing level of corruption in the country resulted that Iran's supreme leader "Ayat-Allah Ali Khamenaei" to issue a decree in "eight articles" in 2001 about the problem of corruption in the country and asked officials to be more serious in combating and preventing it. Emphasizing on lucid economic activities, avoiding of rent seeking, avoiding of monopolization, resurrect the investment, and employment are some specifications of the mentioned decree. The supreme leader in his decree which is known as a "Governmental Decree," also asked to establish a special staff along with a comprehensive program to fight corruption. Immediately after, a special committee was established to take the necessary measures against corruption. The president, the head of judiciary system, and the head of parliament were the members of this committee.

## Level of Corruption in Iran

Transparency International Corruption Perceptions Indexes (CPIs) show that the level of corruption is very high in Iran. According to evaluations by Transparency International, Iran is placed in a group of countries with a high index of corruption. On a descending scale of 100–0 (with 0 representing total corruption and 100 total lack of it), Iran scored 29 in 2016. According to this scale, in 2016, Iran is placed 131rd among 167 countries.

## Causes of Corruption in Iran

The causes and sources of corruption are not only varying from country to country, but also from one time to another in the same country. The

causes and sources of corruption in Iran are also many and varied. However, for the sake of convenience and clarity, they will be classified under the following broad heads, namely, administrative, socioeconomic, and political (Zamahani 2006).

### Administrative Causes

The administrative causes of corruption in Iran are varied and complex and rooted in the country's bureaucratic traditions and social history. Corruption tends to flourish when standards are lax or poorly defined, regulatory institutions and enforcement practices weak, and government policies generate economic rents. The opportunity for corruption is a function of the size of the rents under the control of a public official, the discretion that official has in allocating those rents and the practical accountability that official faces for his or her decisions. Generally, the administrative causes of corruption in Iran may be listed as follows:

1. The weakness and inefficiency of administrative structure: Parallel organizations and lack of logical relations between them to present the services to the citizens
2. The wide and complicated bureaucracy which encourages the illegal ways of doing work in the administrative system
3. Vague, interpretability, complex, deficient, and consecutively changing rules and regulations cause the corruption in the administrative system
4. Lack of effective and sufficient control over the bureaucracy
5. Appointing the unskilled and unspecialized people to significant jobs through nepotism in the organizations
6. Existence of unofficial groups and networks in organizations because of poor management
7. Lack of transparency and responsibility of the top officials against community, citizens, and public opinion
8. Lack of job security and possessing more than one job by managers and employees and resultantly lowering the useful working times in organizations
9. Lack of participatory management system and domination of the unscientific management methods in organizations
10. Lack of effective and continuous assessing of the organizations' performances in the country
11. Lack of effective and well-developed system of punishment and encouragement in the organizations which discourages the entrepreneurship and encourages the corruption
12. The public goals and functions are not well defined
13. Instability and weakness in policy making
14. Increase in employees
15. Lack of effective social security system
16. Citizens' unawareness toward their own legal rights and the services which organizations have to present
17. Weakness and inefficiency of inspective units in organizations
18. Lack of an independent organization to fight corruption
19. Inefficiency and weakness of judiciary system
20. Inadequacy of current rules for preventing corruption and also supporting the corrupt officials by political parties
21. Discretionary power of public managers: Monopoly power of officials over goods and services, discretionary power in deciding who gets the goods or services or how much they get, and lack of accountability
22. Weak of mechanized systems and information technology in organizations
23. Weak and inefficient salary system in the country so that the deference between salaries in public and private sector are very high
24. Inadequacy of the law-enforcement system and judiciary in detecting corruption crimes and punishing corrupt entities, as well as breaches of the principle of inevitability of punishment
25. Inadequacy of mechanisms to protect human and citizen rights, the legislation, and social justice
26. Poor oversight and scrutiny over the performance of public administration

### Socioeconomic Causes

The socioeconomic causes of corruption in Iran may be listed and explained as follows:

1. Government involvement in economy and private markets: Government involvement in economy and private markets in Iran dates back to centuries gone by and is commonly seen as a source of corruption. It has been suggested that the overall size of the government budget relative to GDP may therefore be positively correlated with levels of corruption.
2. Rent-seeking structure of economy in Iran: Rent-seeking and corruption among the public officials and powerful individuals has been a serious problem in the country during the last two decades. Sources of rent-seeking in Iran are numerous, which make a large part of income and payments of the government in the economy.
3. Governmental monopoly: Monopoly management of government on big and important companies in the country has enabled the government to interfere in the market and giving possibility to public officials to abuse the public power for own benefit. These State Companies which have employed half of the public servants are mostly suffering loss and cause corruption in the society.
4. Lack of clearness in the financial position of the public officials: One of the existing problems which cause the corruption in the country is the lack of the clearness in the financial position of the public officials when they are possessing a job and changing in their financial position during possessing the job. Clearness in the financial position of the public officials can help the controlling over their properties to prevent corruption.
5. High rate of inflation and unemployment and mistrust to future: The high rate of unemployment and inflation has also been a cause of corruption in the country during past decades.
6. Unfair and improper distribution of incomes and subsidies: Increase in poverty and inequality in community which are the causes of corruption are consequences of unfair and improper distribution of incomes and subsidies in the country.
7. Inequality in income and expenditure: Inequality in income and expenditure of the public servants and lower income householders is another cause of corruption in Iran. When officials are unable to meet their minimal living costs from their salaries, corruption will always be prevalent. But the relationship between salary levels and corruption is complex. Low salaries can provide a powerful incentive for officials to become corrupt, but they only form part of the environment in which corruption flourishes. The incidence of corruption depends more crucially on the wider economic, political, and social context.
8. Weakness in laws and regulations: One of the causes of corrupt behavior is improper and weak laws and regulations particularly in the financial and economic policies. Improper economic policies in Iran have pushed the economy toward the black market and unofficial economy.
9. Level of economic development: Levels of economic development do affect the forms and sectors where corrupt transactions take place. Petty corruption is particularly prevalent in developing countries where it is necessary to pay a small bribe to secure services that ought to be provided free of charge. While this practice has largely disappeared from many developed countries, their greater public resources and higher incomes mean that corrupt transactions tend to be grand rather than petty.
10. International corporations: Corruption in international corporations particularly arises from mining and oil/gas concessions and construction projects in Iran. International corporations are the supply side of grand corruption. If they do not offer bribes to gain contracts, concessions, and exemptions, there would be a dramatic fall in corruption. The need of international corporations to enhance their profitability drives them to seek new markets and new opportunities. Competition with other international corporations means there is always a search for competitive

advantage and corruption is often seen as an important and necessary method of enhancing or securing profits.

11. Inefficient tax system: Inefficient tax system and tax evasion constitute another cause of corruption in Iran.
12. Discrimination: Discrimination is also a significant cause of corruption in Iran. According to Tavakoli (2004), an economist in Iran, discrimination is the main barrier to fight corruption and is also a cause of corruption in Iran.
13. Lack of strategy and seriousness in fighting corruption: Fighting against corruption that has been announced for some times by top officials during recent years in Iran, and so many plans and committees were established to combat it, lack of seriousness made fighting against corruption ineffective and corrupt activities became more contagious in the country.

### Political Causes

The political causes of corruption are also varied and complex and may be listed as follows:

1. Immature democracy: The Corruption Perception Indexes consistently show that the countries, which appear to be the least corrupt, are all long established democracies. Young and immature democracy in Iran not only is not able to prevent corruption, but also is a cause of corruption. However, the persistence of differing degrees of corruption in established democracies shows that no particular set of political arrangements is a panacea for eliminating corruption. But established democracies usually have an underlying consensus on the values, rules, and processes of political change.
2. Political parties and groups: The legal, but irregular political parties and groups which appear only the time of elections, are one of the sources of corruption in Iran. Such parties and groups are not active regularly and have no control over the activities of the government. If their candidate comes to power, they will be the governmental political parties and abuse the power for own benefit and in the eve of a new election will change the name and will be active again.
3. Lack of a strong civil society in Iran: Johnston (1998) argues that social empowerment is an essential element to preventing corruption. Social empowerment includes the strengthening of groups and interests which make up civil society – that is organizations, enterprises, and informal social networks active in the realm between individuals and government. Where civil society is weak, citizens become vulnerable to exploitation and are unable to construct the coordination mechanisms necessary to police, and where civil society is strong, citizens are able to build coordination mechanisms. Therefore, the strength of mass political participation, specifically the strength of a state's civil society, is the key mechanism for preventing corruption.
4. Lack of free press: The press is owned or controlled by the state in Iran, and will report only information which is acceptable to the state. The press is handicapped, because there is no Freedom of Information law that can secure access to government decision-making processes. Lack of the free press opens multiple opportunities for corruption by officials, politicians, and bureaucrats. Therefore, curbing press freedom is an important means of ensuring that corrupt officials are not held accountable.
5. Lack of transparency in financing and activities of the political parties and groups: There is no obligation for the political parties and groups to declare their financial circles and informing the public opinion about their activities in the community.
6. Giving discretionary power to the political and administrative officials and lack of their accountability to the community.

## Institutions in Charge of Fighting Corruption in Iran

There are several organizations, institutions, and agencies which specially or genially (direct or

indirect) fighting against corruption. Some of them are as follows:

- General Inspection Organization: The General Inspection Organization of Iran (GIO) is linked to the Judiciary of Iran. It is also called the State Inspectorate Organization of Iran. The organization is a member of Asian Ombudsman Association and International Ombudsman Institute. Also, it is the member of International Association of Anti-Corruption Authorities.
- Supreme Audit Court of Iran: The Supreme Audit Court of Iran is a government agency of the Islamic Republic of Iran. It is supervised by the Iranian Parliament.
- Parliamentary Commission for enforcing principle 90 of the constitution which is involved in fighting corruption and enforcing United Nations Convention against Corruption.
- Ministry of Information of Iran also involve in fighting corruption.
- Islamic Revolutionary Guard Corps is one of the institutions that fights against corruption in Iran.
- Ministry of Justice: Ministry of Justice involves in fighting corruption by the Governmental punishment Organization (Sazeman Taazirat Hokomati).
- Islamic Republic of Iran Police (NAJA) also fights against corruption in Iran.

However, the institutions which try to fight against corruption in Iran are not just limited to which mentioned above, but inside public organizations also there are sections like Harasat and Hafazat that have been established to prevent, identify, inspect, control, and prosecute the cases of corruption inside organizations.

## Conclusion

On the basis of above explanations and the definitions of corruption, we can conclude that the public administration and phenomenon of corruption are closed to each other. Then public servants are subject to the corruption.

Literature reveals that corruption is identical with bad public administration under the bad governance. Under bad governance, one has a greater incentives and larger scope for corruption. Bad governance gives higher corruption margin for corruptor because of weak law enforcement, lack of transparency, and ineffective institutional controls. Thus, the promotion of Good Governance helps combat corruption. It goes together with efforts that aim on fighting corruption more directly, such as raising public awareness and strengthening the enforcement of anticorruption legislation.

As evidence shows, the cost of corruption to a nation is very high. It lowers investment, hinders economic growth, and undermines political stability and human development by limiting access to basic social services as well as increasing the cost of their delivery. Corruption also increases poverty, subverts the financial system, endangers the social fabric of the culture, lawlessness, and insecurity, citizens' distrust of the government, undermines the legitimacy of the state and stifles entrepreneurial. Thus, corruption is antipoor, anti-development, antigrowth, anti-investment, anti-entrepreneurship, and inequitable.

Since occasional fighting against corruption in Iran that people have been experiencing for a long time has been ineffective and inefficient, evidences show that corruption is going to be widespread and government's anticorruption efforts have been criticized as being insufficient to stop expanding of corruption at the grassroots level.

# Cost Accounting in Public Services

Francesco Agliata
Second University of Naples, Capua, Italy

## Synonyms

Analytical accounts in public services; Cost system in public services; Management accounting in public services

## Definition

The cost accounting is a financial accounting subset. The cost accounting has the function to support the decision-making process and to inform the management about the resources acquisition and the level of resources utilization. With reference to the public service sector, the cost accounting verifies, for each service, the acquired financial resources, the costs of each productive factor, the obtained qualitative and quantitative results, and the revenues.

## Introduction

In the recent context of the public administration corporatization and of the outsourcing processes for the public services delivery, the awareness that the resources are becoming increasingly scarce and, therefore, that it is necessary to use them in a cost-efficient way, in order to achieve high standards, plays a pivotal role. Using resources in a cost-efficient way means optimizing the obtained results in relation to the inputs used in the economic transformation process.

Moreover, the general absence of the competitive logics within the delivery of public services, as automatic mechanism of market adjustment, allows to recognize a primary position to the management control procedures.

In particular, with specific reference to the public service sector, it is important to highlight that the monitoring was initially understood only in a "bureaucratic" way, viz., as the capability to fulfill the procedural/behavioral obligations related with the regulatory environment. In this way, those aspects which are today of strategic importance, such as the preservation of the financial equilibrium, the managerial efficiency, and effectiveness, were omitted.

In addition, it is wise to note that the presence of external constraints, related to the corporate social responsibility issues, inherent to the public nature of the service provided, is in contrast with the objective of the "sufficient cost coverage" usually adopted by the ordinary activities.

Therefore, there is the need to perceive the changes occurring for private companies, characterized by *for-profit* logics, and to overcome the difficulties associated with the coexistence of public and private interests in the process of the establishment of the strategic goals to achieve.

The information about the performance of the company that delivers the services is very important. Therefore, the various quantitative determinations of business operations methods, which can be used in a multidimensional perspective, have a significant strategic importance. However, some problems in the application of the referred above monitoring systems usually arise, due to four main factors: the presence of a predominantly legal culture instead of an accounting culture, the presence of accounting systems not suitable for economic analysis, the existence of IT systems not able to fully support the management control, and the absence of reliable data caused by the widespread practice consisting in manipulating the financial statements.

## Purposes

The main cost accounting goals are the following:

1. Evaluating the inventories and other assets, in order to allow the financial statements drafting
2. Leading the business decisions, according to the economic convenience criteria
3. Allowing the management control, especially as regards the efficiency, through appropriate comparisons between the incurred costs and the planned costs
4. Providing useful information for the organizational unit performance assessment in order to define the performance-based remuneration to be paid to the managers

The first objective is closely related to the financial statements drafting in compliance with the civil law.

The second and third objects make clearer the cost accounting function in the planning and control process: deciding according to the economic efficiency criteria.

There are two additional functions that are distinctive of the cost accounting and that must be considered as instrumental in relation to the previously mentioned objectives (2) and (3). They concern with the following:

(a) The analytical information about each business unit performance
(b) The measurement of costs related to each product

These latter functions are carried out by the management control staff. In particular, for the public services sector, the control system includes the leading role assumed by the service contract, which rules relationships between the public administration and the contractor company. Within the service contract are defined: the quantitative and qualitative levels of service to be achieved and the cost/revenue and inflows/outflows dynamics, which are fundamental to the determination of the tariff. Moreover, the service chart regulates the relationships between the contractor company and the citizen/user, defining the qualitative levels of service to be provided.

That being said, the different types of control identifiable in the sector are briefly presented below:

- The control performed by the contracting authority on the contractor company. Such control consists of two kinds of action, one external and another internal.

The first has the scope to assess a gap analysis between the delivered services levels and those planned and specified in the service contract. Later on the gap assessment, a specific feedback is addressed by the contracting authority to the contractor company, in order to request the timely implementation of appropriate recovery actions. Moreover, the contracting authority will be in charge to carry out an audit about the financial sustainability of the business taking into account the optimal relationship between the parameters of cost, fare, and quality of the delivered services.

As far as it concerns the internal control, it is aimed to perform, with a feed-forward approach, a gap analysis in order to verify efficiency and effectiveness and also reduce the information asymmetry between the financial accounting and the cost accounting.

- The control of the contracting authority of the service on the user-citizen. It consists of the examination of the adequacy of the fare charged to the users with respect to the service quality perceived by them.
- The internal managerial control on the public utility company's performance trends. This control is aimed at ascertaining the company's ability to ensure over time the economic and financial balance, as well as to detect the all stakeholders' satisfaction level (citizens and investors).

That being said, to use a cost accounting system, dedicated to the processing of quantitative data from the financial accounting which is able to respond to the monitoring of enterprise activities, is necessary. This monitoring function has the

scope to verify the formal correctness of the accounting documents and the adopted operating procedures as well as the optimal resources allocation (Anthony et al. 2005).

## Financial Accounting Versus Cost Accounting

The managerial activities require, in the process of the economic planning, the data processing deriving from the cost configurations. These are made through the financial statement item reclassification. In order to carry out the management control activities, to define a cost center system is necessary. The primary intents are the following:

- Cost center responsible accountability for the resources optimal allocation
- "Make or buy" trade-off related to the noncore activity production
- Setting the fares and/or the prices of final products
- Making analysis on the profitability or cost coverage levels
- Performance analysis comparing it with benchmark data

The financial accounting is mandatory, with an external disclosure function, and has as objectives the determination of the net income, measured as the algebraic sum of costs and revenues in line with the accrual principle, regardless of the time of the financial manifestation and equity, as a result of the algebraic sum of the economic and financial liabilities and assets. The financial accounting makes use of the double-entry method, through which the management events are measured, assigning income and asset items to the several reporting periods.

In a subsequent phase, the cost accounting will be developed. The cost accounting is not obligatory and is designed for gathering information for internal use, with the aim to facilitate the decision-making process. In this regard, paying attention to the cost classification, according to their controllability in the case of alternative management decisions, is very important:

- The costs are divided into relevant and irrelevant; the former are controlled by the head of a particular functional area and are connected to the implemented strategy; the latter have to be sustained regardless of the managerial actions to enact. Regarding the irrelevant costs, the overhead costs, in order to ensure the economic organizational continuity, have to be sustained. They are fundamental to carry out a differential analysis (direct costing) aimed at short-term marginal choices for a better exploitation of the existing organizational structure.

The cost accounting has a greater level of detail than the financial accounting. In fact, the cost items are classified by nature and are structured by destination. They refer to the object of the cost, which has determined the resources consumption, or to the center of responsibility from which it is possible to generate a revenue.

It is wise to note that the cost accounting output serves for the subsequent managerial decisions and trade-off. For this reason, the cost accounting uses the consumptive and standard cost configurations:

- The classification in consumptive and standard constitutes a relevant distinction in the public services management. The consumptive costs related to the production processes are ex post recognized. Such costs are certain and objective and, usually, they are recognized during the financial statement drafting in compliance with the civil law. Vice versa, the standard costs are measured before the production processes and are used in order to make forecasts about the future enterprise performance through the use of statistical methods. Usually, the standard costs are the basis on which the budget is built and represent the measurement, in perspective, of the strategies to implement (Drury 2008).

However, considering the recent public administration corporatization and the public services delivery outsourcing, the standard costs are a constraint and, at the same time, a benchmark for the initial definition of the enterprise strategy. So far the cost/revenue balance was not taken into

account enough. This is because the eventual financial statement deficits were covered by the public administration and were considered as a social cost. In this way, there is the absence of a direct link between the price, representative of the revenue, and the cost, which measures the economic sacrifice to be incurred for the service delivery process implementation. Instead, previously, the links between the quality and the fare, the former as the independent variable and the latter as the dependent variable, and the fact that the cost was not connected in any way with the quality to be achieved and the fare to charge were considered. In this way, it was difficult to pursue a balanced budget and to achieve profit levels that could satisfy the investors' interests. The dynamics between the three variables (fare, quality, cost) that determine the performance seem to be more relevant to the business administration logic, which considers the revenue as a positive income component that covers the costs. In particular, the quality is considered as the starting independent variable from which the level of the cost depends. This latter, in turn, becomes the independent variable from which the value to be attributed to the variable "fare" derives. Therefore, there is a logic of economic efficiency, directed to the profit pursuit.

Regarding to the implementation phase of a cost accounting system, a great awareness of the existing enterprise's organizational structure and activities is necessary to have. This is in order to collect information about the various responsibility centers to which assign the costs. The provided service type and the cost structure, especially with regard to the proportion of fixed/variable costs, have to be taken into account. For example, it is considered appropriate:

- To prefer the standard cost in those firms where the variable costs are high. In this way, when the operating revenues are not sufficient to ensure the economic stability compared to variable costs, a rethinking of the business in terms of service offering portfolio and of the offered service characteristics is appropriate.
- To use differential analysis systems (with the direct costing), considering the gross margin as reference indicator, in those companies where the fixed costs are high, and making any changes in the production structure is not possible.

## Cost Accounting Methods

Regarding the cost accounting methodologies used to measure the full cost level attributable to the different provided service categories, classifying costs on nature and then on destination is necessary.

In order to better understand these methodologies, distinguishing the costs in relation to the way in which they are related to the reference object is considered appropriate:

- The classification by imputation divides the costs in special and common and then divides them into direct and indirect. The division criterion is based on the objectivity of the measurement of the input product partial amount, used in order to produce the output, in relation to the cost object. Therefore, if the input product consumption is ascertained, the cost is special, otherwise the cost is common. In addition, considering the procedures for allocating the cost object, if the criterion of the objectivity is joined by the economic effectiveness criterion, it is possible to distinguish between direct costs and indirect costs. Therefore, it emerges that a common cost is always indirect, while a special cost can be direct or indirect.

The indirect costs, not directly attributable to the single object of cost, are generally divided in proportion to a basis of predefined allocation. In that regard, two alternative calculation methods are identifiable:

1. Cost to be divided * basis referred to the object/total basis of apportionment (attribution rate)
2. Basis referred to the object * cost to be divided/total basis of apportionment (apportionment rate)

Furthermore, it is noted that the division can be made on unique basis, if the total of the indirect

costs is divided in proportion to a single driver, or on multiple basis, if the total of the indirect costs is divided into homogeneous categories, each one related to an apportionment criterion. Among the indirect costs, there are the administrative costs, the social costs, and the amortization costs (Barfield et al. 2003).

Usually the two main used methods are the *cost center accounting approach* and the *activity-based costing (ABC)*.

It is wise to point out that the scope that could be pursued through the adoption of the *cost center accounting* consists in the acknowledge of the several sustained costs in order to produce the desired output and, moreover, in the respective imputation of the indirect costs assessed through the causality relationship.

The main advantage related to such method consists in the possibility to refer homogenous cost classes directly to the corresponding cost centers and the subsequent overturning of the entire amount on the several products, through a unique driver.

The cost center method is usually directly related to a functional organizational unit, to which the corresponding accountability center is strictly connected. The whole of the functional units making part of the enterprise's organization mirrors the requirements underlying the strategy and the management by objective approach adopted by the management.

Usually the following cost center classification is adopted:

- *Productive*. These cost centers are directly connected to the activities that implement the public service delivery process.
- *Auxiliary*. These cost centers are related to the whole of activities that are conducted to support to the delivery process. Among the support activities carried out within a firm's organization, there are the warehouse management, the maintenance services, and the logistics units.
- *Functional*. This category of cost centers is usually related to the activities that, although not directly related to the delivery process, are anyway essential for the organization running.

Once the cost center plan is prepared, the accounting procedure continues with the overturning of the indirect costs to the several cost centers. This operation is carried out according to the consumption request of the underlying resource, expressed by each of the involved cost centers.

Later on this step is the time of the auxiliary costs overturning. Therefore, the same operation, for the functional centers, is optionally executed. Finally, the total amounts have to be allocated to the several products through the *unit rates of cost* calculation.

$$\textit{Unit rates of cost} = \textit{Total costs charged} / \textit{quantity of the production}$$

The formula quoted above allows to measure the amount attributable to each category of product, multiplying the coefficients shown above for the quantity used during the service delivery (Horngren et al. 2002).

It is wise to observe that a rising of the indirect costs related to the production process, especially in the industry sector, can be detected. This trend is due to the implementation of a whole of support activities required by the increasing complexity of the production process. This phenomenon does not depend by the volume production, but rather it is strictly related to the ever-increasing differentiation, decentralization, and flexibility of the production processes. These, in turn, is a decrease of the direct labor costs determined while, at same time, an increase of both the direct raw material costs and the indirect overhead costs generated.

In other words, the "market of the offer," which is peculiar of the mass production and consumption, becomes the "market of the demand." This latter is able to detect and to satisfy the user community's needs. It can be pointed out that the "hidden costs" generated within the production plant, viz., those costs not related to the employment of the production factors, by the management of the ever-increasing complexity of the production structure are caused.

These phenomena heavily affected the organizations involved in the public services delivery. Indeed, these organizations are now required to

focus on a set of specific factors, as for instance, orientation to the users community, total quality approach, innovation process specially using ICT technologies, and production decentralization. Moreover, a high flexibility in the strategy, organization, and production seems necessary. In this scenario, it is wise to point out that the traditional cost accounting methods based on the cost centers that perform the direct costs overturning, calculating it according to the production volume, become obsolete. Indeed, this technique causes a significant information distortion about the trend and the cost distribution.

The cost center accounting approach can also determine the so-called phenomenon of "cross subsidization," in which the unit cost of products connoted by a high complexity of the production process and a low production volume is underestimated. Indeed the costs, due to the complexity, remain "hidden" and "shadowed" by the major absorption of the indirect costs made by the products characterized by a higher production volume.

Indeed, when the distribution of the indirect costs deriving from the complexity is executed according to the traditional methods based on the production volume, the penalization of the mature products was observed. These latter are connoted by a higher volume of production and lower need of cost coverage, while the youngest products are characterized by lower production volume and a higher absorption level of the indirect costs (for instance, the costs for advertising). In others words, the mature products, built up through a standardized production process, are disadvantaged in favor of those characterized by a lower production volume and higher complexity.

The issues above referred legitimated the abandonment of the traditional management by functions in favor of firm's management focused on the interrelationship between the several activities (horizontal perspective). Indeed, the *activity-based costing* (ABC) method is adopted according to the consideration that a direct relation between product and consumed resources does not exist, but, rather, these latter have to be related with the all enacted activities and that contribute, directly or indirectly, to deliver the service that the firm offers to the customers. In other words, it is important to know primarily the implemented activity entity and the total amount of the absorbed factors. This is in order to assess the relevant degree of contribution of the activities themselves to the final output production.

This methodology of allocation of the indirect costs allows to overcome the limits exhibited by the traditional accounting performed by the cost centers. The subtended logic consists in the changing of the perspective adopted for the cost allocation, viz., the coverage of costs, is not primarily related to the production volume, but rather it is linked to the understanding of the resource consumption causes. Therefore, starting from the management by activity analysis is possible to better understand what happens inside the several firms' functions and the related organizational units, and, moreover, the relationships between the functions themselves are possible to assess.

Nevertheless, it is possible to assess that the ABC methodology is not a technique completely different from that of the accounting by cost centers. This is because both methods are based on the overhead cost distribution, but the ABC method is a more sophisticated technique having the scope to assess with greater accuracy the costs of the products, according to the activities related to the indirect costs. Of course, in this case the conceptual model is changed, viz., the cost is correlated with the activities and not with the products anymore. These activities are indirect, consume resources, and are required by the services/customers/markets, and, in turn, they will generate overhead costs.

Therefore, the cost measuring, according to the following phases, will be performed: the definition of the activities and the detection of the relevant costs, the assessing of the criteria to be adopted for the cost allocation, the calculation of the allocation coefficients, and the assignment to the products of the indirect costs. It is wise to point out that deciding the criteria for cost allocation represents the technical innovativeness of the ABC method.

Indeed from one side, to identify a determinant of the cost (activity driver), which should be a full representative of the specific unit, will be required. Through this activity driver, it should be possible to express in a synthetic and effective manner the services delivered by the specific unit. From the other side, it is essential to distinguish the so-called activity rates, relating the total cost of the activity with the activity volume, so that to calculate the unit cost of the activity would be possible.

While the ABC method is limited to the definition of the cost of the activities, the activity-based management *(ABM)* represents the managerial evolution inspired to the operational management oriented to the intervention on the firm's costs. The ABM is grounded on the identification of the activities that primarily contribute to the competitive advantage of the firm, eliminating or reducing to the minimum those activities that do not bring an added value to the business process. When some activities are reduced or eliminated, the related resources should be reallocated, if it is possible (Cooper et al. 1992; Friedman and Lynne 1997).

## Conclusions

All this considering, it can be noted that the cost accounting has its origin in the will to overcome the limits of the financial accounting. Moreover, it constitutes the knowledge base that can serve as reference for the implementation of an effective internal management control, viz., the ways how the several sectors of the firm contribute to the delivery of the public service and to the achievement of the net income.

The cost accounting allows to implement an IT system dedicated to the internal monitoring that offers to the management the possibility to perform a wide variety of investigations and inspections, in order to verify the accomplishment of different objectives, for instance, the choices of the economical convenience about the different ways to deliver the service and the related impacts registered on the effectiveness of the firm; the knowledge about the quantities of resources absorbed by the delivery of each public service; and the comparing of the values of the cost related to a different time period or, vice versa, assessing the positioning of the average cost of the service with specific benchmark values.

It could be said that the cost accounting has the scope to satisfy some informational needs different from those of the financial accounting. Indeed, the cost accounting emerges in order to satisfy the requirements of a specific stakeholder category, viz., the economic agent/managerial category.

Therefore, the strategic value of the information obtainable from the cost accounting is unquestioned. Indeed, while the financial accounting is oriented to satisfy some external stakeholders with a set of information related to the firm performance, vice versa with the cost accounting, to the managerial class, the exact view about the firm performance in a strategic perspective and with the clear objective to highlight the causes of economic nature related to the variations of the results obtained versus those planned is given.

The final phase of the cost accounting procedure is the variation analysis. The latter, in turn, can be divided in four steps: comparison of values, decomposition of the variations, identification of the causes, and definition of the actions to be undertaken. Moreover, it is wise to point out the following:

- The comparison is made between the values referred in the budget and those consumptive to determine the global variations.
- The next step consists in the decomposition of the elementary variations.
- Once the elementary variations are identified, to detect the causes and the related responsibilities is necessary.
- At the end of the procedure, the corrective actions will be defined (Kaplan 1994).

## Synonyms

Cost effectiveness; Cost efficiency; Cost proficiency

## Definitions

### Cost Efficiency

Cost efficiency is the extent to which a primary school's cost is used to achieve the best performance at a given level of input or output under certain business conditions. An efficient school minimizes its operating costs to achieve a given output (Bradrania et al. 2017, p. 194). Cost efficiency measurement values fall into the range between 0 and 1. A smaller number close to 0 suggests that the primary school has greater cost efficiency, while a greater value close to 1 suggests that the primary school is less cost efficient (p. 196).

### Internal Controls

Internal controls are the mechanisms, rules, and procedures implemented by a company to ensure the integrity of financial and accounting information, promote accountability, and prevent fraud.

### Job Motivation

Job motivation is a set of energetic forces that originate both within and beyond an individual's being, to initiate work-related behavior, and to determine its form, direction, intensity, and duration.

### Organizational Resources

Organizational resources refer to all assets available to a firm for use during the production process.

## Introduction

Globally, private primary schools have been identified as an important sector for the economic stability and development of a country (Shabri et al. 2016). Achieving cost efficiency is one of the most important tools for identifying potential areas of cost containment and cost reduction (Assaf and Matawie 2008). However, cost efficiency in schools has been a global challenge for policy makers and scholars. For instance, in some western countries such as Sweden, Finland, the Netherlands, and Slovakia, private schools cannot sustain themselves, with over 90% of school

funding for privately managed schools coming from the government (OECD 2012). In African countries like South Africa, the government is promoting the idea of establishing private primary schools because in public schools, the country is burdened with levels of academic achievement that are on par or even worse than those of other developing countries who spend only a fraction of what South Africa spends on public education (Boateng 2014). Ugandan private primary schools are cost efficient. For instance, Muvawala and Hisali (2012) report that urban private schools are more technically efficient with schools achieving their expected ideal performance rates. This is because the cost of achieving over 50% pass rate at the primary leaving examination level in urban private schools is about US $115.

Cost efficiency in Ugandan schools is an important area of study because of the failure to manage savings for development and growth by some private primary schools. A number of schools have suffered insolvency, while others have stagnated, been sold, and collapsed due to lack of funds. Additionally, it is a norm for many schools to close their academic terms before the official closing date (Oluka 2014; Yunusu 2004). Scholars like Janssen et al. (2008) have advanced several reasons including better inputs for reflection, innovative resolutions, easy decision-making, and feeling of success as better reasons for addressing cost inefficiency of private primary schools using a positive case. Kabojja Junior School is one of the private schools in Uganda that has successfully ensured cost efficiency which has enabled it to grow and develop. Kabojja Junior School started its operations in August 1998 with 15 pupils. The main reason for its starting was to empower Kabojja Junior School to generate savings to support Kabojja Secondary School. Other reasons were to act as a feeder school to Kabojja Secondary School that was already in existence, provide quality primary education, create employment, and act as a retirement benefit scheme for the proprietors as stated by the founder Haji Nasser Lubega who was 63 years old at the time of sharing the information before his death. When Kabojja Junior School started, it employed experienced and competent staff. The head teacher, deputy head teacher, and 14 of the 24 teachers recruited at the beginning are still employed by the school. The school practices prudent financial planning and management including segregation of duties. Different accounting officers manage the finances of the school, but the owner makes the final decision. The school embraces purchase of genuine products in bulk to last for some good time in order to cut costs. Over- and under-stocking of inventories are avoided with procurement officers following the school procurement policy. The user department initiates a request through the supervisor. Three proforma invoices are obtained from possible suppliers, and a procurement committee of four officers decides on the best supplier. Normally, the supplier with the lowest quotation is awarded the contract.

On delivery of the supplies, the storekeeper receives the goods after they have been inspected by the concerned school administrator. This process helps the school to minimize losses. When sourcing items, the school authorities minimize the use of intermediaries to limit overspending on inventories. Expenditure follows the budget, and cash flow planning including infrastructure development is done during holidays. The owner treats the project as he treats his life. He said, "Success is my pride and failure is my misery." The actions taken by the management of Kabojja School have resulted into high staff retention and a high number of pupils currently totalling about 2100 pupils. The school has been able to attract learners from the affluent class of Kampala that has helped it to have stable finances. Thus, the school is able to pay salaries on time including paying staff during holidays unlike other private primary schools. School fees have risen from 500,000 shillings in 1998 to 1.5 million shillings per term to date. Despite the rise in school fees, the pupils' population continued to increase. This increase in population led to the acquisition of more land worth UGX 3.5 billion on which a modern infrastructure to accommodate the increasing population has been built for further expansion. The school is able to give staff advances and staff loans, pay suppliers on time, pay back bank loans, and organize end-of-year

parties for staff. Besides its success, the school went through some challenges given the fact that it started with 15 pupils; the school population did not grow promptly, hence causing the owners to look for alternative sources of funding to sustain the project. Costs like staff salaries, water and sewerage bills, communication, transportation, administration, infrastructure development, advertising, and other school-overhead-related costs remained a liability to the owner. Kabojja management ensures that the school and parents acquire optimum benefit from the available resources. Today, the school is ranked among the first top ten schools in the country in primary leaving examination results and in provision of other facilities. The lessons learned from this story suggest the use of internal controls, building a strong motivated workforce, identifying and encouraging key stakeholders to participate in managing and controlling costs, and the effective and efficient utilization of organizational resources in operating businesses. These lessons call for theoretical explanations.

We utilize the agency theory, stewardship theory, and stakeholder theory to explain the story of Kabojja Junior School. The agency theory (AG) suggests that a principal chooses to contract an agent for reasons of expertise and minimization of agency costs. However, due to lack of information on the side of the principal which the agent possesses, the agent may advance selfish interests making the principal suffer losses. The principal, therefore, uses internal controls to regulate the activities of the agent (Jensen and Meckling 1976). However, the agency theory pays less attention to job motivation factors, specifically achievement motivation, satisfaction with successful performance, and work ethic which were identified as paramount factors in the success of Kabojja Junior School. Thus, this creates the need for another theory that explains how to motivate the agent, hence the stewardship theory. The stewardship theory (ST) holds that there is no conflict between interests of managers and owners and that the goal of governance is, precisely, to find the mechanisms and structure that facilitate the most effective coordination between the two parties (Hernandez 2012). Therefore, managers are not motivated by individual goals but rather are stewards whose motives are aligned with the objectives of their principals (Van Slyke 2006). Stewardship theory indicates that managers are motivated by a range of nonfinancial motives such as the need for achievement and recognition, the intrinsic satisfaction of successful performance, respect for authority, and work ethic (Muth and Donaldson 1998). However, stewardship theory does not point out the importance of stakeholder participation which is key in the Kabojja Junior School success story. This thus calls for analysis of the stakeholder theory.

The stakeholder theory suggests that the goal of any company is its flourishing and its entire principal stakeholder. Therefore, managing for stakeholders involves attention to more than simply maximizing shareholder's wealth but also interests and well-being of those who can assist or hinder the achievement of the organizations' objectives; thus, the job of a manager or entrepreneur is to work on the interests of customers, suppliers, and communities (Freeman 1984). Stakeholder theory advocates for involvement of stakeholders in management of organizations if cost efficiency is to be attained. Overall, the above theories show that each of them explains different predictors of cost efficiency. However, in the story of Kabojja Junior School, organizational resources were identified as a mediating factor in the attainment of its success. Therefore, this gap leads to the adoption of the resource-based view theory to explain the mediating role of organizational resources in achieving cost efficiency.

Resource-based view theory (RBVT) was developed by Bain in 1968 and Porter in 1979 based on the structure conduct-performance paradigm. RBVT explicitly explains the importance of internal sources to achieving sustainable competitive advantage (SCA) and explains why firms in the same industry might differ in performance. However, RBV's principal development occurred between 1984 and the mid-1990s especially with the contribution of Wernerfelt in 1984 and Barney in 1991 (Kraaijenbrink et al. 2010). Resource-based view theory suggests that there can be heterogeneity or firm-level differences among firms that allow some of them to sustain competitive

advantage. The theory emphasizes the firm's resources as the fundamental determinants of competitive advantage and performance (Lockett et al. 2009). Resource-based view theory proposes that the company's abilities to invest are based on its internal capabilities. RBVT considers resources possessed by a firm as the primary determinants of its performance (Lockett et al. 2009). Resources contribute to a sustainable competitive advantage of the firm. In RBVT, a firm is viewed as a collection of tangible and intangible resources that combines with capabilities of management to enable competition with other firms. To provide sustainable competitive advantage, a resource must have four qualities, namely, valuable, rare, inimitable, and non-substitutable (Madhani 2009). Value can be achieved when a resource enables the exploitation of opportunities or neutralization of threats according to SWOT analysis; a resource must be scarce if it is rare, not easily duplicable, i.e., inimitable and non-substitutable, meaning that there are no strategically equivalent substitutes for the same resource. Therefore, resource-based view theory will be the basis for explaining the mediating variable organizational resources in terms of tangible and intangible resources (Mweru and Maina 2016). Therefore, no single theory comprehensively explains how to promote cost efficiency in organizations such as private schools. This calls for the integration of the four theories, namely, agency, stewardship, stakeholder, and resource-based view theories, to help explain cost efficiency in organizations such as private primary schools.

## Literature Review and the Development of the Theoretical/Conceptual Framework

### Agency Theory, Stewardship Theory, and Stakeholder Theory

This paper is grounded on three theories, namely, agency theory, stewardship theory, and stakeholder theory. Regarding the agency theory, this was developed by Alchian and Demsetz (1972), Eisenhardt (1985, 1989), and Jensen and Meckling (1976). The theory suggests that a principal chooses to contract with an agent for reasons of cost and expertise. The principal may decide that their organization lacks the expertise or resources required to produce a good or service and that the cost of hiring or developing that expertise in-house exceeds the costs associated with contracting for the expertise. The principal and the agent agree on the terms of the contract including the inputs, processes, outcomes, quality and satisfaction parameters, monitoring and performance-reporting requirements, how the agent is to be compensated for doing the work of the principal, and the sanctions that will result if the principal detects the agent pursuing his/her own goals above the principal's objectives. The main tenets of agency theory focus on information asymmetry (when one party has information the other party does not possess), adverse selection or pre-contractual opportunism (when one party knows more about attributes of a product or service than another and as a result, the uninformed party runs the risk of purchasing a product or service of low quality), and moral hazard or post-contractual opportunism (when a party to the contract uses information and expertise and acts opportunistically, in its own self-interest, to the exclusion of the agreed-upon contract goals) (Van Slyke 2006).

Two assumptions characterize the principal-agent model: there is goal conflict between the power (bureaucratic) and budget (wealth-maximizing) behavior of the principal and the utility-maximizing behavior of the agent, and agents have more information than principals, which agents can exploit for self-gain rather than for the collective interests of the contracting parties leading to moral hazard problems. However, the weaknesses of this theory are that it is one sided because it negatively characterizes an individual agent's moral and collective behavior as self-seeking and focused on obtaining power and wealth; ignores worker loyalty, pride, and identification with the organization's mission and goals; and omits opportunistic behavior by principals (Van Slyke 2006). However, more significant is that this theory points out that managers of organizations may not act in the interests of other shareholders. This, therefore, calls for

mechanisms such as internal controls to reduce fraudulent intentions of agents. Thus, this theory will be the basis for relating internal controls and cost efficiency.

With respect to stewardship theory, it was developed by Donaldson and Davis in 1991 and 1993 as counterweight to rational action theories of management. This theory holds that there is no conflict between interests of managers and owners and that the goal of governance is, precisely, to find the mechanisms and structure that facilitate the most effective coordination between the two parties. This is because there is no inherent problem of executive control, meaning that organizational managers tend to be benign in their actions (Donaldson 2008). Stewardship theory suggests that managers are not motivated by individual goals but rather are stewards whose motives are aligned with the objectives of their principals (Van Slyke 2006). Stewardship theory recognizes a range of nonfinancial motives for managerial behavior. These include the need for achievement and recognition, the intrinsic satisfaction of successful performance, respect for authority, and work ethic. Managers are viewed as interested in achieving high performance and capable of using a high level of discretion to act for the benefit of shareholders. They are essentially good stewards of corporate assets, loyal to the company. Stewardship theory holds that a manager, when confronted with a course of action seen as personally unrewarding, may comply based on a sense of duty and identification with the organization (Muth and Donaldson 1998). The assumptions of stewardship theory are that long-term contractual relations are developed based on trust, reputation, collective goals, and involvement where alignment is an outcome that results from relational reciprocity (Van Slyke 2006).

Blanket controls applied to all managers may not be the answer to improving corporate performance or safeguarding shareholder interests. Stewardship theory argues that the reallocation of corporate control from owners to professional managers may be a positive development toward managing the complexity of the modern corporation (Muth and Donaldson 1998). However, the weakness of the stewardship theory is that it paints an excessively rosy picture of the steward. Conflicts of interests between the employee and the employer will always occur. The employer will maintain a strong attachment and psychological ownership toward the venture even after ceding a portion of ownership. The employer will remain an owner and will act as one over employees. As such, the employee will not likely subordinate his or her interests to those of the owner. Therefore, interests' alignment will always be a challenge (Arthurs and Busentiz 2003). However, most significant is that this theory suggests job motivational factors that should be put in place in order to make managers want to work in the interests of shareholders, hence promoting cost efficiency. This theory will be the basis for relating job motivational factors and cost efficiency.

With regard to the stakeholder theory, this has its origins in the pioneering work of Igor Ansoff and Robert Steward in 1963 while working for Stanford Research Institute. They suggested that the goal of any company is or should be the flourishing of the company and its entire principal stakeholder. However, Friedman developed the stakeholder theory in 1984 as a framework responding to the concerns of managers confronted with unprecedented levels of environmental turbulence and change (Fontaine et al. 2006). The theory proposes that managing for stakeholders involves attention to more than simply maximizing shareholder's wealth but also interests and well-being of those who can assist or hinder the achievement of the organizations' objectives; thus, the job of a manager or entrepreneur is to work on the interests of customers, suppliers, and communities. Employees and financiers go in the same direction (Sundin et al. 2010). The theory suggests mechanisms for controlling the interests of the agent to enable cost efficiency: these are monitoring, corporate control, contractual relations, and compensation. However, the limitation of the stakeholder theory is that it presupposes that managers do otherwise than maximize shareholder wealth, which violates legal and moral duties. In some ways, it is illegitimate to orient corporate decisions by ethical values that go beyond strategic stakeholder considerations to multi-fiduciary ones (Phillips

2003). However, importantly, the theory advocates for involvement of stakeholders in management of organizations. This theory will be the basis for relating stakeholder participation to cost efficiency.

The theory that will explain the mediating variable (organizational resource) is the resource-based view theory (RBVT). RBVT was developed by Bain in 1968 and Porter in 1979 based on the structure conduct-performance paradigm. Resource-based view theory explicitly explains the importance of internal sources to achieving sustainable competitive advantage (SCA) and explains why firms in the same industry might differ in performance. However, RBVT's principal development occurred between 1984 and the mid-1990s especially with the contribution of Wernerfelt in 1984 and Barney in 1991 (Kraaijenbrink et al. 2010). RBVT explains how an organization can obtain a certain sustainable competitive advantage over time using internal and external resources (Anwar et al. 2018). The theory assumes two assumptions in analyzing sources of competitive advantage: first, that firms within an industry may be varied, and second, that resource heterogeneity may persist over time (Liu et al. 2010). The resources are normally in the form of tangible (physical) and intangible resources. The intangible resources focus on intangible assets including information, knowledge, dynamic capabilities, contracts and partnerships, shared values and beliefs, attitude and behavior, employees recruited, operating and reporting structure, customer service, reputation, product or service reputation. Tangible resources include tangible assets, that is, cash (fee collections), financial capital (bank loans), physical equipment (machinery), inventory, buildings, and land including its location. To achieve the required competitive advantage, organizational resources should possess desired qualities, namely, value, rare, inimitable, and non-substitutable (Mweru and Maina 2016). This is because according to RBVT, organizational resources management are fundamental in increasing profits of an enterprise in the short and long run, hence its cost efficiency.

RBVT indicates that organizational resources must be measured or else performance would be unlimited. Organizational resource identification and management are key especially when focusing on those resources that are valuable, rare, and hard to substitute or non-substitutable (Jumadi and Bakri 2017). Therefore, RBVT suggests that to attain an organization's cost efficiency, efforts should be directed to manage the tangible and intangible resources of the organization in the strategic management of the firm. Thus, RBVT will be the basis for analyzing how intangible and tangible resources mediate the relationship between other factors and cost efficiency in private primary schools.

### Internal Controls and Cost Efficiency

Farhana et al. (2013) defined cost efficiency as how much in terms of costs an organization saves or the act of saving money by making a product or performing an activity. Scale efficiency refers to a situation when the size of the unit of operation is optimal so that any modifications on it will render the unit less efficient. Technical efficiency denotes the ability of the decision of the making unit to acquire maximum output with a given set of inputs. Pure technical efficiency is conceptualized as the measure of managerial performance to organize the inputs in the production process. A combination of scale efficiency and pure technical efficiency will result into overall technical efficiency (Farhana et al. 2013).

Several studies have suggested a link between internal controls and cost efficiency. For instance, Ejoh and Ejom (2014) studied the impact of internal control activities on financial performance of tertiary institutions in Nigeria. The study revealed that there was clear separation of role in the institutions' finance and account department and that superior officers in the college supervised regularly work done by their subordinate. In addition, the study found that the institution financial statements were audited annually by external auditors. However, the results further showed that there was no significant relationship between control activities and financial performance of Cross River State College of Education. Gavrea et al. (2011) studied determinants of organizational

performance on employees of manufacturing firms in Romania. Using the canonical correlation, they established that there was a strong positive relationship between a continuous performance monitoring process and performance. Khademfar et al. (2013) investigated the relationship between ethical work climate and firm performance in Malaysia. Their findings revealed a high correlation and significant relationship between ethical work climate and organizational financial performance.

Makori and Jagongo (2013) analyzed the effect of working capital management on firm's profitability in Kenya. The findings indicated a positive correlation between return on inventory holding period, accounts payment, and a firm's profitability. Mburu et al. (2015) assessed the effect of risk identification management strategy on supply chain performance in manufacturing companies in Kenya. Their descriptive results showed that companies could only ensure adequate cost reduction through the use of activity-based contracts with clean cost management targets and by setting annual savings target and reporting achieved savings monthly, enhancing cost efficiency. Nyakundi et al. (2014) analyzed the effect of internal control systems on the financial performance of small- and medium-scale business enterprises in Kisumu City, Kenya. Their findings showed that adherence to authorization procedures and review and verification of internal controls positively affected financial performance.

Oladejo (2013) examined the impact of management information system on manufacturing firms' decision-making in selected manufacturing firms in Nigeria. Descriptive results revealed that management information system has a significant impact on manufacturing firms' decision-making and profitability. The results revealed that management information system in manufacturing firms helped in taking profitable decisions, maintaining customer-staff relationship, locating potential customers, taking decisions that gave them competitive edge over competitors, and conserving their resources. Patel (2015) in a critical review examined the effect of accounting information systems on the profitability level of organizations. The study revealed that accounting information that is consistent, relevant, understandable, and timely required to meet the needs of decision makers affected profitability of organizations.

Saleem and Abideen (2011) studied risk management and organizational performance in the Pakistani software development sector. Their regression results showed that monitoring significantly positively influenced organizational performance. They indicated that monitoring was the tool, which most organizations used to reduce the threats against them. However, contextual gaps and empirical gaps emerge from the studies above. For example previous studies were conducted in the developed economies paying less attention to the developing countries (Dean 2002; Gavrea et al. 2011) and Asia (e.g., Abu-Tapanjeh 2006; Al-Mamun et al. 2014; Al-Thuneibat et al. 2015; Khademfar et al. 2013; Long 2008; Saleem and Abideen 2011) done in Asia. For those studies carried out in the African context (e.g., Ejoh and Ejom 2014; Makori and Jagongo 2013; Mburu et al. 2015; Nyakundi et al. 2014; Oladejo 2013), none was carried out in Uganda. At the empirical level, whereas the studies by Al-Thuneibat et al. (2015) and Nyakundi et al. (2014) revealed a positive significant relationship between different aspects of internal control and cost efficiency, that of Ejoh and Ejom (2014) did not. From the foregoing discussion, we propose that internal controls and cost efficiency are related (P1).

### Job Motivation Factors and Cost Efficiency

A number of studies (e.g., Abbasi et al. 2011; Crossman and Abou-Zaki 2003; Dizgah et al. 2012; Dobre 2013; Collins et al. 2004; Firestone et al. 2005; Munawaroh et al. 2013; Platis et al. 2015; Yesil et al. 2012) devoted to relating job motivation factors and cost efficiency can be cited. For instance, Abbasi et al. (2011) studied the effects of Islamic work ethic on business performance. Islamic work ethic referred to the state of respect and the practice of good deeds. The results indicated that Islamic work ethic significantly and positively influences business performance of an organization in terms of profitability. Crossman and Abou-Zaki (2003) studied job

satisfaction and employee performance of Lebanese banking staff. The results of the study showed that overall the respondents were satisfied with their jobs. However, as for the relationship between job satisfaction and performance, the results showed no significant relationship. Dizgah et al. (2012) studied relationships between job satisfaction and employee job performance with employees in Guilan Public Sector, Iran, as units of analysis. Their correlational results revealed a positive significant relationship between job satisfaction and in-role performance and job performance. Dobre (2013) carried out a literature review on employee motivation and organizational performance. The study indicated that the need for achievement was a powerful need that influenced the development of effective organizations. Collins et al. (2004) carried out a meta-analysis on the relationship of achievement motivation to entrepreneurial behavior. The study results revealed that achievement motivation was significantly correlated with entrepreneurial performance.

Firestone et al. (2005) studied protestant work ethic and worker productivity in a Mexican brewery. Protestant work ethic referred to employees' self-discipline, hard work, the careful use of time, and personal honesty, among others. Their findings showed that higher protestant work ethic was associated with workplace productivity, hence cost efficiency. Munawaroh et al. (2013) studied factors influencing individual performance in an Indonesian government office. Their regression analysis demonstrated that employee's need for achievement was a significant factor affecting individual performance that led to cost-effectiveness. Platis et al. (2015) studied the relation between job satisfaction and job performance in healthcare services in the National Centre for Public Administration and Local Government in Spain. Their correlational results revealed that self-satisfaction with quantity of work, self-satisfaction with productivity, and self-satisfaction with initiatives significantly positively related to performance, which implies cost efficiency. Yesil et al. (2012) investigated the influence of Islamic work ethic in the workplace. The findings revealed that work ethic influenced firm performance. However, the above studies present empirical gaps. For instance, whereas the study by Crossman and Abou-Zaki (2003) found no significant relationship between satisfactions with job performance, Dizgah et al. (2012) and Platis et al. (2015) found a positive significant relationship. In addition, the studies by Firestone et al. (2005) and Yesil et al. (2012) studied obliquely work ethic as Islamic and protestant work effort. The preceding discussion suggests that there is an association between job motivational factors and cost efficiency (P2).

### Stakeholder Participation and Cost Efficiency

Studies (e.g., Bandeira-de-Mello et al. 2011; Edelenbos and Klijn 2005; Gaspar and Mkasiwa 2014; Gibson et al. 2005; Kessler 2004; Mackie 2008; Nalweyiso et al. 2015; Nasirifard et al. 2013; Riege and Lindsay 2006) have related stakeholder participation and cost efficiency. Bandeira-de-Mello et al. (2011) studied the effects of stakeholder interaction in emerging economies using Brazilian firms. Their results indicated that stakeholder interaction had a positive impact on firm performance. Kessler (2004) carried out a synthesis of literature on stakeholder participation. The findings revealed that consultation leads to increased legitimacy of projects because individuals feel the process is fair and their inputs are used ultimately enhancing their compliance. Edelenbos and Klijn (2005) studied the management of stakeholder participation in decision-making in municipal councils in the Netherlands. The findings of their study revealed that greater input in decision-making from a variety of parties generated a variety of ideas and potentially enriched process substance. Gaspar and Mkasiwa (2014) studied the use of performance information by local government stakeholders in Tanzania. Their interview results revealed that stakeholders' demand for performance promoted efficiency in project implementation. Gibson et al. (2005) carried out a meta-analysis on improving performance and accountability in local government with citizen participation in the USA. The results of the study revealed that stakeholder teams promoted accountability in the use of resources. Mackie (2008) carried out a literature

review on organizational performance management in the Scottish government context. The results indicated that the stakeholder regular feedback affects government organizations' ability to provide quality services.

Nalweyiso et al. (2015) investigated the importance of stakeholder management in improving universal primary education schools in Wakiso District in central Uganda. Their results showed that there was a positive significant relationship between stakeholder management and project success. Nasirifard et al. (2013) studied the correlation between participatory decision-making and organizational effectiveness and performance in mining and trade organizations in Golestan province industry in Iran. Their results showed that a positive significant correlation existed between participatory decision-making and organizational effectiveness. Riege and Lindsay (2006) studied knowledge management in the public sector and stakeholder partnerships in the public policy development in several countries in the Western world such as the USA, Australia, and European Union countries. Their findings revealed that information exchange by different stakeholders improved the quality of decisions. However, the studies above reveal that the studies were largely skewed toward the Western world (Edelenbos and Klijn 2005; Gibson et al. 2005; Mackie 2008; Riege and Lindsay 2006) and Asia (Nasirifard et al. 2013). In addition, the above were carried out in sectors other than private primary schools. We, therefore, conclude that there is an association between stakeholders' participation and cost efficiency (P3).

### Organizational Resources and Cost Efficiency

A number of studies that have related organizational resources and cost efficiency can be cited. Gitahi and Kobonyo (2018) carried out an empirical study on the relationship of organizational resources and performance in companies listed on Nairobi Securities Exchange. Simple linear regression analysis results revealed that organizational resources significantly affect firm performance. The study contributes to theory building by demonstrating empirically that efficient bundling of resources results in firm capabilities that are harder to be imitated by competitors. Hadayati et al. (2016) carried out a study to examine the availability of tangible resources in cooperatives and their influence on firm performance in Malaysia. Regression analysis results indicated that cooperatives are utilizing more of their corporate resources in creating competitive advantage with positive impact on firm performance. In reference to RBV perspective, competitive advantage is generated from within an organization. The organization's resources are its central source of advantage, mainly those resources that are simultaneously valuable, rare, and hard to substitute. Ahmed et al. (2018) carried out a literature review to propose a conceptual framework to demonstrate that organizational factors like strategic orientation, organizational culture, and organizational commitment influence the organizational performance of the banking sector of Pakistan. The findings revealed that these organizational factors can directly and indirectly contribute in enhancing the organizational performance. Kumlu (2014) carried out a survey to establish the effect of intangible resources and competitive strategies on the export performance of small and medium-sized enterprises. A total of 1415 companies were considered from metal, textile, chemical, and furniture industries in Turkey. Regression and correlation analysis results revealed a positive relationship between all intangible resources (IR) and competitive export strategies (CES). It was also found out that IR makes more contribution than CES on perceived export performance. González and Dopico (2017) carried out an empirical study on the importance of intangible assets in achieving competitive and economic advantage. Empirical results indicated that intangible resources like managers' perception contributed greatly on competitive advantage on the entire market. Similarly, this was also supported by financial strength, leadership, and brand image. Shin et al. (2015) examined financial statement data for US manufacturing firms to explore the relationship between inventory management efficiency and firm profitability. Regression results indicated that a firm with lower ratio of inventory to sales is associated with higher profit margins. In addition, small

size firms received larger benefit from increased inventory efficiency compared to medium- and large-sized firms. Shen et al. (2016) investigated efficient and effective inventory management approaches in order to identify key factors that influence inventory management in a Chinese factory. The findings revealed that reducing inventory levels reduces operating costs and increases profitability of an organization. Otero and Amaya (2017) assessed the potential to reduce management inventory costs through the coordinated replenishment of multiple items from non-competitor vendors. The results indicated that companies with limited capacity and high demand achieved a cost reduction in inventory. In addition, companies had less capacity and reduction of holding cost by decreasing the cost of warehouse rental. Hansen et al. (2015) assessed the impact of efficient inventory management in an organization. The findings revealed that bad inventory management practices and damaged goods from storage facilities caused stockouts to hospitals, hence organizational inefficiencies. The literature above shows that scholars made effort to relate organizational resource and cost efficiency. However, gaps emerged at contextual and conceptual levels. At contextual level, all the studies were carried outside the Ugandan context. For instance, the study by Gitahi and K'Obonyo (2018) was carried out in Kenya; the study by Rohana et al. (2014) was carried out in Malaysia; the study by Ahmed et al. (2018) was carried out in Pakistan; the study by Kumlu (2014) was carried out in Turkey; the study by González and Dopico (2017) was carried out in Spain; the study by Otero and Amaya (2017) was carried out in Canada; the study by Ackah et al. (2015) was carried out in Ghana. At conceptual level, cost efficiency was obliquely studied as either organizational performance or financial performance. From the foregoing discussion, job motivation has a mediating effect on the relationship between cost efficiency and its antecedents (P4).

## Development of the Conceptual/ Theoretical Model

As stated earlier, our conceptualization, is grounded in four theories – agency theory (Alchian and Demsetz 1972; Jensen and Meckling

**Cost Efficiency, Fig. 1** Antecedents of cost efficiency

1976; Eisenhardt 1985; Means 1934; Arrow 1971; Muckstadt and Wilson 1968; Ross and Mitnick 1938), stewardship theory (Davis et al. 1997; Muth and Donaldson 1998; Van Slyke 2006; Harnanderz 2010), stakeholder theory (Freeman 1984; Gomes 2006; Branco and Rodriques 2007), and resource-based view theory (Wernefelt 1984) – combines to explain the story of Kabojja Junior School to produce Fig. 1. We also attempt to provide assumptions that trigger the conceptual/theoretical model.

## Assumptions

1. Organizations are conscious of the risks associated with their business operations arising out of their interactions with the various stakeholders and have the ability to develop and implement robust internal control systems.
2. Organizations have authentic and motivated leadership with the capacity to marshal resources required to motivate employees (to pay on time).
3. Organizations develop a cost-conscious culture, develop systems of monitoring costs, and implement appropriate early warning signals for increased costs which are communicated within the organization.
4. Organizations involve and/or engage relevant stakeholders in their business decisions and/or operations.

## Conclusion

In this paper, we set out to develop a theoretical framework that explains cost efficiency of private primary schools using the success story of Kabojja Junior School. The theoretical and empirical review of literature suggests that a multi-theoretical approach combining agency theory, stewardship theory, and stakeholder theory is appropriate in explaining the cost efficiency of private primary schools in Uganda. Kabojja Junior School demonstrates that organizations that are cost efficient pay attention to technical and allocative efficiency, thereby saving organizational resources which promote growth. Cost-efficient schools ensure prudent financial planning, separation of duties, and effective supervision and monitoring. Such schools encourage good working environment and relationship among owners and the staff which results in staff retention. The participation of the school directors in decision-making is common, thereby creating a strong bond between stakeholders. The parents, suppliers, and bankers all have a sense of belongingness and ownership because of recognition, prompt salary payments, and good loan repayments.

# Costs of Ethics

Lisa Kretz
University of Evansville, Evansville, IN, USA

## Synonyms

Consequences of immorality; Results of unethical behavior

## Introduction

Ethical considerations play an important role in the area of public administration and policy. (This chapter uses the terms "ethical" and "moral" interchangeably.) One of the consequences that ethical considerations have in public administration and policy is the creation of additional costs. This chapter explores both monetary and nonmonetary costs that ethical considerations impose in the area of public administration and policy.

To best conceptualize the various ways that ethical considerations impose these costs, this chapter identifies dominant Western ethical views such as utilitarianism, deontology, virtue ethics, feminist ethics, animal ethics, and environmental ethics.

Next it explores ways in which ethical issues arise in public administration and policy. There are a number of methods utilized by organizations to mandate or encourage ethical behavior such as ethical codes, ethical constitutions, standards of conduct, mission statements, and general regulatory policies. Some approaches are procedural, wherein the tendency is to focus on primarily prescribing behavior. Informal ethics might also be used in isolation or in tandem with formal codes. Such ethics tend to pertain to work culture and office dynamics and what is taken to be acceptable and unacceptable. In some circumstances, cues that moral standards have failed to be brought to fruition come from the public. The public often indicates what constitutes the common morality when it responds critically to failures of organizations to achieve this standard. Ethical considerations arise at both the individual and collective level. Encouraging personal individual ethical integrity is one method for bringing to fruition ethical behavior in institutional contexts. Ethics also comes into play in the administration of organizations. Differing models for administration such as the traditional public administration model, the new public management model, and the new public service model each bring their own attendant set of ethical background assumptions and practices. Some organizations engage in ethical endeavors by going beyond existing laws and codes of behavior and engaging in voluntary social responsibility. Attending to the dynamics of employees and their representation also has an ethical valence; consider, for example, the need to reflect diversity, to prohibit sexual harassment, to generate a nonhostile work environment, to avoid conflicts of interest, and to manifest appropriate organizational authority and power. On a broader analysis, public administration and public policies require that responsibilities to citizens are reflected and respected and that actions taken inspire trust.

Following the grounding of various ways in which ethics are practiced in public administration and policy, the chapter next turns to exploration of the monetary costs of actively pursuing ethical standards in public administration and policy. Such costs include those associated with ethical training and management, identifying organizational regulatory and advisory policies, developing ethical codes and mission statements, constructing constitutions and standards of conduct, ethical audits, ethics committees, ethics and compliance officers, systems for resolving ethical

concerns, general infrastructure for monitoring ethical requirements, assessment of compliance with ethical standards via outside organizations or granting bodies, and cultural competence training.

Failure to meet ethical standards carries its own set of monetary costs. The individual ethical failures of an employee can result in the loss of the credibility of an institution as a whole. Scandals can tarnish an entire organization in terms of reputation and can carry attendant financial losses. Ethical failures coming to light can result in lost credibility, lost influence, and lost public trust. In the absence of employee, partner, and citizen trust, the efficacy of public administration and policy suffers. Failure to act ethically may also result in professional certification being lost, legal costs being incurred, and additional penalties. Public sector efficacy relies on evidence of ethical competence; failure through corruption generates citizen distrust and decreases in citizen well-being. Oftentimes individual whistle-blowers call attention to serious ethical breaches by organizations, peers, or management. Evidence of corruption is particularly damaging when it taints the very administration and policy that is meant to protect citizens. Failures of compliance, such as failing to meet mandatory safety procures, can result in firing and criminal prosecution or civil action.

This chapter closes with various nonmonetary costs of ethical failures. A cost-benefit analysis, in isolation, is inadequate to assess the impact of ethical considerations in public administration and policy. On a personal level, ethical failures can result in loss of personal and professional integrity. On an institutional level, ethical failings tend to entrench oppressive systems and externalize costs to disenfranchised populations, including nonhuman members of the ecosystem. Moral failures in public administration and policy can also result in destruction to the social fabric and the sacrifice of individual and group rights to be free from harm.

## Dominant Western Ethical Views

In Western philosophical ethics, numerous ethical systems are employed to assess ethical issues and to propose solutions to ethical problems. Among these ethical systems are:

- *Utilitarian ethics*, which focus on whether general goodness is maximized by the consequences of one's actions. According to this view, every individual impacted by an action ought to be taken into account. Utilitarian thought is often used in cost-benefit analyses. Utilitarian ethics are exemplified by the work of Jeremy Bentham and John Stuart Mill.
- *Deontological ethics*, which focus on whether one's act is motivated by adherence to principles. Moral correctness is defined by actions that embody categorical imperatives, which are, by definition, universalizable. Deontological ethics are exemplified by the work of Immanuel Kant.
- *Virtue ethics*, which focus on whether an individual is habituating the capacity to respond in morally appropriate ways in varied contexts, as determined by a wise person. Virtue ethics are exemplified by the work of Aristotle and David Hume.
- *Feminist ethics*, which focus on the moral harm caused by systemic oppression of various groups and seeks to alleviate that harm through critical social and political analysis and action. Feminist ethics are exemplified by the work of Virginia Held and Susan Sherwin.
- *Animal ethics*, which focus on identifying and ameliorating the immoral treatment of nonhuman animals. Animal ethics argue in favor of moral obligations to nonhuman animals. Animal ethics are exemplified by the work of Peter Singer.
- *Environmental ethics*, which focus on moral harms committed by humans toward the nonhuman environment and its members. Environmental ethics provide arguments as to why anthropogenic harm of the environment is immoral. Environmental ethics are exemplified by Aldo Leopold and Karen Warren.

Each of these ethical systems can offer unique solutions to ethical problems, illuminate inadequacies in other systems, and propose different means of assessing the costs of ethics. It is useful

to keep these ethical systems in mind when identifying and analyzing ethical questions – and when seeking to understand the reasons behind certain courses of action – that arise in the context of public administration and policy.

## Intersections of Ethics and Public Administration and Policy

Ethics intersect with public administration and policy in multiple ways. For example, ethical considerations affect the enactment of laws, the adoption and implementation of formal codes, and the informal expectations of employees. Although the underlying philosophical assumptions (some of which are articulated above) may not be readily apparent, they are nonetheless operative. In addition, ethical assessments occur against the background conditions of the legal system's moral constraints. There are also numerous constraints and recommendations within governmental entities and business organizations, including regulatory policies, mission statements, advisory policies, ethical codes, constitutions, and standards of conduct.

One manner in which to approach ethics in public administration and policy is to focus on procedural matters. Procedural approaches to ethics focus on rules and codes that identify expectations for morally permissible behavior; such an approach is, for the most part, prescriptive. One concern regarding this approach is the potential failure to cultivate robust moral motivation; it can be problematic to do what is morally right simply to avoid punishment as opposed to pursuing morally correct actions as ends in themselves.

Informal ethical codes can be used as alternatives to, or in tandem with, formal codes. Informal ethical codes might arise from office dynamics, the culture of the environment in which one works, and the responses of the public to administration and policy. Such considerations help to shape the unique ethical terrain of any organization. The shape of the more general public ethical landscape is sometimes revealed when organizations fail to fulfill public ethical expectations. What constitutes the common morality of a particular group can be made apparent when there are failures to adhere to it, especially when the failure is accompanied by a public response articulating the concern.

Ethical considerations arise not only at the collective level but also at the individual level. Individuals can manifest principled behavior that evidences quality of ethical character even when that behavior has not been prescribed procedurally. Individuals may face persistently changing contexts and are assumed to be capable of adapting to those contexts in a moral manner when the mere application of inadequately contextualized rules fails to apply. Encouraging the personal moral integrity of employees is sometimes identified as a key indicator of ensuring an ethical organization.

Ethics also impacts the administration of organizations, especially in the adoption of administrative reforms influenced by new administrative philosophies (Maesschalck 2004). For example, traditional public administration can be characterized as having a focus on centralized bureaucracy, top-down control, and minimal discretion (Fox 2001). However, a new public management approach has arisen that emphasizes efficiency and output, recommends contract labor, encourages private-sector management, and focuses on measurable performance standards (Hood 1994). In addition, a new public service approach to public administration has arisen that conceives of service as being in the public interest of citizens (as opposed to customers) and in which there is an emphasis on valuing people and not just productivity (Denhardt and Denhardt 2000). This approach also values citizenship and public service above entrepreneurship (Denhardt and Denhardt 2000). Different foci for the ends of public administration and policy generate a different ethical ethos.

There are also forms of ethics occurring in the context of public administration and policy that go above and beyond those specified above. For example, voluntary philanthropic social responsibility may be expected even though it is not explicitly articulated as an ethical requirement. Such actions can be interpreted as going beyond

compliance with existing laws and codes of behavior. Voluntary social responsibility may involve exercising economic, environmentally responsible, sustainably grounded, philanthropic behavior that is not mandated, but is nonetheless ethically desirable. Philanthropic behavior focused on sustainability concerns can be motivated through environmental ethics. Such action can lead to the benefits that come from a good reputation and the appeal it provides to individuals concerned with supporting socially responsible organizations.

Particular ethical concerns within public administration and policy also arise with regard to employees as members of a work environment. For example, adequate reflection of diverse persons in the work environment is an ethical consideration; diversity includes race, gender, sexual orientation, ability, and class background, among others. Feminist ethics are a uniquely good fit for such considerations. Other ethical considerations within the workplace include harassment – sexual or otherwise – and discrimination. Such occurrences are not only unethical, they can also generate legal action. Similar concerns arise with hostile work environments. Adequate pay, compensation, childcare, and health benefits, among others, also invoke ethical considerations in the workplace. Conflicts of interest also require special ethical attention, both in how they are handled when they occur and in how to prevent them from resurfacing in the future. The nuances of work culture also merit consideration, including the type of leadership provided and how it connects to decision-making processes and organizational authority and power.

Responsibilities to citizens are likewise ethically relevant. Public administration and public policies are only useful insofar as they inspire trust in their constituents. A lack of confidence in organizations radically minimizes their efficacy. The differing moral costs for individuals and larger groups are often brought into relief. For example, moral obligations to the greater whole may take priority (a view preferred by utilitarian-based ethics) or the rights of individuals may take priority (a view preferred by deontological-based ethics).

## Monetary Costs of Actively Pursuing Ethical Standards

Prioritizing ethical concerns within public administration and policy has multiple fiscal impacts. There can be costs associated with additional training for employees and management. There can be costs associated with investing in identifying organizational regulatory and advisory policies, costs that accompany developing ethical codes and mission statements, and costs that are incurred through the construction of constitutions and standards of conduct. Ethical audits, ethics committees, ethics and compliance officers, formal and informal systems for resolving ethical questions and concerns, and more generally ethical infrastructure and the means for monitoring ethical standards, codes, and requirements all come with temporal and fiscal costs. Assessing compliance with ethical standards, codes, and requirements may require the hiring of an outside organization. Additional costs may be incurred due to the need for training for cultural competence if the organization engages in global interactions, so as to avoid culturally relative ethical failures.

## Monetary Costs of Ethical Failures

Inasmuch as it may seem arduous or exorbitant to spend time, energy, and resources on ethical considerations, the benefits may be seen to far outweigh the harms that can result from a failure to invest in an ethical orientation for organizations and their constituents. For example, failures to act in an ethical manner at the individual level can result in the loss of credibility for an institution as a whole. Many instances exist in which the immoral behavior of an individual has, or the immoral behaviors of a group have, created a scandal that tarnishes an entire organization – both financially and in terms of their reputation. If ethical audits reveal wrongdoing, or if ethical failures come to light, organizations can lose credibility, influence, and public trust. Without employee, partner, and citizen trust, the efficacy of public administration and policy will suffer. Furthermore, organizations that operate in

unethical ways may lose professional certification, face penalties, and incur substantial legal costs.

In addition, one could argue that the costs of ethical failures are more dire when immoral action taints the very administration and policy that is intended to serve in a protective role for citizens. Organizations that seek to manifest ethical ideals, such as justice, more generally require aversion to particular forms of injustice like corruption. Ethical competency plays a key role in public sector efficacy, and corruption not only generates distrust but correlates with decreased citizen well-being (Jurkiewicz and Morozov 2012). Oftentimes, harms are exposed by the efforts of courageous whistleblowers, who report serious ethical breaches resulting in significant wrongdoing by organizations, their peers, or their management. Further, when individuals or groups seek to mask failures of compliance, such as violations of mandatory safety procedures, costs can be incurred that are associated with firings and potential criminal prosecutions or civil actions.

## Nonmonetary Costs of Unethical Behavior

By itself, a cost-benefit analysis is inadequate to assess the impact of ethical considerations in public administration and policy, especially if the goal is to live a life of integrity in which doing what is ethically right is valued in and of itself. The failure to do what is ethically correct in a given situation can often result in further harm to groups that are already oppressed (whether that oppression is based on race, gender, sexual orientation, class, ability, etc., or any combination thereof), such as further exclusions, failures to take perspectives into account, and externalizing costs (e.g., to individuals in third-world nations or to the environment), among others. One's own professional and personal integrity may be sacrificed through failures to reflect ethics in the workplace. Regular failures to manifest ethical behavior in public administration and policy can also result in detrimental treatment of the planet, destruction to the social fabric, and the sacrificing of individual and group rights to be free from harm. Accordingly, it is important to assess what nonmonetary costs can arise from the failure to act ethically.

## Conclusion

The impact of ethical considerations on public administration and policy are undeniable, and the costs that they impose cannot be understated. When identifying and assessing the ethical issues that arise in public administration and policy, it is helpful to consider philosophical ethical systems and the influence they might have on behaviors at individual and collective levels. The intersections of ethics and public administration and policy are numerous and varied, and the significant monetary and nonmonetary costs they can impose makes this an area worthy of focus.

# Counterterrorism and Community Resilience

Salwa El Habib
Walden University, Minneapolis, MN, USA

## Synonyms

Community building; Counterterrorism; Deradicalization; Human development; Islam; Islamic fundamentalism; Mediation; Mitigation; Peace building; Radicalization; Sustainable development; Terrorism; Terrorist; Violence; Violent extremism

## Definition

The Federal Bureau of Investigation (FBI) defines terrorism as "the unlawful use of force or violence against persons or property to intimidate or coerce a government, the civilian population, or any segment thereof, in furtherance of political or social objectives." Counterterrorism is the action of standing against, fighting, and preventing terrorism. Resilience is the capacity of the community to recover quickly from hardship.

## Introduction

The phenomenon of terrorism has existed throughout human history, taking different forms of rebellion and manifestations of violence. The origin of the term itself goes back to the Reign of Terror sponsored by France's revolutionary government in the seventeenth century to control its citizens. In more recent history, and through the 1970s, the phenomenon of terrorism involved anticolonial warfare, characterized by nationalistic and liberation movements in Africa, Asia, and the Middle East. During the 1980s, anarchism was on the rise, and so was *Jihad*, following the occupation of Afghanistan (1979–1986) by the former Soviet Union. In response to the Soviet occupation, Afghan tribes formed a coalition of armed fighters trained in camps in adjacent Pakistan. The Kingdom of Saudi Arabia had generously supported the *Mujahideen* (Afghan fighters); and fighters from all over the Islamic world declared holy war against the Soviet Union and flocked to fight alongside the Afghans. The United States intervened with equipment, training, and humanitarian aid to the Afghans and helped them gain independence and defeat the Soviet Union. This was the beginning of overt Jihad by Islamic fundamentalists, which spawned transnational terrorism, transcending political borders, and driven by faith rather than nationalistic interests.

## Background

In 2016, the concept of terrorism had evolved into a full-fledged academic discipline with hundreds of references and several definitions for the term which contextualized the phenomenon as a weapon or proxy war of the weak and disadvantaged against a stronger, more powerful ruler or government. The definitions of terrorism included organizations fighting for defined, tangible causes, such as for independence, or against persecution, injustice, and oppression. Derived from his experience in crises regions around the world, Staub (2000) attributed the formation of terrorist movements to feelings of alienation, ineffectiveness, and insecurity due to political disorganization and economic deprivation. Somalia is a case in point where political chaos and disorganization have alienated scores of people and created a societal vacuum that was favorable for propagation of gang-like violence, piracy, and international terrorism.

## Counterterrorism

The main problem of terrorism is the mobilization and recruitment of streams of supporters, which is fundamental to the sustainability and longevity of a terrorist group. Numerous studies on gang recruitment and socialization draw parallels to contemporary terrorist recruitment and socialization. In order to design effective counterterrorism strategies, it is crucial to understand the process of radicalization, to be able to discern whether radicalization is a function of the recruitment efforts of the terrorist or gang organizations, the vulnerability of the potential recruits, or whether there are extraneous factors that motivate or compel individuals and groups to join in terrorist activities. And if these situations happen interchangeably, what are the driving motives for each? It requires a deeper understanding of the circumstances considered favorable for terrorist organizations and groups to run successful recruitment campaigns. These include relationships, among individuals and groups, and also circumstantial relationships, to identify the triggers that make individuals radicalize and crossover to become active terrorists. This understanding will facilitate a view into the communities and a clearer perception of internal vulnerabilities and sources of resilience.

## Current Research Status

Stump and Dixit (2016) realize that in spite of the rapid growth of research in terrorism and violent extremism, the knowledge generated seems to perpetuate the existing power structures. They claim that most of the knowledge is produced by a relatively small group of researchers in Europe and the United States, crowding out dissident literature and depriving the field of meaningful debate that challenges the assumptions and advances the field. Research on terrorism and violent extremism was also prolific in several countries in the Middle East and North Africa, but due to language barriers, it was not captured in the mainstream literature and media. Similar to dissident research, local and regional research was not recognized in think tank and research institutions and was thus absent from meaningful debates that contributed to policy making. Dissident literature ranged from research revealing characteristics of state-sponsored terrorism, including state violence targeting certain non-state groups and populations, state-sponsored violence across international, or siding with groups and arming them against other groups.

## Paradigm in Literature

There have been three streams of thinking in literature that are loosely connected at the definition level. One stream advocates that conflict is inevitable; the second stream claims that conflict is created to justify aggression; and the third stream is more analytical and pragmatic. The first stream is pioneered by Huntington (1998), predicting the

realignment of the world along lines of civilization, and argued that the principles along which the West evolved are in direct conflict with the principles of other civilizations and cultures, namely, the Islamic, Chino, and Hindu. Huntington predicted that after the end of the Cold War, a clash of civilizations is inevitable between the West and the other cultures. This view was adopted as the premise for the United States foreign policy and continues to be the undertone of the policy and rhetoric of the United States and the Western countries, today, especially post the 9/11 terrorist attack, in the war against terror.

The second stream adopts conspiracy approaches to analysis as in anarchism, the orientalism theory, and the propaganda model. Said (1987) criticized Huntington's (1993) the clash of civilizations viewpoint as being divisive, confrontational, and non-conciliatory and accused him of depicting cultures as homogenous entities that lacked in depth of the human experience, reducing thousands of years of civilization to perceptions of Western travelers and explorers. Said (1993) articulated that Huntington's worldview provides the context for which conflicts are preempted as a justification for aggression. Herman and Chomsky (1988) critically looked at the role of the media propaganda in manipulating the public opinion and how the consent is being manufactured in the public consciousness. These theories have provided material for academic and intellectual debates on foreign policy and continue to feed intellectual discourse today.

Researchers in the third stream attempted to analyze circumstances and motives and are more optimistic about the transiency of the phenomenon as a stage in the continuum of globalization and global terrorism. In his lecture *Nine Myths of Terrorism*, LaFree (2015) described the black swan phenomenon by major events that the media overemphasize by replaying highly dramatic scenes, and raising the level of fear and anxiety, and viewership. LaFree (2015) discussed and refuted the validity of nine popular beliefs on terrorism as myths, using evidence from the Global Terrorism Database (GTD), which is an open-source database including information on terrorist events around the world from 1970 to 2015 and includes more than 150,000 incidents (START).

Other researchers used cause-and-effect theory to analyze terrorism in its contemporary context. At a global level, Azam and Thelen (2010) blamed foreign policy of Western countries on the spread of radicalization and terrorism by militarizing interventions and dumping arms and artilleries into failed or failing states. They suggested that Western countries could reverse the trend by refraining from military intervention in favor of increasing investment in foreign aid. Piazza (2011) blamed minority economic discrimination practices on the proliferation of domestic terrorism. He argued that radicalization and terrorist activities are more prevalent in Western countries where minorities experience economic discrimination. He invited countries to review their policies vis-à-vis their minority populations and develop policies that promote justice and reduce discrimination. Brockhoff et al. (2014) established a reverse relationship between education and terrorism, claiming that the higher the level of education, the less likely individuals would be drawn to radicalization and terrorism. Some researchers were able to draw direct links between public policies and radicalization, as in the case of Nigeria and the rise of Boko Haram, which Suleiman and Karim (2015) attributed to bad governance and corruption.

These arguments constitute some of the general perceptions on why and how people radicalize, yet there is not enough evidence to support or refute any of these arguments and perceptions. Although some of the research findings are plausible, there remains to be a great need for empirical research and data-based evidence to solidify theories and develop viable strategies for counterterrorism.

## Counterterrorism Policies

According to social construction framework (SCF) scholars, problems mostly exist as social

constructs, derived from perceived realities and values and driven by the emotional makeup of the people. Policy makers use selective facts to make decisions about target populations, and the grouping of the target populations based on selective facts influences the policy design. In the case of terrorism, the target populations affect the design of counterterrorism policy, and the policy design affects the target population, a two-way process of influencing and being influenced by the policy design.

Proponents of the multiple stream analysis (MSA) theory find it compatible with the reality of terrorism and radicalization. The MSA may provide the most appropriate platform to understand terrorism and radicalization as complex, with dynamic random interactions, at least as far as the victims' selection appears to be, and constantly evolving. In combination with the SCF platform, a policy window could be created for the formulation of effective counter-radicalization policies and strategies.

Several approaches of critical terrorism studies (CTS) use the historical materialist (HM) approach as a framework for studying violence related to terrorism. Maher and Thompson (2016) established a causal relationship between terroristic violence and neoliberal economics. They use the historical materialist approach as a framework for their research, presenting sequence of events that demonstrate that the domination and displacement of the poor and working class have systematically created economic opportunities for states and international corporations, linking poverty and deprivation to globalization, and thus state terrorism. In using the HM approach, Maher and Thompson (2016) demonstrate the interconnectedness among the political, economic, and security domains in the neoliberal globalization and their relationship to violent terrorism.

Critical of how meaning and identities are produced, critical discourse analysis (CDA) attempts linking the process of meaning production to a wider context of the discourse itself, while highlighting power relations within social reproductions. CDA is a realist approach as it emphasizes a real world beyond our conversational understanding of it. In other words, CDA makes a distinction between actual social relations and our perceptions of those representations, hinting that they could be distorted by power relations in society. As such being critical to the discourse is also a critique of social institutions and practices that produce it. An analysis of the government policy would entail looking at a wider range of documents, applications, and discourse. The analysis may lead to convergence or conflict or different policy interpretation by different departments. These could be supported by analyzing speeches and press releases, from pro- and anti-sources.

## Community Resilience

Resilience prevented the human race from extinction. It is the default for humans, whether public policies ignore or attempt to enhance the resiliency within communities. This is not advocating to leave people to fend for themselves in crises, but to understand that there is always an underlying capacity and strength to build upon. It is critical to identify the sources of community strength to be able to build on them. In a previous section, it was discussed that a deeper understanding of the causes, motives, and relationships behind radicalization and violent extremism is necessary in order to design effective counterterrorism strategies. There are many reasons for individuals and groups to choose violent extremism, and only a few scholars' opinions and findings on the relationship between terrorism and societal malfunctions have been presented. Perhaps community resilience in such cases means appropriately addressing societal lacks and malfunctions to deter terrorism.

## Conclusion

Reiterating what Maher and Thompson (2016) claimed, understanding terrorism takes beyond beliefs, motivations, and good will and that it requires understanding complex socioeconomic relations. The research on the field of terrorism is

far from adequate. It lacks primary and evidence-based empirical data and continues to be skewed toward Western scholars and worldviews. Therefore, research is the backbone of viable, effective counterterrorism strategies that work on eliminating vulnerabilities to radicalization by building on community strength and resilience.

# COVID-19 and Work from Home Arrangement in Hong Kong: Implications and Challenges

Lina Vyas and Nantapong Butakhieo
Department of Asian and Policy Studies, The Education University of Hong Kong, Tai Po, Hong Kong

C

## Synonyms

COVID-19; Flexible workplace; Remote working; Work arrangements; Work from home

## Definitions

Work from home (WFH) is an alternative work arrangement in which employees carry out paid work for an employer in their own homes, rather than in a traditional office.

COVID-19, previously known as "2019 novel coronavirus," is an infectious disease caused by a novel coronavirus, which first emerged in Wuhan, China, in late December 2019.

## Introduction

The year 2020 has been exceptional and unlike any other, especially in terms of work arrangements around the world. A fatal new strain of coronavirus has spread to nearly every corner of the globe, which at the time of writing has already infected more than 59.7 million people globally, with over 1.4 million deaths (Johns Hopkins University and Medicine 2020). The world has shuddered to a halt. The pandemic has a seriously destabilizing effect on societies and economies across the world. The deadly coronavirus, which first emerged in Wuhan, China, in December 2019 (World Health Organization 2020b), is an infectious disease caused by a new virus that can easily spread from person to person. The virus belongs to the same group as the Severe Acute Respiratory

Syndrome (SARS) outbreak in South East Asia in 2002 to 2003 and the Middle East Respiratory Syndrome (MERS) in 2012. In early 2020, the new coronavirus was officially named by the World Health Organization (WHO) as "*COVID-19.*" Respiratory droplets and close contact with infected people are believed to be the main mode of transmission. Common symptoms of COVID-19 include shortness of breath, fever, and a dry cough; however, the symptoms may vary greatly from person to person (Centre for Health Protection [CHP] 2020). At the time of writing, there is no cure for this new virus yet, and healthcare scientists around the world are in a race to develop a vaccine to against it. In light of the urgency of the matter, the WHO is urging people to avoid the "Three Cs," namely, crowded places, close-contact settings, and confined enclosed spaces (World Health Organization 2020d).

This global health crisis is undoubtedly a nightmare for government officials around the world. Governments and health authorities are doing whatever they can to contain the outbreak while minimizing the level of social and economic disruptions caused by the virus. In a matter of weeks, the coronavirus spread from China at an alarming rate to 20 other countries. In view of the deteriorating situation, the World Health Organization (WHO) declared the new coronavirus outbreak a global health emergency on 30 January 2020 (World Health Organization 2020a). Countries in Asia, such as Thailand, Japan, and South Korea, etc., were among the initial batch of countries outside China that reported confirmed coronavirus cases (European Centre for Disease Prevention and Control 2020). Since the start of the pandemic and at the time of writing, there have been as many as 220 countries, areas, or territories affected by the pandemic (World Health Organization 2020c). Governments worldwide are taking various actions to contain the spread of the ongoing coronavirus outbreak, ranging from implementing community-based social distancing measures to rolling out strict national lockdown. Regular routines and habits have been suspended, and so many of the things that we normally take for granted have been put on hold or changed. It has pushed everyone to re-think about the activities in everyday life as well as the working alternatives. The pandemic has led workforces to take alternative working arrangements. Consequently, WFH has been an alternative work arrangement across both public and private sectors during the pandemic in most places worldwide. For instance, in some places such as Hong Kong, the government first introduced special work arrangements for the public sector and then called on private businesses to adopt similar measures (Hong Kong Special Administrative Region Government [HKSAR Government] 2020a).

## Overview of Work from Home

The pandemic has profoundly upended the world of work. Countless businesses worldwide have permanently shut down as a result of the pandemic, while many others are struggling to survive. Small businesses like restaurants and retailers have been among the hardest-hit businesses. Since the beginning of the pandemic, an alternative work model has grown in popularity – hundreds of millions of workplaces around the world have abruptly switched to WFH in an effort to keep their businesses afloat in today's times of crisis. This type of transition can be rather confusing, as for a number of people WFH were considered a "luxury," only very few could enjoy before the coronavirus pandemic. For example, just 4.7% of people in the UK reported working mainly from home in 2019 (Felstead and Reuschke 2020). In fact, the practice of WFH was already in place in the workforce decades ago. It was first introduced by Jack M. Nilles in 1973 (known in other terms like "telecommuting" or "telework"). Consequently, the practice has been defined by several names, that is, e–working, remote work, flexible workplace, and WFH. These terms shared similar concepts regarding employees are able to work in a flexible place, especially at home, instead of work in an office (Gajendran and Harrison 2007; Messenger and Gschwind 2016). Before the pandemic, the idea of WFH was a fantasy to many people, but such practice was considered not practicable for

heavily populated cities like New York, London, and Hong Kong among many others. This is principally because home working requires a quiet and dedicated space to perform work duties, which can be a real challenge for those living in small flats. WFH is becoming a more common practice worldwide as a result of the pandemic, for example, the proportion of people who work mainly at home rose significantly in the UK, which has jumped from 4.7% in 2019 to 43.1% in April 2020 (Felstead and Reuschke 2020). Many individuals and businesses are finding ways to adapt to this new way of working during COVID-19. The pandemic acts as a catalyst to create and promote WFH culture on a global scale; never in human history has such a large number of people been able to WFH globally. Some examples of the expansion of WFH adoption include employees in financial organizations in Europe are allowed to WFH as well as some organizations somewhat supported the costs of WFH practices (Peters et al. 2010). It has also been found that during the pandemic in the USA, some jobs could be performed entirely at homes, such as professional and scientific services, business management, and financial work while some jobs related to agriculture, restaurant, and hotel could be few performed at home (Dingel and Neiman 2020).

WFH has now become the new normal for many of the employees across the world, at least for a while. Some people are enjoying WFH, but for certain people, it is not ideal, and they are longing for a return to the office. The recent WFH trend has certainly sparked a new wave of debate on how effective WFH actually is. Even before the pandemic, there have always been concerns on the pros and cons of WFH. Studies have found the advantages of WFH for both employers and employees; however, some have uncovered the drawbacks. WFH benefits employers and employees, such as less office space using, less absenteeism and turnover, saving time to commute to an office, increasing motivation and productivity, or even job satisfaction. Conversely, some have debated the challenges of WFH, for example, a blurred line between family- and work-life leading to work-family conflict, employees bearing the costs related to WFH, isolation from coworkers, insufficiency of technology such as software and hardware (Mello 2007).

## Work from Home Amidst the COVID-19 in Hong Kong

Many places have been adopting different means to deal and defend themselves against the COVID-19 pandemic, and Hong Kong is no exception. Hong Kong was among one of the first places in the world hit by the disease, where the city announced its first confirmed case of COVID-19 as early as January 2020. The city of Hong Kong is no exception, where the special work arrangements and the government departments have implemented and lifted this work arrangement several times since the pandemic occurred, in accordance with the local epidemic situation. It is the government's initiative to reduce the infection in the city.

### Hong Kong in the Age of the COVID-19 Pandemic

Hong Kong was among one of the first places to report COVID-19 cases outside of mainland China, where the city reported its first case as early as late January. Within eleven months from the day when COVID-19 first appeared, four waves of infections have hit the city, of which the third wave was by far the most serious threat to the city and the forth one still on at the time of writing (HKSAR Government 2020b). The pandemic situation seemed to be handled considerably well during the first and second waves of infection, as evidenced by the small number of infected cases and deaths. However, in early July, the city was affected by the third wave of infection; the number of infected cases in Hong Kong began to spike at an alarming rate. It was found that the number of cases tripled in only one month, reaching 4,736 cases as of 25 August 2020. The situation was on huge concern. The government had adopted more stringent measures to contain the spread like making masks wearing mandatory in all public places and encouraging people to work from home wherever possible.

Unlike many of its global counterparts, the government has implemented a range of initiatives instead of entirely shutting down the city. The government's actions varied from limited public gathering to suspended schooling. One of the priority government measures to deal with the outbreak was the civil servants' special work arrangements. The government also called on private sector companies to enforce similar work arrangements as far as practicable. Not surprisingly, not all companies would follow this call. Some were not in the position because of their nature of work, for example, construction workers, restaurant employees, etc.

At the beginning of the pandemic in Hong Kong, civil servants were among the first batch of employees across the city shifted to WFH; however, necessary public services and emergency work staff were not included. The first batch also included the staff of eight publicly funded universities in Hong Kong. Some private companies in Hong Kong, for example, HSBC, AXA, AIA, and Standard Chartered, also adopted this work arrangement. During the pandemic, the government established specific work arrangements to allow its employees to WFH or work in an office, differing during each wave of the outbreak's severity (HKSAR Government 2020c). More specifically, when the number of infected cases was increasing, the government decided to let the employees shift to WFH; while when the situation was better, the government opted to allow people to go back to the office.

## Work from Home in Hong Kong During the COVID-19 Pandemic

The COVID-19 pandemic has changed the world of work, forcing people to take a new mode of working. It had never happened before that a vast number of the working population switched to WFH at the same time. WFH has never been more prevalent than today. The pandemic also elicited to raise the new discussions on the practicality of such work arrangements as well as the possibility of having WFH routinely in post-pandemic times. In addition to such concerns, the pandemic has brought some private companies in Hong Kong to shift towards WFH permanently, such as 9GAG, a Hong Kong-based social media website online and platform, shifted to WFH forever.

During the pandemic, the workforce in Hong Kong initially seemed favorable with changing the mode of working to WFH. For example, a local survey on employees' WFH experience during the COVID-19 pandemic revealed that most interviewed workers preferred at least partial WFH practices. They hope to WFH 1–2 days a week even after the pandemic. Workers seemed to prefer WFH practices and recognized some benefits of such work mode, for example, flexibility, having more time to rest, and improving work-life balance. However, looking at things in detail, the current WFH arrangement has many challenges. Some challenges of WFH include lack of resources, that is, hardware and software, absence of communication between coworkers, disturbance and distraction from family, limited space at home, limited accessibility of information from an organization, and difficulty in balancing work and family life (JLL 2020; Sun Life 2020; Wong and Cheung 2020). One critical WFH challenge highlighted by many civil servants was difficulty in accessing the information and confidential documents from the government's servers and intranet through virtual private networks (VPNs) while they are working from home. Some struggled to WFH and simultaneously take care of children at home (Tsang 2020).

Moreover, during the COVID-19 pandemic, it has been found that WFH workers in Hong Kong have more stress, burnout, and fear of losing their job than before. This is quite similar to homeworking workers in other Asian countries, that is, India and Singapore where employees also faced more stress during WFH (Teo 2020; Times of India 2020). Owing to a lack of proper policy and regulations in place, the employers as well as the employees struggle to make decisions especially during unanticipated or first-time occurrences. As an example, people in Hong Kong were arguing whether WFH workers should enjoy a day-off or continue to WFH when the typhoon signal number 8 had been alerted the time of WFH in the COVID-19 period. It has traditionally been a practice to require workers to

go home and stop working when this warning signal was alarmed (Ng 2020). However, at this time, the age of the COVID-19 pandemic, people were extensively confused about whether they were permitted to stop working or remain WFH. As evident from controversy, it could be assumed that there is a complete lack of clear official guidance on WFH in the local context for employers and employees adopting WFH, which caused significant confusion among the users.

Nonetheless, it is interesting that WFH, both during the pandemic or postpandemic, will have beneficial as well as negative impacts on employers and employees and is expected to be widely and officially accepted and adopted in Hong Kong. The effect on employers may mostly be concerned about the productivity of employees and organizational performance, while the employees might be considered on whether they will be faced with work-family conflict or work-life balance when embracing WFH. The support from the government is very likely by introducing related policies and regulations that rationalize the working mode. In the future, hybrid models combining WFH and work-from-office will become possible, which will benefit work-life balance. However, there are many intimidations that WFH should be faced with. First of all, the cybersecurity and privacy issues will pose a challenge. In addition, in some cases, employees may have to bear extra expenses for WFH, which may be taken for granted by employers. It is also difficult to effectively arrange WFH if only a part of employees want to WFH.

## Conclusion

The COVID-19 pandemic has reshaped the world of work, affecting the way we carry out certain jobs. As the novel coronavirus continues to spread around the world, many workers have switched from working in an office to home working, in an effort to prevent the spread of the virus in the workplace. Workers in Hong Kong are no exception. Public and private sectors in Hong Kong had sought to find alternative working arrangements. However, not everyone can WFH due to the nature of their work. Generally speaking, quite a number of employees in Hong Kong seem to enjoy the WFH practices; however, there are a number of challenges that need to be addressed in the long term. Some notable examples would be developing clear guidelines and policies on WFH and providing people with appropriate and required training or resources such as the software to support WFH practices. However, WFH in the postpandemic period would be a flexible working option rather than a forced mandate in the foreseeable future, and some sort of hybrid model, with a combination of remote work and office work, will likely become more popular.

# CPA and Global Governance

Awal Hossain Mollah
University of Rajshahi, Rajshahi, Bangladesh

## Synonyms

Comparative governance studies, multinational governance; Comparative policy and administration studies; Comparative public governance; Comparative public management; Comparative study of global public administration; World governance

## Definitions

The study of **comparative public administration (CPA)** is the way to explore the capacity of government and public actors in designing and implementing policies, programs, and projects throughout the world. "Comparative public administration is an approach to research and development of public administrative attributes and capacity in performing its responsibilities in different political, social, and economic systems" (Jreisat 2016: 1).

**Global governance** is a process by which multinational actors and institutions work together to solve global problems by using transnational strategies with a view to ensuring the well-being of human society and global development.

## Introduction

This study aims to highlight the necessity of comparative public administration (CPA) in ensuring better global governance. It emphasizes the necessity to learn more about how administrative reforms work effectively to ensure better management and governance of the public sector in different cultural contexts (Fitzpatrick et al. 2011: 821). However, the study of CPA is not an easy task but rather full of challenges. Global governance can be compared to and measured by the different issues related to public administration by using the approaches of comparative public administration. For instance, accountability, rule of law, control of corruption, impartiality, professionalization, and effectiveness in fulfilling the society's principal goals contribute to an understanding of the performance of the government sought by the researchers.

Primary studies on administration in countries such as China, Thailand, Vietnam, Turkey, Egypt, Pakistan, Brazil, and others disseminated knowledge, enriched practices, and expanded the horizon of public administration to become a global field of theory and practice. Eventually, comparative public administration research enhanced the global knowledge of the vital processes of reforming governance (Jreisat 2016: 1). The comparative approach is necessary to solve the various problems of governance that cannot be (re)solved via domestic policies. Examples of such global phenomena include climate change and global warming, migration, human (sex) trafficking, the garbage patches in the world's oceans, cybercrime, terrorism, drug trade, the extinction of species, epidemics, and the effects of an increasingly international economy where multinational corporations are difficult to constrain (Raadschelders 2018: 1). Therefore, a comparative study is important because the comparison is, first and foremost, a method of research. Moreover, adopting a comparative perspective, it assimilates experiences and cases across countries and regions in making a significant contribution to constructing a global social science (Gulrajani and Moloney 2012, cited in Wong 2016: 1). However, at the current stage of its development, there is still a gap between what it can deliver and what it has accomplished. The main objective of this paper is to help bridge that gap by introducing comparative administration and discussing critically the challenges and opportunities it is facing.

## CPA and Global Governance

The study of comparative public administration is very important in the digital era of globalization. CPA mainly spotlights on a specific policy area and then discovers by comparing among a group of countries, state of governance, or successive periods over time. But, comparative studies do not often take the larger political-administrative and societal context into account within which these policies unfold. So, before addressing these theoretical, conceptual, and methodological challenges, we need to gauge the nature of our time about trends in and around the state (Raadschelders 2018: 8). Pollitt (2011) suggests that with technological advancement and the extensive use of the English language, comparative public administration researchers do not have much problem in accessing information. As a result of the dramatic changes in communication and information technology, there are more opportunities for comparative public administration. Jreisat (2011) asserts that the advanced tools of communication and information technology make cross-cultural studies more manageable and easier. He emphasized that globalization requires comparative public administration and new administrative knowledge and skills.

This study focused on the importance of comparative public administration (CPA) for better global governance, which will provide a broader framework for comparison across nations of the world. The ultimate purpose of public administration is to improve governance in the sense of

efficiency and effectiveness in providing government services. It focuses on competition, measurement of results, and outputs; networks and new public governance (NPG), with emphasis on collaboration and effectiveness; and a move from outputs to outcomes among other things. These movements also resulted in a shift from public administration as a practice and discipline to public management, which is more applied and practical for rival arguments (Adebayo 2018).

The study of public administration from a comparative perspective is imperative for a variety of reasons.

**First,** the understanding of global issues requires a grasp of comparative public administration. An understanding of the global public administration is important to the extent that we strive to ensure security, peace, and livelihoods in an increasingly interconnected world (Gulrajani and Moloney 2012: 79). Similarly, Farazmand (1999) mentioned that comparative public administration broadens our world outlook and the American scholars and students can benefit from an understanding of cultural, institutional and religious underpinnings of administrative cultures.

**Second**, any attempt at building a scientific theory of public administration requires a comparative study of public administration. A study on comparative public administration focused on similarities and differences in different countries can build theories that are applicable across nations. In an interdependent global world, the issues of public administration cannot be understood without international collaboration. No country in the world can afford to live in complete isolation. To promote theory building in public administration, we need to examine issues across national and ethnic-demographic divisions to better understand and explain context-specific phenomena. To ensure Public Administration's relevance to practice, we must reach out to the global public administration community in academic exchanges, global innovation and diffusion of best practices, and collaborative education. Despite the influences of specific domestic factors in public administration, comparative public administration can contribute to building theories that can be applied cross-nationally.

**Third**, comparative public administration helps in eliminating the parochialism of public administration with a focus on both the Western and non-Western world. Jreisat (2011) suggests greater collaboration between the global North and the South through comparative public administration. Globalization provides an opportunity to conduct comparative research that is meaningful and useful for managers in all nations regardless of economic, political, and social considerations. A comparative approach can counter the tendencies toward parochialism that was prevalent in US public administration theory, research, and teaching (Klinger and Washington 2000). The comparative study helps to move away from an ethnocentric, parochial view of public administration based on the United States and Western Europe and broadens the search for theories of solving problems by including the context and cultural factors influencing public administration (Heady 2001; Pollitt 2011; Riggs 1976; Sigelman 1976).

**Fourth**, comparative public administration is useful for practical solutions to common problems. At present, governments are facing the common problems of the economy, education, terrorism, health care, and the environment. Comparative public administration can help find solutions to these complex problems by learning from other countries. It can help understand the different contexts of public administration. An analysis of the different contexts will be helpful to propose the best solution to the administrative problem in a given situation. An international and comparative perspective enhances our understanding of the impact of contextual variables on public policy and administration (Riggs 1968). The contextual factors are important for understanding the important variables relevant to public administration.

**Fifth**, the latest innovations in governance are essential to know and apply in developing and underdeveloped countries so that they can solve their problems. For instance, the microcredit program of Grameen Bank and BRAC is one of the revolutionary approaches in poverty elevation (Bangladeshi approach), which has been accepted and applied throughout the world, especially in Asian and African countries. It also means

comparing public policy and administration is essentially a comparison of the impacts of institutions (Heidenheimer et al. 1990). Consequently, from a broader perspective, the state of comparative public administration and policy studies is always a major indicator of the degree of success of social science scholars in pulling their knowledge together for making an impactful and discernable contribution to society (Wilson 2016).

Utilizing cross-national data from the Quality of Government Institute Expert Survey and Global Innovation Index, findings show that levels of innovation outputs are significantly higher in countries that have higher levels of professional and impartial bureaucracies (Kohei and Mehmet 2017). The results suggest the importance of administrative designs to promote innovative activities.

So, a comparative study of public administration is indispensable for global governance and peacekeeping.

## Challenges and Prospects of CPA for Global Governance

Despite its advantages, comparative public administration has not regained its prominence (Heady 2001; Klinger 2004). Earlier attempts at comparative public administration suffer from some problems and challenges but have some prospects too which have been discussed below.

**First,** the researchers faced the problem of establishing common criteria for comparing different nations with varying contextual variables affecting public administration. The problem of functionally equivalent indicators of important concepts is a challenge for comparative politics and administration. How to find a functionally equivalent indicator measuring the same phenomenon across the nations of the world was a challenge for the earlier researchers of comparative politics and administration. However, with the improvement of communication and technology and universal acceptance of common language, there are functionally equivalent concepts. The rise of social media has facilitated the emergence of common vocabulary across the world. The users of social media even use common acronyms to express their views on issues faced by the world. The use of the common concepts across different countries of the world has facilitated research on comparative public administration.

**Second**, the lack of broad-based data on public administration hinders research on a comparative study. However, the collection of data by the international organizations the World Bank, United Nations, OECD, Transparency International, and others have made it available for the researchers to research common issues. Gulrajani and Moloney (2012) expressed their concerns about the challenge of robust data from developing countries.

The authors suggested developing broad-based data for comparison so that the monopoly of the World Bank and other international organizations can be broken. Despite the existence of data by the different international organizations, public administration lags behind political science and other social sciences in the availability of data. Public administration researchers can devote more time to developing data that can be used cross-nationally. In addition to the above problems, the field of comparative public administration faces other challenges

**Third**, there are insufficient answers to the different complex problems faced by the governments of the world. Comparative public administration fails to explain why two separate countries under a similar situation behave differently. Jreisat (2011) asserts that the current research ideology and practices employed in comparative public administration are as yet inadequate in addressing these types of questions. So, many researchers are emphasizing the inclusions of not only institutions but also the contexts and the environment relating to public administration (Hood 2011; Terman 2011).

**Fourth**, one of the major problems of comparative public administration is parochialism/ethnocentrism based on American and Western public administration. The majority of the articles in major public administration journals concentrate on American and Western European countries.

As Heady (1987: 480) noted a quarter-century after the emergence of comparative administration, "parochialism is a persistent dominant

feature of American public administration, evidenced in the curricula of institutions of higher education and the conduct of public administration by practicing professionals." Parochialism based on western public administration impedes the comprehension of comparative and global perspectives of policy issues, and at the same time, it is a failure to use the knowledge from other countries to the advantage for the United States (Jreisat 2011).

Comparative research can help in understanding some particular patterns or generalizable laws influencing administrative issues across nation-states (Riggs 1962; Terman 2011). However, the thrust of comparative research is on a country-specific case study (Jreisat 2011). The case study is necessary for understanding the administrative systems of a particular country. However, case studies do not lead to broad-based theories in public administration. So, parochialism in public administration stands in the way of building grand theories applicable to the world.

Riggs (1991: 473) mentions, "We can no longer afford to base our theories on the truly exceptional American experience and to limit "Comparative Public Administration" to the study of "foreign" governments. Public Administration must be comparative in a global world system, we need to develop frameworks and theories for the study of public administration that are truly universal in scope-they will be based on a comprehensive ecological understanding of the place of public administration in all governments, historical as well as contemporary."

Yang (2009) complained that the international students in public administration programs were discouraged to concentrate on comparative public administration if they want jobs in the United States. There was not enough priority on the topics of comparative public administration in major journals despite the promise of the Public Administration Review that there would be international coverage regularly and "file periodic regional reports on best practices that apply to American public administration" (Stillman and Raadschelders 2006: 3).

Still, most of those articles focus on applying American administrative theories in a particular foreign country, with very few focusing on more than one country lacking an attempt to compare and investigate the influence of cultures and institutions (Yang 2009).

Fitzpatrick et al. (2011: 827) were concerned about the lack of emphasis on the countries of Africa and South America, the regions that will not meet the United Nation's Millennium Development Goals by 2015. They emphasized the importance of comparative public administration because it would enable a better understanding of the performance of the government in critical services like health care, sanitation, economic development and education in different regions of the world.

**Fifth**, **comparative** public administration was marked by shifting focuses lacking an attempt to build grand theories. One of the earliest attempts at comparative public administration was by Fred W. Riggs (1964), who developed three models: prismatic, fused, and diffracted types to study the administrative system in different countries. On the other hand, Samuel Katz (1970) advocated system approach to public administration. But the concept of the system includes too many variables, making it difficult for any systematic comparison across nations (Khan 1990). The other researchers on comparative public administration focused on bureaucracy (Aberbach et al. 1981; Heady 1966) and broad systems such as civil service and personnel management (Wart and Cayer 1990). Many researchers emphasize the importance of cultural contexts of different countries in understanding comparative public administrations (Przeworski and Teune 1970; Riggs 1962, 1991). However, it is difficult to collect data on culture in a comparative fashion. But ignoring the cultural norms, values, and traditions may cause the problems of validity and reliability in research. Riggs (1991) focused on presidential to make a comparison with the non-presidential system. Without measurable empirical data, it is difficult to make a comparison. However, with globalization, we have more opportunities for comparison between the administrative systems in presidential and non-presidential systems. It will be interesting to explore whether the presidential system performs better in terms of delivery

of services in health care, education, and economic development compared to the non-presidential system.

On the other hand, Ferrel Heady (2001: 391) focused on New Public Management (NPM) as "representing the most recent urge to develop a science of administration with principles of universal validity." Despite its appeal for universal acceptance, NPM was mainly limited to the United States and Western Europe. However, NPM is a concept too broad to guide a cross-country comparison (Dahlstrom and Lapuente 2010: 578).

**Sixth**, the other issue focused by comparative public administration researchers is culture. Many consider the understanding of the cultural contexts when comparing the implementation of policies in different countries (Przeworski and Teune 1970; Riggs 1962, 1991). However, it is difficult to gain knowledge of cultural values, norms, and traditions. Fred Riggs has "consistently put a particular emphasis on the linkage between public administration and its environment, and therefore advocated the concept that the administrative behavior in a given society must be understood in the context of the social background instead of the administration itself. Given that the administrative culture is only a subculture of the general social system, public administration can only be understood from the aspects of the ecological background which creates such an administration" (Wen-Shien and Peng 2008: 528). One of the major works on the importance of culture to the understanding of public administration is *Administrative Culture in a Global Context* by Joseph and Dwivedi (2004). Jabbra and Dwivedi (2005: 20) define administrative culture as "the modal patterns of values, beliefs, attitudes, and predispositions that characterize and identify any given administrative system." However, the study of culture most often focuses on a particular country without taking into account cross-cultural differences. "The lack of attention to culture may emerge from the many researchers who conduct comparative studies, but, may not be familiar with comparative theories or methodologies" (Fitzpatrick et al. 2011: 826–827). Nevertheless, focusing on cultural variables may be problematic from the point of building theories that can be applied universally. So, the classic dilemma of generalizability versus reliability predominates the research on comparative public administration. Hofstede (2001) identified five different dimensions of world culture: power distance, individualism/collectivism, masculinity/femininity, uncertainty avoidance, and long-term/short-term orientation. However, research needs to focus on the impact of culture on public administration.

**Seventh**, comparative public administration research can take advantage of the new realities and opportunities of the world. Robert Dahl mentioned nearly 70 years ago that "the study of public administration inevitably must become a much more broadly based discipline, resting not on a narrowly defined knowledge of techniques and processes, but rather extending to the varying historical, sociological, economic and other conditioning factors that give public administration its peculiar stamp in each country" (1947: 11). Holzer and Kasymova (2012: 162) assert that although comparative public administration (CPA) may have lost "the momentum of the 1960s and 1970s," the promise of significant cross-national studies is reemerging. Despite the emphasis on the topics of networks and governance, few articles are addressing these issues (Fitzpatrick et al. 2011). They believe that comparative perspectives should be incorporated into all topics of public administration. Werlin (2003) illustrates how more creative sampling strategies (e.g., countries similar in size and geography but dissimilar in governance) can expand comparative research to a more diverse set of countries and, in his research, develop the theory to show how governance structure helps explain differences in the wealth of nations. In an era of globalization and internationalization, there is a need to obtain general knowledge that explains similarities among countries, such as in centralization and decentralization, patterns of governing and policymaking, degree of professionalization, and managerial practices (Jun 2000).

Jody Fitzpatrick et al. (2011) note that globalization and the search for effective administrative reforms in different cultural contexts require public administration to incorporate a comparative

perspective. They emphasized the necessity for public administration to address the policy implementation challenges that the government faces in a globalized world. Similarly, Jreisat (2011) asserts that the countries in all regions of the world are looking for ways to improve the delivery of the services. The new realities of the world influenced many researchers to focus on governance. A comparative public administration perspective has changed the practice of public administration by directing it toward good governance. A search for better administration of government services has been the focus of the researchers on public administration. Comparative public administration theorists can focus on the ways to improve the quality and effectiveness of the government across nations.

**Eighth**, the central purpose of public administration is to improve the quality of governance. The quality of governance involves the processes and performance of the public administrators in delivering the services of the government. Globalization has facilitated the access and exchange of information all over the world. Globalization requires inclusive international collaboration for investigating any administration, developing country, or otherwise (Farazmand 1996, 1999). The paradigm based on the quality of governance is significant from the point of its applicability across the world.

The quality of governance involves both the internal organizations, the processes, and at the same time the effectiveness in the performance of the necessary functions of the government. The quality of governance can be assessed by the available data based on the functioning of the government, rule of law, basic administration, and the impartiality of public administration and professionalization (Yu Keping 2018: 1–8).

**Ninth**, the performance of the government is a variable that measures the extent of the ability of the elected head of the government, and the national legislature determines the policies of the country. It measures whether the government is accountable, free from corruption, transparent, and open. Accountability measures the extent of citizens' participation in an election to select their government. Carmen and McNeil (2010) consider accountability as the pillar of good governance. Without accountability, the goals of social justice, human development, and overall development are not achievable.

To ensure accountability, it is necessary to have a transparent and open government, where people have the rights of free speech, expression, religion, and the press. It is imperative to protect the rights of minorities, and minority views are not respected. An educated and informed public is essential to have an accountable and open government. Farazmand (1996) mentions that with democratization and the rising expectations in the developing world, the people are demanding more human rights and are resisting repression. The people are also becoming more aware of the activities of the government as a result of the international media, which is instrumental in exposing government corruption.

Corruption is one of the major impediments to economic development. Corruption is measured by the prevalence of bribes and other mechanisms for private gain. Corruption reduces economic growth by reducing private investment (Mauro 1995; Burki and Perry 1998). Mauro (1995) claims that corruption inundates the poor countries, for example, Zaire, Indonesia, and Haiti, whereas the rich countries like Switzerland, Canada, and the United States have less corruption. One of the other forms of corruption is the existence of clientelism and patrimonialism. Despite democratization, economic liberalization, and civil service reforms, many developing countries suffer from clientelism and patrimonialism. Brinkerhoff and Goldsmith (2004: 163) assert that "clientelism and patrimonialism are inefficient for society because they reduce expenditures on true public goods, which, in turn, are essential for sustained economic growth and social advancement." One of the major impediments to an effective, impersonal and rule-making state is patrimonialism, and any country that overcomes it can establish administrative capacity and an effective system of accountability.

Corruption is one of the major topics of public administration theorists because it is a major

impediment to development and administration. By comparing the nations on corruption, a more generalized theory can be established.

**Tenth**, rule of law, which, measures the independence of the judiciary, the extent to which rule of law prevails in civil and criminal matters; the existence of direct civilian control of the police, the protection from political terror, unjustified imprisonment, exile and torture; absence of war and insurgencies, and the extent to which laws, policies, and practices guarantee equal treatment of various segments of the population. The rule of law reflects the level of confidence in the rules of society and enforcement of the law by the appropriate authorities. Rule of law involves the efforts of the government in preventing crime and violence. It shows the propensity of the public to obey contracts and agreements. The traditional function of public administration is the enforcement of the law. The rule of law shows respect.

**Eleventh**, the fair play of public administration is essential for the exercise of the power of government impartially. The lack of impartiality corrupts public administration distorting the public interest benefiting the ruling clique. Impartial administration is essential for maintaining justice and the rule of law enforcing equality and fairness. Impartial public administration is necessary for establishing trust and legitimacy in the government. The selective enforcement of administration threatens the confidence of the people in the government. Woodrow Wilson proposed the separation of politics and administration to establish an impartial administration. The availability of data on impartial administration can help in comparing nations contributing to an understanding of an important element of public administration emphasized by the classical administrative theories.

Impartiality in public administration measures the degree of its independence from political pressures. Impartiality determines the quality and commitment of the government in policy formulation and implementation.

**Finally,** the professionalization of public administration requires recruitment and promotion to be based on merit principles. The merit principles are based on knowledge, skill, and ability. Professional civil service has been advocated by Max Weber a long time ago to promote efficiency in public administration. Despite the emphasis on professionalization, many countries of the world still manipulate recruitment and promotion of the civil servants. Based on the data on the quality of the government, countries can be compared to the professionalization of public administration.

The availability of large data based on the quality of government eliminates the traditional problems of comparative public administration: the lack of access, language barriers, lack of data, and the problem of establishing functionally equivalent indicators. The quality of government indicators is based on functionally equivalent indicators across the nations of the world. Each of the indicators is vitally related to public administration.

The quality of government can be evaluated based on the effectiveness of the society's goals at the prevailing time. For example, at present, there are more demands to ensure human development, remove inequality in income and gender, prevent terrorism, and ensure environmental sustainability. Gulrajani and Moloney (2012) emphasized the importance of research especially in the developing countries on examining the public service delivery and investigating the politics–administration dichotomy, human rights, and protection of health and environment. The quality of government can be judged by the success in meeting these objectives desired by society. With the available data, countries can be compared based on the performance in achieving these goals. The success of public administration depends on meeting or improving the important aspects demanded by the people.

The researchers can concentrate on one of the topics for cross-national comparison. The availability of broad data on each of the topics enables the researchers to research nations. Researchers on comparative public administration can use the data on one of the important aspects of government and make a comparison among the countries.

## Conclusion

The CPA study has a great impact on global governance. The literature on the quality of governance provides information on the internal dynamics of public administration across the world. The literature on professionalism, impartiality, functioning, rule of law, and basic administration provides necessary criteria for comparison. At the same time, data on the quality of government can be measured by the performance in different issues.

Global governance can be compared to the different issues related to public administration by using the strategy of comparative public administration. For instance, the effects of the functioning of the government based on accountability, rule of law, control of corruption, impartiality, professionalization, and effectiveness in fulfilling the society's principal goals contribute to an understanding of the performance of the government sought by the researchers. These issues are important for researchers, policy analysts, government agencies, and international organizations. The quality of governance data is necessary for comparative public administration because they are comprehensive and broad-based, applicable for cross-national comparison.

# Creative Accounting

Salme Näsi
School of Management, University of Tampere, Tampere, Finland

## Synonyms

Account manipulation; Cosmetic accounting; Earnings management; Financial engineering; Income smoothing; Managing reported financial information; Off-balance sheet financing; Window dressing

## Definition

A process of manipulating the accounting figures of an entity in order to mislead rather than help the intended users of the information.

## Introduction

The term "creative accounting" seems to have appeared in the accounting literature in the 1950s (see, e.g., Park 1958; Bows 1959). At that time, however, the term seems to have referred to a positive creativity and the responsibility of accountants to find the best possible ways to earn a return on investments. Bows (1959, p. 51) states: "Accounting can contribute to larger profits by creative analysis of costs and use of funds, by evaluating the profitability of the various segments of any business enterprise. . .." Accountants

were seen as "continuous, creative, dynamic aid to management" (Park 1958, p. 444; see also Carey 1956).

A synonym of the adjective "creative" is "innovative" – both are adjectives that usually have a very positive connotation. In the context of accounting, creative accounting today has a negative implication. Besides creative accounting, several other concepts or terms, such as "earnings management," "income smoothing," "financial engineering," "cosmetic accounting," "window dressing," "account manipulation," "managing reported financial information," and "off-balance sheet financing," are used to describe more or less the same phenomenon (see also Diana and Madalina 2007; Balaciu et al. 2009). Some of these terms refer to lawfully acceptable but ethically questionable actions. Most of the terms, however, clearly reveal that there is some element of deception or fraud. Creative accounting can be understood as an umbrella concept for all the terms and forms of manipulation of accounts referring to the misleading, false, or dishonest presentation of financial information. Creative accounting practices are possible due to flexible or missing accounting regulations, but first and foremost such practices are an ethical issue. In this chapter, the use, motives, and means of creative accounting are discussed in the contexts of both the business and public sector.

## Creative Accounting in the Business Sector

Creative accounting as a concept is mostly used in European accounting literature, while the preferred term in the United States – and consequently in most of the literature on the subject – is "earnings management" (Amat and Gowthorpe 2004). Creative accounting is defined as "the *use of accounting to mislead rather than help the intended user*, deliberately taking advantage of areas where there is no standard treatment or where there are ambiguities and discontinuities or arbitrary cut-off points" (Parker 1984, p. 76; see also Amat and Gowthorpe 2004). Healy and Wahlen (1999, p. 368) explain that "Earnings management occurs when managers use judgment in financial reporting and in structuring transactions to alter financial reports to either mislead some stakeholders about the underlying economic performance of the company or to influence contractual outcomes that depend on reported accounting numbers."

Earlier literature on accounting ethics and creative accounting from the 1980s and 1990s mostly concerned accounting in the business context. The valuation of fixed assets has always played an important role in creating opportunities for creative accounting: regulatory flexibility may permit a choice of policy in fixed asset valuation at either revaluated amounts or a depreciated historical cost. The problem related to fixed asset valuation has been noted by Griffiths (1986, p. 97):

> Be it as part of bid defence or an attempt to beef up the balance sheet, or a genuine effort to reflect true value to the business, fixed asset valuations will always present opportunities for creative accounting. These opportunities are not restricted to the balance sheet since the consequent charge to the profit and loss account for depreciation will also be affected. Fixed assets are pliable, flexible and mobile. Everything then except fixed!

Due to increased international accounting standardization (e.g., the International Financial Reporting Standards) in recent decades, opportunities for creative accounting based on fixed asset valuation have obviously narrowed, but, nonetheless, fixed assets in accounting are anything except fixed.

The methods and motives for creative accounting in the business sector are numerous, some of them being more ethical and acceptable than others. Blake et al. (1998) have categorized the methods into four categories. First, the accounting rules may allow a company to choose between different accounting methods, and a company can then choose a policy that gives its preferred image. Second, certain entries in the accounts involve an unavoidable degree of estimation, judgment, and prediction. Estimation of the useful lifetimes of assets in order to calculate depreciation and other assessments concerning future values and income estimations in general are unavoidable, and they

therefore offer opportunities to manipulate annual accounts. Inconsistencies in applied accounting policies are often signs of manipulation and attempts to mislead. The two other methods are based on transactions. The timing of genuine transactions (e.g., sales of an investment) is a way to increase the profit (by the amount of sales profit) and give the desired impression in the accounts. Artificial transactions with an obliging third party can be used both to manipulate the balance sheet amounts and to transfer profits between accounting entities and accounting periods (Amat and Gowthorpe 2004). "Sale and leaseback of an asset" for the rest of its useful life is an example of this kind of income and balance sheet manipulation, and it represents an artificial transaction with an obliging third party. Transactions between accounting entities in a consolidated group represent another example of an opportunity for earnings management using artificial transactions. For example, the owner company can sell assets (e.g., inventory, land, etc.) to its subsidiary, and the owner company can report the sale and increased earnings in the current period. For consolidated purposes, the affiliated transaction will be eliminated and not affect the financial statements (see Thomas et al. 2004).

Diana and Madalina (2007) have analyzed the flexibilities of the accounting environment and categorized six techniques of creative accounting:

1. Flexibility of regulation (in choosing a policy to follow)
2. Lack of regulation (in some areas of every domain)
3. Discretionary position of management (e.g., to decide the increase or reduction of the provision for bad debts)
4. Timing of some transactions (e.g., sale of existing stocks in a company's assets to increase the operating profit)
5. Artificial transactions (in order to manipulate both the balance sheet amounts or to move the profits between accounting periods, e.g., sale and lease back transactions)
6. Reclassification and presentation of financials (smooth modification of numbers in order to improve the investors' perceptions)

The reasons and motivations for creative accounting in the business context are many. The conflict of interests between different stakeholders (managers, shareholders, employees, tax authorities, etc.) represents a real cause for creative accounting (Diana and Madalina 2007). Blake et al. (1998) have presented reasons for the directors of listed companies to seek to manipulate the accounts. Among these reasons are:

- Income smoothing: Companies generally prefer to report a steady trend of growth in profit rather than to show volatile profits with a series of dramatic rises and falls.
- Manipulation of profit to tie it to forecasts (a variant of income smoothing).
- An income-boosting accounting policy change to distract attention from unwelcomed news (e.g., decline of the market share).
- Maintaining or boosting the share price, e.g., by reducing the apparent levels of borrowing and by creating the appearance of a good profit trend.

A whole set of reasons for creative accounting are tied to the various forms of contractual rights, obligations, and constraints based on the amounts reported in the accounts, e.g., directors' bonus schemes, and in many countries' income taxation.

Blake et al. (1998) have investigated the ethics of creative accounting. They stated that creative accounting can be defined in a number of ways and offered the following initial definition: creative accounting is "a process whereby accountants use their knowledge of accounting rules to manipulate the figures reported in the accounts of a business" (ibid. p. 3). The first half of the definition refers to a positive issue, the knowledge of accounting professionals, and the second half to the dark side of the issue, the use of the knowledge to manipulate the accounting figures due to the ambiguity of accounting rules. Accountants use their expertise for manipulation, control, falsification, and misrepresentation. In addition to "manipulation," several other negatively connoted words, such as "fiddling," "deception," "misrepresentation," "con trick," "matter of judgment," and "sleight of hand," are used in defining

creative accounting practices. All of these terms refer to deceitful and unethical practices in accounting (see Blake et al. 1998). Archer (1996) has examined the ethical issues raised by creative accounting in the light of the literature on the ethics of lying. This literature includes the evaluation of various excuses and justifications for lying in relation to creative accounting. The author concludes, "even in circumstances in which creative accounting would arguably serve a worthy purpose, that purpose would be at least as well served by honest communication" (Archer 1996, p. 55).

## Creative Accounting in the Public Sector

The use of creative accounting has generally been associated with the business sector, but it is also practiced in public administration, where in fact the context and regulations often offer ample opportunities to indulge in creative solutions in budgeting and accounting. The recent literature on creative accounting often concerns manipulation of public sector financial information in order to meet the fiscal rules and convergence criteria imposed by international or national regulators (see e.g., von Hagen and Wolff 2006; Benito et al. 2008; Vinnari and Näsi 2008; Leppänen and Näsi 2015; Näsi and Leppänen 2015). "Do fiscal rules lead to fiscal adjustments, or do they encourage the use of creative accounting?" asks Milesi-Ferretti (2003) in her article and concludes that fiscal rules can induce governments to engage in "bad" or even "ugly" creative accounting.

Vinnari and Näsi (2008) have reported how a Finnish municipality sold its water utility to its own energy company for a fair value (130 million euros) plus a goodwill payment (20 million euros), i.e., for the "market price" of 150 million euros. The wholesale transaction was financed by a bullet-type debenture loan given by the owner municipality to the energy company. Thus, no money transfers were made at the moment of the sale. The book value of the water utility's infrastructure assets at the moment of sale was 37 million euros. The owner municipality recorded the difference (113 million euros) as an extraordinary income item on its income statement for the fiscal year in question. This extraordinary income was big enough to balance the budgets and accounts of the owner municipality for the three subsequent fiscal years. In the consolidated accounts, transactions between the municipal accounting entities are eliminated and have no influence at all, but the requirements of the balance of the municipal economy in Finland were then stated on the level of the owner municipality's accounts. National regulations have been reformed since and the balance of the economy is now measured on the consolidated account level.

Both revaluation of the water utility and the sales and funding transactions between the owner municipality and its energy company were used to manipulate the accounts in order to show the balanced economy of the owner municipality but also to mislead the municipal decision makers, taxpayers, and residents. The municipal council and other stakeholders were told that the sale of the water utility only meant transactions in accounts and nothing else, but the whole truth is that the residents of the municipality are obliged to pay back the debenture loan equivalent to the sales price (150 million euros) plus the interest on the loan in their future water bills to the energy company. This sale is thus expensive for the water users and heavily conflicts with the intergenerational equity principle that should be taken into accounts in the public sector economy.

Municipalities may also use their water, energy, and other monopolistic utilities for "hidden taxation." If the "bottom-line" profit is restrained by regulations to be "fair" or "reasonable" – as it is, for example, in the case of water utilities in Finland – a part of a positive financial result can be subtracted ("hided") above the -bottom-line figure as "calculated interest on the basic capital invested." This expense item on the water utility's income statement is artificial. It is based on the idea that the owner municipality is an investor, who can determine the amount of the basic capital of the water utility and also the interest rate charged from the utility. Often a huge amount of money is calculated as an interest expense and annually transferred to the owner municipality's budget. The term used in the

income statement – "calculated interest on the basic capital invested" – may mislead the users of financial information, such as municipal council members. They do not necessarily understand the real nature of this item, which is essentially a money transfer from the water consumers to the municipality, a form of hidden taxation.

Means or techniques to engage in account manipulation in the public sector seem to be numerous. Benito et al. (2008) have analyzed proposals for the private financing of public works in Spain. They argue that all the new financing methods assessed are incorrectly named as "private," since the payments are finally made by the government by means of it budgetary resources. A deferral of accounting and budgetary recognition of these transactions, together with a false disclosure in financial statements of the debt connected with the projects, are clear examples of creative accounting with the aim of meeting the convergence criteria imposed by the European Union.

Fiscal rules are introduced to constrain governments. EU countries have adopted a set of rules to constrain deficits with the goal of keeping debt levels sustainable. Von Hagen and Wolff (2006) have provided evidence that deficits in Europe provide only limited information on the evolution of debt levels in the past. Their empirical evidence indicates that the introduction of the Stability and Growth Pact and the Excessive Deficit Procedure in Europe have resulted in creative accounting. The use of creative accounting is especially measurable when the fiscal rules become binding. The results confirm the vulnerability of fiscal rules to creative accounting (see also Bruck and Stephan 2006).

The accrual accounting model seems to provide even more opportunities for creative accounting than the traditional public sector budgetary cash-based accounting models. This is especially the case when accounting practices depend on the public sector's own regulations or if regulations only provide a general framework for accounting, and the more detailed principles and practices rely upon self-regulation and interpretation. Leppänen and Näsi have divided the means of creative accounting in the Finnish municipal context in two categories: solutions based on ambiguous and flexible accrual accounting rules (Leppänen and Näsi 2015) and solutions based on cross-entity transactions (Näsi and Leppänen 2015). In the former category, changes in estimated lifetimes and depreciations of fixed assets are typical examples of the means to manipulate both the balance sheet and income statement figures. In the latter category, sales of properties, leasing instead of investments, and privatization and outsourcing of activities, for example, represent means to influence the public sector budgetary economy and meet the fiscal rules and convergence criteria in question. Privatization, outsourcing, and other restructuring of activities are means to decrease the size of the public sector and in that way to influence the balance or other criteria set for the budgets and accounts.

## Conclusion

Creative accounting consists of different means to manipulate financial information in order to mislead, rather than help, the users of the information. The means and motives for creative accounting are numerous, and they are often difficult to identify, especially by non-accountants. In business, the managers of firms – in listed companies in particular – are responsible for keeping the shareholders satisfied, and their own bonus and compensation programs are dependent on the financial performance of the company. Even though accounting regulations concerning the listed companies are rigorous and control by the financial supervisory authorities is intensive, there are always some means to manipulate accounts in order to present a more favorable picture of the financial situation.

In the public sector, creative accounting is an even more serious issue than in the business context. Public sector accounts should be transparent, but they are not. Public economies have become very complex due to the new ways of organizing public services via public-private partnerships. Decision makers in the public sector are responsible for the use of taxpayers' money. Financial information should be transparent and understandable for elected decision makers, who often have no or only a poor understanding of complex accounting issues.

Creative accounting practices are a permanent challenge to the regulators both on the national and international level. Creative accounting, which generally involves preparation of financial statements with the intention of misleading the readers of those statements, is prima facie a form of lying (Archer 1996). Until the 1950s, the basic idea in (management) accounting was to present "absolute truths," followed later by an understanding that accounting numbers present "conditional truths" or even "socially constructed truths." Creative accounting concerns first and foremost financial accounting, and it involves ultimate solutions to purposely represent misleading information – or even lies – as truth.

There is always some flexibility and loopholes within all regulatory frameworks of accounting to give a creative view that serves decision makers' and preparers' own interests. Potential for creative accounting and fraud is enhanced by lax regulations and by decision makers' own motives and incentive systems. Similarly, potential for creative accounting and fraud can be reduced by stricter regulations, appropriate reward, and incentive structures – and what is most important – by higher ethics in accounting and auditing practices (Jones 2011).

# Credit Decision Rationality in the Money Lending Market

Shafic Mujabi, Victor Mbarika and Joseph Mpeera Ntayi
Faculty of Economics, Energy and Management Science, Makerere University Business School, Kampala, Uganda

## Synonyms

Astute credit decisions; Credit decision rationality; Intelligent credit decisions; Judicious credit decisions; Logical credit decisions; Prudential credit decisions; Reasonable credit decisions

## Definition

**Credit Decision Rationality**: A "credit decision" is a decision by a borrower to take credit. Credit decision rationality is a reasonable, logical, prudent, judicious, and well-thought out decision by a borrower to take credit. Credit decision rationality can also be defined as the literal, cognitive, and affective level of engagement of the borrower's mental faculties when making the choice to accept the terms and conditions of monies offered by the lender.

**Moneylending**: The dictionary definition of moneylending is often shared between its synonyms including usury, pawn credit, payday loans, and loan sharks. Most synonyms' definitions are associated with charging "excessive interest" and/or charging illegal interest which is not clearly defined. However, The Oxford English Dictionary defines it as "The fact or practice of lending money at interest." Moneylending is a financial transaction in which person A lends person B a sum of money for a fixed period of time with the agreement that it will be returned with interest. Moneylending is an informal and barely regulated form of credit between individuals where the lender exclusively determines and charges relatively high interest and outrageous terms to the borrower.

## Introduction

Rationality is a complex behavioral decision concept that can be deconstructed and simplified into statements on decision processing and/or reasoning out choice making perspectives. This entry theorizes credit decision rationality from a cognitive psychology lens redirecting it from the financial and expected utility paradigms that have long explained monetary decisions. The entry attempts to bring into view the cognitive, attitudinal, and psychological conceptualization of the consumer credit rationality in the money lending market. The uniqueness of the money lending market offers a decision platform where both the cost-benefit and interest-return calculations get into difficulty in attempting to explain decision-making rationality due to terms, time, saliency, or scale. The consumer decisions in the money lending market operates through financial literary deficiencies, attitudinal rigidities, cognitive insufficiency, and biases arising from the way social and financial information is stored, retrieved, and processed leading to formulation of choice problems that are inconsistent with financial and economic rationality. The entry further discusses how cognitive psychological anomalies influence financial decisions-making behavior and their implications for academics and finance decision analysis.

The entry heavily leans towards the realization that consumers in the pawn credit or pay day loans may not necessarily rely on the financial paradigm for rational decision-making as has been hypothesized in classical economic literature. One peculiar characteristic of this market is its tendency to disregard not only the high interest rates but also outrageous terms and conditions which bring into question the sufficiency of financial variables in explaining credit decisions (Bertrand et al. 2005; Helmore et al. 2009; Holden 2010). The utilization of the nonfinancial variables, in the credit decision-making literature, is well informed by the informal world of work taken from sub-Saharan context. Our emphasis on cognitive psychology is informed by the realities of the circumstances of the borrowers who choose to deal with money lenders despite the existence of cheaper and more transparent credit sources. It is important to note that even when financial consumers

fail in articulating financial or economic utility, their subconscious and unconscious states of mind will continue guiding financial decisions anyway. These are still guided by the extent of their contact with the world of credit. The money lending market is unpredictable and the decisional machinations of borrowers are still hidden behind a cognitive psychological veil. Furthermore, when it comes to money, significant psychological and cognitive differences exist in the rules that financial consumers follow.

Literature has shown that those with prudent but flexible and rule systems often fare reasonable better than those with complex and rigid rule systems that are typical of classical financial decision-making (Larrick 1993; Shiller 2000; Skinner et al. 2008; Block-Lieb and Janger 2005; Melzer 2011; Bhutta et al. 2015; Irungu and Nafula 2017). Furthermore, financial consumers have been seen to develop seemingly elaborate but not necessarily consistent rules or heuristics. This helps them account for both acceptable and unacceptable utilization as well as the expected outcome of exchanges of money. Thaler (1985, 1990), Prelec and Lowenstein (1997) interestingly noted that, for credit consumption, "Neither a borrower nor a lender becomes a principle for conduct or an instruction for rational behavior in a credit transaction." Anomalies in credit decision-making arise because financial consumers especially borrowers are inconsistent and deficient in time discounting. Most of them fail to discount critical financial events in the distant future consistently with short-term discounting. This has been attributed to short-term gratification delays that have a strong affect than the anticipated long-term benefits and costs are difficult to perceive in the present on the same basis as immediate benefits and costs. This explanation that is most rooted in stock market participants leaves room to discredit the role of classical financial calculations in informing many financial decisions.

Psychologists have used the terms *problem-solving*, *reason-based*, or *rule-driven* to refer to behavioral processes that override cost-benefit calculations, relying instead on principles or analogies to guide decision. Drazen Prelec and Loewenstein (1991) distinguishes this view of decision-making from utility-maximization models by the cognitive processes involved: Decision analysis, which codifies the rational model, views choice as a fundamentally technical problem of choosing the course of action that maximizes a unidimensional criterion utility. The argument is that immediate intuitive satisfactions are easy to experience or difficult to not experience. Human beings have been seen to have difficulty previewing the experience of future gains and losses, particularly if they are uncertain (Frank 1992; Hoch and Loewenstein 1991; Lowenstein 1998). Earlier on, Herrnstein and Prelec (1991) had discovered that temporal anomalies in psychological and cognitive differences were to blame for the failure of human beings to disregard the illusions that flawed their discounting time-related decisions.

## Rationality: Its Conceptualization and Antecedents

It is typical for most linguisticians to mistake rationality as getting a decision right; it is rather the way the decision maker gets it right. To inform this understanding, a suboptimal decision may have been reached through thorough critical analysis and reasoning while an optimal decision may be reached without consideration of facts and or active engagement of relevant knowledge. Ackoff (1974) described human decision-making as "mess management" and aligning it to the world of work being messy, he further noted that the cognitive processes involved in bringing those two worlds together are the messiest of all. This is summarized and presented as in Fig. 1. There are so many complex schematic imaginations and iterations that go on in the mind of the informal credit borrower before a final decision to borrow is reached. This movement in rationality is scaled from irrationality indicated by an avoidant stage to rationality indicated by the analytical decision-making style as shown in Fig. 1.

The standard model in economics which has also been adopted in finance is premised on the understanding that consumers behave as if

**Credit Decision Rationality in the Money Lending Market, Fig. 1** Scaling credit decision rationality: Avoidant to analytical

information is processed to form perceptions and beliefs using strict Bayesian statistical principles calling it perception-rationality. Preferences are primitive, consistent, and immutable conceptualized as preference-rationality, and the cognitive process is simply preference maximization given market constraints referred to as process-rationality. Economics has always been concerned with the motivations and behavior of consumers. In the broad meaning, rational behavior is sensible, planned, and consistent and believed to govern most conduct in economic markets. The motivation for this is that markets tend to punish foolish behavior. However, rationality has been given a much more specific meaning in the classical theory of consumer demand perfected by Hicks and Samuelson (1974) that forms the cornerstone of courses in economic theory. In the 1955 Herbert Simon's words, "The rational man of economics is a maximizer, who will settle for nothing less than the best." While this model of consumer behavior dominates contemporary economic analysis, there is a long history among economists of questioning its behavioral validity and the seeking of alternatives to rationality continues in behavioral decision-making in many fields of academia.

Rational choice behavior in many consumer fields including financial consumption is getting continuously linked to attitudinal, heuristics, and cognitive perspectives, which is informed by beliefs and perceptions based on available information and alternatives influenced by affect, attitudes, motives, and preferences. The *cognitive and/or psychological process* for decision-making is the mental mechanism that defines the cognitive task and the role of perceptions, beliefs, attitudes, preferences, and motives in performing this task to produce a *choice*. It is thus the aim of this entry to hypothesize a credit decision rationality model that will give an alternative explanation that will harmonize on the neoclassical economic and psychological views that have radically different elements and process on rationality. First, the primary focus of psychologists is to understand the nature of these decision elements, how they are established and modified by experience, and how they determine values. The primary focus of economists is on the mapping from information inputs to choice. The precept "Economists know the price of everything and the value of nothing" correctly characterizes the discipline's scientific priorities. Empirical evidence from social and cognitive psychology research suggests that contemplative access to cognitive processes is limited (Nisbett and Wilson 1977), pointing to cognitive processes that are often confounded by biases and heuristics (Kahneman et al. 1982; Simon 1955; Tversky and Kahneman 1973, 1974, 1983; Wason 1960), and that an intuitive mode of processing parallels the rational model (Epstein 1994; Kahneman 2003; Lieberman 2003) and is active and influential in decision-making.

Past investigations and meta-analytical studies that have studied financial decision rationality have contextually focused on other decisions like stock trading, entrepreneurial risk taking, insurance decisions, credit utilization, loan approval, and none has dealt with the decision of the borrower to take credit. The few studies that have focused on credit have looked at debt rather than credit decisions looking at repayment, credit utilization, and the general after math of acquiring a loan. Though the distinction is unclear, "debt" is an obligation that the borrower is either unable to discharge or trying to avoid discharging, in contrast "credit" implies an arrangement to borrow

**Credit Decision Rationality in the Money Lending Market, Fig. 2** Credit decision rationality: conceptualisation and antecedents

money. This is the starting point of this entry's contextual diversion, and the entry theorizes what happens before the credit transaction has happened, the peculiar nature of credit (informal credit) and unique setting within which the credit decision is being made. The significance of informal credit decision presents the much neglected complexity and dynamism that is not typical of formal credit which forms the basis of many of the criticisms of the stochastic models of financial decision-making. From the preceding discussion, we derive a conceptual model presented in Fig. 2, which could be tested empirically by scholars.

Figure 2 is based on a number of demand and supply assumptions which we present

## Supply Assumptions

### Free and Mobility of Information

The conceptualized model assumes that information on the credit market is freely available. This means that there is no price for information for comparing interest rates, terms, and conditions for loans. This is an assumption across the whole credit market that there is no additional price on the search for credit market information. The word "free" on information also means that information moves freely and is accessible to all credit consumers from both main formal and informal credit. Most informal credit markets in developing countries fulfill this assumption.

### Unregulated Money Lending Market

The money lending market is assumed to be highly unregulated or at least hard to enforce laws and regulations that would restrict the rationality of credit transactions for both money lenders and borrowers. If money lenders' transactions and procedures are closely regulated, they would greatly affect consumer rationality. This assumption lays ground for the money lending market to assign a peculiar credit processing assumption as borrowers are left to the mercy of lenders. This means the market is free of conditioned rates and terms which are normally a characteristic of mainstream credit.

### Existence of Cheaper Credit Alternatives from Both Mainstream Credit and Informal Sources

From its inception, informal credit finance including money lending has always been looked at as an alternative to mainstream credit and other types of credit that offer cheaper and/or better credit terms. All propositions and hypotheses can thus hold if the borrower is opting for the money lender as an alternative. For a borrower who does not have other credit alternatives, rationality ceases to hold as they do not have a choice but to utilize the only credit source available. Furthermore, the price of credit seems the most crucial debate that propels the debate and inquisition into the money lenders' market. High interest is typical of this market and in times quadrupling alternative sources. If the price comparison in the interest rate for other credit sources is lower (thus cheaper), the propositions that credit rationality proposes fall. The assumption is more realistic than not as evidence shows that most money lenders are charging the above average rates and financial regulators have hardly been able to control this phenomenon.

### Equilibrium Position and Nature of the Market

These assumptions point to a free (moneylending) market whose equilibrium is determined by demand and supply forces. This is the perfect assumption to interrogate the rationality of market participants. Without this equilibrium, the rationality of decisions made here would not be those independent information processing. This would mean that rationality is not free and the decision makers are no longer independent in information processing and will.

## Demand Assumptions

### No Constraints to Qualification and Access to Credit Alternatives

The existence of alternatives is not enough for a choice to be made if the consumer (borrower) cannot either access or qualify for financial product alternatives. There are money lenders clients who not only have access but also fail to qualify for alternative credit sources. For these borrowers, credit rationality propositions do not hold for them. Alternatives that cannot be exploited are as good as nothing. This assumption seems most realistic because the money lending market is a phenomenon more visible in the urban environments where access to alternative credit is more available and urban dwellers tend to qualify for credit than their rural counterparts.

## Discussion

### Financial Literacy and Financial Decision Rationality

The expansion and dynamism of today's financial markets are providing a wide range of complicated financial products and services to choose from, hence complicating the individuals' choice (West 2012). Financial literacy is thus assumed to be a plan to improve financial consumer choices and behavior in terms of the products and services offered. It has been established in behavioral finance literature that effective financial decision-making is related to both financial competencies and levels of financial anxiety (Shapiro and Burchell 2012). Many empirical studies have ascribed the deficiency in fundamental knowledge on the low preference and demand for formal banking services compared to informal sources (Giné and Yang 2009). Contrary to informal financial products customers, informal credit presents more complexity without a proportionate growth in financial literacy levels to very vulnerable classes of people who borrow from informal sources as pointed out by Lyons (2005). Particularly financial literacy is needed for consumers who are exposed to very unscrupulous financial marketers in both formal and informal financial market (Braunstein and Welch 2002).

As earlier noted, financial literacy pointed to the ability to make decisions regarding the management of money and other assets. It is thus not surprising that Beal and Delpachitra (2003) attributed the overuse of credit cards and failure to repay to financial illiteracy. He also attributed reckless consumption, making unwise high-risk investments inconsistent with required capital stability, undertaking overly optimistic loan

obligations, and foolish commitment to get-rich-quick schemes to poor financial literacy. The multiplicity of consequences reported on financial illiteracy include consumer debt, insufficient plans for retirement and reduced saving, increased reasons to divorce and mental sickness, emotional strain and misery, and dignity and inadequate diversification (Stango and Zinman 2007; Hilgert et al. 2003; Lusardi and Mitchell 2006, 2007).

Fogarty and MacCarthy (2006) noted that the consequences of such all these behaviors are potentially devastating from both a societal and a personal level. Empirical evidence suggests more financially illiterate households are more prone to decisions that point to portfolio under-diversification, indecision and inertia in their portfolio management, and over-indebtedness through informal sources of borrowing (Guiso and Jappelli 2008; Kimball and Shumway 2010; Klapper et al. 2013; Lusardi and Tufano 2009). Norvilitis et al. (2006) and Lawson and Todd (2002) concluded that financial literacy helps one make better decisions regarding spending, borrowing, and saving. Van Rooji et al. (2007) find that individuals who are not financially knowledgeable do not make sound investment decisions on the stock market and are more likely to use high-cost means of borrowing (Lusardi and Tufano 2009). It has been pointed out that financial illiteracy was one of the leading causes of the financial crisis of 2007. It is important for credit decision makers to integrate financial knowledge and skills with real life processes leading to better financial interests. In short, financial literacy is important for better decision-making, to make better investments. *Financial literacy may also trigger cognitive biases of money lenders' clients.*

## Cognitive Ability and Financial Decision-Making Rationality

Several studies and literature in this review show that the level of cognitive abilities affects the broad financial decision-making. A few literature sets contain specific information on credit portfolios. Cognitive ability sometimes referred to as "general intelligence" is a very well-known predictor of many social outcomes like educational and occupational issues. Cognitive ability refers to things that people are capable of doing denoting people's processing and representation of information for decision-making (Urzúa et al. 2006). Studies have already demonstrated two stylized facts about the relationship between cognitive ability and economic behavior (see Frederick 2005; Benjamin et al. 2006; Bonin 2007). First, individuals with high cognitive abilities seem to be less risk averse when gambling in the positive domain. Second, they seem to be more patient. Studies reviewed showed that individuals with low CRT scores are significantly more likely to be subject to the conjunction fallacy and to conservatism with respect to probability updating. Test scores have no influence on the amount of anchoring, although there is evidence of anchoring among all subjects. It is also conspicuously surprising that many economic models show that cognitive ability is typically independent of both risk aversion and impatience.

In a highly acclaimed paper by Gerardi et al. (2010), they found a strong association between numerical ability and mortgage default during the recent financial crisis. In risk preferences domain, there is no widely shared presumption about the influences of cognitive ability and almost no sufficient evidence research on the topic. Studies in this review use the direct measure of cognitive abilities as an independent variable. The dependent variables are correlates of cognitive abilities identified in the cognitive psychology literature. They extend the model of Cagney and Lauderdale with an over 70 age dummy variable because cognitive abilities dramatically decrease after the age of 70 (Baltes and Lindenberger 1997). Consistent with Holtzman et al. (2004), their cognitive models focus on social network proxies. Since the level and type of social activities change with retirement, their cognitive ability model also includes a retirement dummy variable. This is in line with other studies which find evidence that in particular individuals with lower cognitive abilities are less likely to participate in the stock market. In particular, Grinblatt et al. (2010) found evidence that even among the most affluent individuals, higher IQ increases stock market participation. This implies that individuals with high

cognitive abilities face lower cost of acquiring information and thus higher participation as well as return in the stock market. In addition to this, Calvet et al. (2007) concluded that individuals with low cognitive abilities might be aware of their weakness and stay out of risky financial decision options to avoid investment mistakes.

Cole and Shastry (2009) and Small et al. (2001) propose several alternative mechanisms through which cognitive abilities could be related to financial market participation. The central finding is that individuals with lower cognitive abilities are more likely to suffer from biases and make irrational or minimum benefit decisions. Kimball and Shumway (2010) suggest that the most plausible reason is that more cognitive ability decision makers are better informed and therefore are better at managing their portfolios. They are also less likely to apply naive diversification heuristics, like the 1/n rule. Moreover, they invest fewer amounts of their assets in stocks of the company they work for, and they are less frequently suffering from a home bias. Guiso and Jappelli (2008) also find that a lack of diversification is related to low levels of cognitive abilities. They argue that individuals with low cognitive abilities are likely to undervalue the benefits from diversification – or even ignore them altogether. They are further said to have difficulties in assessing the correlation between their assets' returns. Similarly, Grinblatt et al. (2010) found that individuals with higher IQ invest in a larger number of different stocks and are more likely to hold mutual funds in their portfolio. Grinblatt and Keloharju (2009) observed that high IQ investors on average earn 11 % higher returns than low IQ investors. This concludes that *cognitive ability not only influences the credit decision rationality of money lenders' clients but also cognitive biases of money lenders' clients.*

### Credit Attitude and Credit Decision-Making Rationality

Eagly and Chaiken (1993) noted the important role that attitudes play in elucidating or analyzing credit behaviors of chronic debtors and those who are not. Credit attitudes defining decisions on retail credit have remained inconclusive and unclear particularly on the consistency between attitudes and behaviors. It emanates from the difficulty in understanding which of the two precedes the other. It however came to notice that particular creditors provide clarity, for instance, when it is friends or relatives, there are higher increments in the propensity of credit use and thus inducing a more positive attitude (Kaynak and Harcar 2001). For logical reasoning, the former may influence the latter, and beliefs tend to vindicate the debtor's relationship with the creditor (Lea et al. 1991; Ajzen 1996).

Xiao et al. (1995) had done a more critical study examining the role of different components within attitudes by studying who studied students' attitudes to credit specifically credit cards. Without regard to revolving credit and/or card usage, all examinees turned out to have a positive credit attitude but significant variances appeared between their affective, cognitive, and behavioral dimensions. This came with a noticeable positive relationship between the strength of cognitive and behavioral and the use of revolving credit. The same result emerged in Hayhoe et al. (1999), confirming both the existence of a positive relationship between the affective component and the use of credit cards and the significance of the cognitive dimension in prompting credit behaviors.

Earlier on, in a study by Livingstone and Lunt (1992), a significant positive relationship between a financial decision makers's positive or negative credit attitude and their indebtedness. Lea et al. (1993) had earlier on reported the same through a comparative study of households which gone into debt with a water-utility firms. Two years later, Zhu and Meeks (1994) were unable to replicate the same but the explanation was that results were from an educated sample. A year later, Davies and Lea (1995) analyzed attitudes of college students who used student loans and found a positive relationship between positive attitudes and indebtedness, in divergence with the former findings of Lea et al. (1993). In this review, studies devoted to debtor's individualities generally concentrate on personal factors to attribute meaning to being in debt and on the relationships between life events and the indebtedness risk. Particularly the

individual factors looked at included incentives, personality, abilities, preferences, purposes of credit, and perceptions relating to the general credit economy or environment and debtor's financial situation. My hypothesis focusing on consumer credit will look at how favorable attitudes may affect rationality and judgment of credit with recourse to money lenders and the association with a higher or lower tendency to turn to money lenders despite their undeniable ostracization and expense.

According to Lea and Xiao et al.'s conceptualization and reviews by Pattarin and Cosma (2012), the cognitive dimension consists of the debtor's information set, knowledge, opinions, beliefs, and perceptions regarding credit, which have seasoned during their life experiences with the credit environment. The cognitive dimension helps to establish the frame of reference within which credit behavior resides. The affective element consists of sentiments and/or emotions stimulated by credit. The affective element defines the meaning ascribed to credit and the configuration of likings, which can be slanted by outside factors in the cognitive element. The behavioral element pertains all credit behaviors and proactive intents that may not yet converted into actual behaviors. The conditioning that leads to credit attitudes includes exchanges between universal contextual aspects like behavioral patterns and culture, social grouping, money ethics, materialism, and esthetic values and subjective issues that bear on behavioral prototypes through opinions and processes of imitation or distinction.

All these components alter individual credit opinions, improving the comparative assessment of the debtor's situations in which materialistic aspects of economic classes are at play and thus positive attitudes are observed with respect to credit (Watson 2003). Explaining debt situations between individuals tends to compare social groups with comparable monetary conditions indicating consistency in debtor's perception of belonging and their specific credit condition. A particular uniformity in social level has also been pointed out by Lea et al. (1993) as individuals with debts are more likely than those without to confirm that the majority of their relatives and friends are also in debt and they consider it as normal. This study recognizes this analysis as part of the examinations to add on literature. The recourse to money lenders satisfies the needs for social-economic identification and consumption, predicting that being in debt involves a psychological dimension and increase in financial stress levels (Brown et al. 2005). From this review, we can conclude that *credit attitudes impact credit decision rationality of money lenders' clients and cognitive biases of money lenders' clients.*

### The Mediating Role of Cognitive Biases

Nigam et al. (2018) have explicitly noted that cognitive biases are crucial investigation mediators and/or moderators for financial judgment. Earlier on, Shefrin (2015) presented the results of correlational studies between decision maker's judgment of risk and actual returns and concluded with a similar position that financial decision makers' judgments of losses from risk and profits (return), mediated by heuristics on market and price experiences. Studies indicated other psychological and behavioral aspects affecting financial decisions judgment and choice emanating from these rules of thumb (Victoravich 2010), social influence (Andersson et al. 2014), overconfidence and over optimism in analysis (Jones and Johnstone 2012; Peterson et al. 2015), decision goal (Young 2009), subjective confidence (Du et al. 2011), and evaluation disclosure reliability (McEwen et al. 2008). It is thus not surprising that a number of studies report that forecast biases as having effect on rational appraisal of market intelligence (Nursimulu and Bossaerts 2014).

The early 1970s produced one of the most influential research programs by Daniel Kahneman and Amos Tversky; the heuristics and biases programs in this expanded the knowledge on human reasoning and rationality. Barberis et al. (1998) is among the first seminal papers that incorporated belief biases into an economic model. The central premise was that decision makers' limited cognitive and reasoning ability necessitates a reliance on heuristics like availability, representativeness, and the anchoring-and-adjustment heuristics. Although most heuristics

are "highly economical and usually effective, they lead to systematic and predictable errors" referred to as biases, fallacies, and or cognitive illusions (Gilovich et al. 2002). Biases have been seen to be key mental tools to overcome the complexity, probability, and uncertainty in which decision makers find themselves; however, utilization of biases can also exact considerable costs in terms of cognitive illusions, which may be difficult to "debias."

In contrast to the classical rationality by many economists, heuristics and biases can change the decision-making style of people's reasoning and render it systematically error-prone. This is in line with bounded rationality. For instance, many economic decisions such as credit appraisal involve the process of updating probabilities, which, according to the rationality assumption, people do in a Bayesian way. Credit decision makers are not immune to these cognitive biases which manifest in terms of information processing biases, belief biases, and attribution biases.

A brief outline of important biases studied in the last decade includes but not limited to heuristics, information processing biases, belief biases, attribution biases, selective attention biases, memory and judgment errors, sentiments, and subjective cognition problems.

***Information processing biases*** include errors in decision maker's thoughts when processing information. Money lenders' clients need to gather and consider information to make behavioral choices consistent with their goals and beliefs, although too much information might be irrelevant to making credit decisions. Ignoring critical information is usually detrimental and may lead to less rational decision-making. Woodward et al. (2008) noted that prior experiences and inflexibilities from momentary emotional and psychological distractions can make decisions less rational. The difficulty is identifying the right information and sieving irrelevant information. Such biases and attributions may influence the ability to make wise decisions because of a flawed information analysis process.

***Jumping to Conclusions (JTC)*** bias as a tendency to gather less or minimum information than what is needed to reach a reasonable decision. This bias is common and associated with overconfident probabilistic judgments (Freeman et al. 2004). A study by McKay et al. (2006) found that delusion-proneness was associated independently with the need for closure and jumping-to-conclusions bias. The bias is thus a measure of overconfidence bias as the neglecting and ignoring of relevant information is the cause of jumping to conclusions. Jumping-to-conclusions bias studies have been done on many experimental reasoning tasks, intolerance of ambiguity, and indecision concerning real-life dilemmas. Overconfidence about revenue forecasts can make borrowers accept outrageous interest rates and unreasonable conditionalities. They have indicated that decision makers overreact to positive information but underreact to negative information, thus appearing systematically overoptimistic and thus jump to conclusions.

### Belief Perseverance Biases

Probabilistic beliefs are central to decision-making under risk. Systematic errors in this reasoning can mean a lot to many financial decisions that involve risk, including investing for retirement, purchasing insurance, starting a business, and searching for goods, jobs, or workers (Benjamin 2019). Recently, Nigam et al. (2018) noted that belief biases and prejudices affect manifestation and realization of investor viewpoints. Some of the belief biases include belief inflexibility biases, affective self-affinity bias, projection bias, belief about deception bias, ego-centric bias, and self-deception bias.

***Belief inflexibility or belief perseverance*** is a psychological phenomenon in which decision makers adhere to certain beliefs after receiving convincing evidence and proof that casts doubt on that belief. Due to this, decision makers hold on to a previous decision because they are apt to keep on believing it, even when faced with contradictory symptoms. Consequently, they are inclined to accept conclusions that are consistent with their belief systems without challenge and to reject those that are not, despite the underlying logic and plausibility. Belief perseverance biases come from attempting to avoid conflicts between beliefs and reality. On experiencing such conflict,

a mental discomfort arises to find a resolution in the easiest manner possible. The psychological stress experienced by someone holding two or more contradictory beliefs at the same time called cognitive dissonance. That is, some financial decision makers tend to ignore or minimize any information that conflicts with a particular belief.

### Attention for Threat Bias

Attentional for threat bias is defined as exaggerated attention toward threatening information and stimuli (Bar-Haim et al. 2005). Leleu et al. (2014) noted that decisions made by individuals suffer from safety and threat-related disorders which can have a profound impact on their ability to make rational decisions. It should be noted that little is known about how threat attention influences specific decision variables in finance decisions. The extant literature has been examining its clinical dynamics in psychosis rather than its role in decision-making. We will attempt to explore this by examining the overlap in its mediation of decision-making and the potential impact of the documented psychological and cognitive deficits. Attentional biases in general involve the tendency to pay attention to some things while selectively ignoring others. This impacts not only the things that we perceive in the environment but the decisions that we make based upon our threat and safety perceptions. Studies have shown that threat targets suppress thoughts of negative stereotypes and experience a depletion of self-control resources, that is, ego depletion (Inzlicht et al. 2006). This ego depletion could affect decision-making. Behavioral evidence for the association between anxiety and increased attention toward threat has been garnered from a range of behavioral tasks. Potentially, focusing attentional resources toward threatening stimuli, rather than benign stimuli or signals of safety, contributes to the development of anxious behavior.

### External Attributions Bias (EAB)

Preliminary investigations have shown that many moneylenders' clients tend to blame all their credit woes and problems on the money lenders. They perceive money lenders as a threat to their financial wellbeing despite some of them acknowledging that they always go back to them even after getting problems with them. The bias to perceive other people as hostile and their self as a target of hostility is present in people with persecutory delusions (Combs 2009). The self-serving attribution bias (SAB) is a synonymatic bias to external attribution bias; it refers to individuals taking responsibility for successful outcomes but blaming circumstances or other persons for unsuccessful outcomes (Gervais and Odean 2001; Billett and Qian 2008; Libby and Rennekamp 2012). Self-serving attribution bias is the reciprocal bias that involves overestimating the extent to which internal characteristics (skill and effort) versus external characteristics (luck and task difficulty) are contributing factors to better performance.

While there is universal evidence that individuals exhibit EAB and SAB in lab experiments or surveys, relatively little direct evidence based on archival data exists on whether financial decision makers and in particular borrowers have EAB or SAB and whether borrowers' SAB has decision consequences. The goal of this study will be to examine whether corporate managers exhibit SAB or EAB. Given the importance of the external attribution bias in the behavioral economics literature, it is crucial to empirically test for its existence in finance decisions.

### Subjective Cognition and Judgment Problems and Errors

Decision makers' and cognition problem biases are particular to comprehension and fusion of information. These biases in the analysis of information are anomalies that constrain optimal decision-making. Cognition drives judgment, given that cognition and emotion jointly drive all financial decisions (also known as the affect heuristic). Cognition and judgment complement each other in understanding financial activity and market psychology. Although the effects of cognitive and emotional biases are similar, finding a solution to emotional biases often requires great care because these biases are tied deeply to personal sentiments. Subjective cognitive errors and problems are generally being corrected more easily than emotional biases because they are ingrained

in the decision makers' emotional psyche. Thus, if credit is put into the context, borrowers are seen to primarily manifest emotional biases due to desperation and thus can only attempt to moderate their effects rather than try to remove them completely (Taffler and Tuckett 2010).

### Others Biases in Financial Decision-Making Rationality

Apart from the cognitive biases and heuristics reviewed in this section, there are specific biases which have been contextualized to particular various decision-making and rationality. These include fear of unknown, optical bias, home-bias, regret aversion, equity-mortgage bias, myopic loss aversion, certainty effect, uncertainty avoidance, hedonic editing hypothesis, and Pygmalion; these were a part of the central findings in the works of Benjamin et al. (2006). Kimball and Shumway (2010) found that individuals with lower cognitive abilities and lower financial knowledge are more likely to suffer from biases and thus make decision mistakes. They suggested that the most plausible reason is that more financially literate investors are better informed.

### The Biases Research Direction

Studies suggested that biases lower decision quality; literature recommends minimizing their biases. Managers should pay more careful attention to the reliability and predictive validity of information. They can compare the information they gather to more make more analyses. Recalling past events increases one's belief that they will reoccur (availability heuristic), forcing the borrower to recognize that certain situations are difficult to predict and beyond one's control. Despite the suggestions above, it will still be extremely difficult for borrowers to minimize biases in their decision processes. In fact, money lenders' clients are often unaware that they exhibit biases as had earlier by Hogarth in the 1980s. The early 1990s recommended modifying group decision-making processes as the key to coping with individual-level biases (Russo and Shoemaker 1992).

Some, however, argue that biases should not be minimized because biases generate the action and the commitment necessary to starting a venture (Busenitz and Barney 1997). Even if money lenders' clients limit their biases, they still need to take steps to minimize any negative ramifications stemming from those biases. For example, they might avoid damage caused by initial misperceptions (Busenitz and Barney 1997) if they institute processes to increase learning, thereby allowing the venture to adjust to unfolding realities. Similarly, even if lowering risk perception through biases is a prerequisite to borrowing decisions, the borrower still needs to make sure that adequate safety nets are in place. Because decision-makers exhibiting overconfidence treat their assumptions as facts, they may not see the uncertainty associated with conclusions stemming from those assumptions. They, therefore, may erroneously conclude that a certain action is not risky or otherwise. This is consistent with the arguments of several reviews on general intelligence in learning. We therefore conclude that *cognitive biases mediate the relationship between (a) financial literacy and credit decision rationality of money lenders' clients, (b) cognitive biases and credit decision rationality of money lenders' clients, and (c) credit attitudes and the rationality of informal credit decision rationality of money lenders clients.*

## Conclusion

A number of constructs exist in identifying individual differences in general decision-making but Scott and Bruce's (1995) General Decision-Making Style concept and inventory has been proven to be most validated, encompassing, and widely used approach. This inventory measures rationality and intuitiveness as well as three other complementary styles: dependence, avoidance, and spontaneity. Conceptually, these dimensions are independent but not mutually exclusive. Cognitive scientists believe that "rational" or "intuitive" decision-making styles lead to better life decision outcomes, and on the other hand "avoidant" and "spontaneous" lead to regrettable and negative decision outcomes. The dependent decision-making style has not proven to be related

to decision outcomes. This reveals that financial literacy, cognitive abilities, and credit attitudes mediated by cognitive biases predict credit decision rationality. More empirical research is needed to interrogate these relationships in a money lending market.

# Criminal Networks

Jorge Fábrega
Center of Social Complexity Research, School of Government Universidad del Desarrollo, Santiago, Chile

## Synonyms

Organized crime

## Definition

A group of individuals who collaborate in the development of illicit activities sometimes, but not necessarily, organized as an established criminal entity. Generally, they do network, so they know each other and work with, rely on, and collaborate with each other.

## The Origin of the Concept of Criminal Network

The research about the concept of organized crime has evolved from the notion of the existence of a rigid organization (a top-down perspective) with a vertical integrated hierarchy, with a superpower and merciless boss, to another view of a flexible coordination among co-offenders who, sometimes, create stable criminal groups (bottom-up approach). In this evolution, the reference to criminal groups as networks was originally a metaphor to describe sets of dyadic relationships among criminals, but later researchers used tools and techniques from the network theoretical approach to study their governance structure. Currently, a network approach to criminal behavior is at the forefront of research on criminal activities.

Crime is an umbrella concept that identifies a diverse set of illegal activities. These include several types of behaviors such as the voluntary participation in the production and exchange of illicit goods and services (e.g., drug trafficking and product counterfeiting), grabbing other people's resources (e.g., robbery, piracy, and cybercrime), smuggling vulnerable populations (e.g., for trafficking sexual and labor exploitation), laundering money, and trafficking weapons, among others. Both the use of violence and the exploitation of others are commonly used by the organization although none of them is a requirement for their existence. For instance, cybercrimes like theft of user digital credentials (e.g., via phishing) are criminal behaviors in which co-offender coordination is largely based on digital communications (Leukfeldt 2014). On the other hand, the fact that networked crime activities lack a political or ideological purpose distinguishes them from acts of terrorism (although some terrorist groups may get involved in criminal activities, as well).

Long-standing controversies exist in the scholarly literature on the governance structure of criminal activities. The notion of organized crime is at the center of those controversies (Von Lampe 2001). And the concept of criminal network is a subset of that dispute. Although some criminal activities can be made by individuals alone, most of them involve the cooperation and coordination of two or more subjects. This immediately raises questions on criminal groups about:

- How they solve incentive-related problems
- How they control opportunistic behaviors
- How they succeed to establishing roles
- What mechanisms they use to enforce their agreements
- How and with whom they create partnerships
- How their relationships influence each other in shaping a criminal career
- How new participants are brought into the illicit exchanges
- How they move into new and more specialized forms of crime and other illegal activities.

The concept of criminal network is one of the latest bricks in the research on organized crime adding new pieces to theoretical and empirical controversies. Historically, such endeavors began in the late 1910s when the term "organized crime" was used by the Chicago Crime Commission to refer to a group of individuals who make criminal activities a business (Von Lampe 2001).

However, between the 1920s and the late 1970s, the concept evolved to refer to organized crime as a hierarchical and powerful stable criminal syndicated organization. Some structures included the Italian-American Cosa Nostra, the Japanese Yakuza, the Lithuanian and Russian Cook Group, and the Chinese Triads. That vision included characters such as Alphonse "Al" Capone who became the public image with whom organized crime was associated. In part, the vision of crime as the monopoly of highly structured armies of criminals under the ruling of a "godfather" was caused by the sensationalism and superficiality with which media covered crime-related news. For instance, cocaine cartels, like the Colombians "Cartel de Medellín" or "Cartel de Cali," did not exist until the media and government action forced independent smugglers like Pablo Escobar to behave as a "grandfather" or cartel leader (Kenney 2007). The ethnographic-based evidence of more complex arrangement became clear in the 1970s, discouraging a description of all criminal activities as coming from vertically integrated organizations. For example, through field research, Albini (1971), father of the revisionist school of organized crime research, found that the Mafia was like a socially constructed organization rather than a criminal empire commanded by one tough and ruthless leader. Then, by the middle 1970s, based on ethnographic evidence, some scholars started to disagree with the accepted concept of organized crime as a hierarchy, and they started to focus on the organization of crime as more erratic with lesser structured organization.

In the middle of that debate, the concept of network became a good metaphor to describe the flexible and informal arrangement that were observed in the interaction among criminals. Following bottom-up approaches, the 1970s and the 1980s saw an increasing number of researchers doing field research, studying emerging patterns of relationships among criminals. However, those approaches mostly used the concept of networks as a metaphor rather than an enforcing mechanism capable to explain the governance of organized crime. During the 1990s, a systematic use of social network analysis and network theory to refer to organized crime started its route to the criminology's mainstream. Although there is still a controversy on its validity and scope to explain organized crime (Von Lampe 2009), the concept of criminal network to refer to organized crime became part of the core in the research on criminal activities at least since the late 2000s (van der Hulst 2009; Mainas 2012).

By focusing in the dyadic relationships that criminal subjects build, the concept of a criminal network has proven to be functional to reflect modern forms of collaboration also observed in legal markets, including international ones. In fact, the flexibility that the concept of criminal networks have introduced to understand the organization of criminal crimes has been seen for some scholar as a paradigm change within the crime literature (Klerks 2001). Moreover, the network paradigm has been appropriate to study the role that globalization plays on crime behavior because the openness of global trade, travel, communication, and capital markets also globalized criminal activities giving additional relevance to the understanding of crime as network structures. At the description level, the concept of criminal networks has been useful, first, to understand the actual working of criminal activities like drug trade that occurs in the interconnection among small groups (e.g., wholesalers, retailers, money launderers, brokers, processing labs, farmers, etc.) that expand and dissolve quickly in reaction to the level of demand and policing controls; second, to identify key players in the web of criminal ties; and, third, to develop new policies to work with communities in which crime is prevalent.

## Strengths and Weaknesses of a Network-Based Conceptualization of Crime

The age-old controversy between nature and nurture has its own version in the study of criminal behaviors. Early biological theories dominated since the 1890s to the first quarter of the 1900s. Those views were founded on Darwinian approaches to inheritance and natural selection (Lombroso-Ferrero 1972). Later, sociologically based theories emerged, being Sutherland's

differential association theory particularly successful (Sutherland 1939). Against the common belief at the time that understood criminal behavior as innate, Sutherland showed that criminal and noncriminal behaviors are founded on socialization processes, such that the differences between criminal and noncriminal activities are explained by the social interconnection that different individuals select and are exposed to. Therefore, the probability that a person does criminal-like behavior depends on the relative acceptability of stimuli favorable to law breaking with respect to stimuli favorable to law abiding. Criminal networks play a role on the development of those alternative visions about the law. Individuals with a criminal record whose social connections are saturated with gang members have less positive opinions of laws and authorities than those with less criminal alters in their personal networks (Papachristos et al. 2012).

Initially, scholars found in the idea of a network a natural way to describe the sociological approach proposed by Sutherland. Inspired on it, an ethnographic methodology based on case studies emerged as a way to observe and keep records of dyadic interchanges between pairs of criminals. Those studies describe criminal activities as criminal networks but do not necessarily attempted to theorize on their eventual networked-based governance structures. Indeed, a network conceptualization is not the only way to develop a bottom-up approach. Pires et al. (2016) show that illegal parrot trades in Bolivia and Peru are mostly composed of freelance operators interconnected in ongoing illicit actions, but they do not share a formal structure that linked them. For Pires and coauthors, it is better to describe those illegal parrot trades as crimes that are organized rather than organized crime. In the same venue, Felson (2009) suggests that criminal behavior is feed by convergence of potential offenders in the same places. For Felson, the meetings between potential co-offenders would be the foundation for committing crimes; hence, he suggests to focus the attention on the dynamic of those places where they meet and build relationships. From this perspective, Felson suggests a four-level classification of crimes based on size and complexity of the criminal cooperation: primordial clusters of offenders, small-scale charismatic leadership, medium-scale patrimonial system, and extended patrimonial system of illegal cooperation. Although, Felson's approach has clear similarities with a network-based theory, the concept of criminal networks plays no role in his approach.

Others, prominently Carlo Morselli, have move the analyses of dyadic relationships one step forward into a research agenda on crime fully based on a network approach. Such approach claims that patterns emerge from the interconnection of co-offenders that might not be clearly observed by particular individuals, but nevertheless frame their collaboration. For instance, in a set of dyadic relationships between co-offenders, some will have more partners and will become more central in the flow of communications and resources among group members. As a consequence, the relative position of individuals in web of criminals will reflect their relative involvement within criminal activities; moreover, such informal structures may or may not be similar to eventual formal structures that the group might have. Consequently, empirical implications can be tested on individuals' involvements in criminal activities based on their relative position on criminal networks. For example, using records of drug dealing of a group named the Quebec's Hell Angels for which it was also known its formal hierarchy, Morselli (2008) finds evidence that those members with higher level of participation in criminal behavior were more central in the interaction with other members but were not necessarily of higher status in their formal structure.

One key aspect in which a network-based approach to organized crimes has produced new explanations to crime is in the understanding of the governance mechanisms within criminal groups. In a hierarchy, there is a command line of authority, while in a network that command line is absent. That raised the question on the mechanism that makes organized crime possible in the second case. The sociological literature provides theoretical foundations to fill into that inquiry. For example, the development of trust among networks of co-offenders can be understood as a form of social capital (Von Lampe 2009). That

social capital emerges in the social interaction among potential co-offenders as part of their social life. Therefore, the prospect of a joint venture in a criminal activity is embedded in that web of relationships in which individuals are already belonging. While the early studies of criminal behaviors used to accuse some cultures and kinship origin as the source of crime, with the development of the concept of trust, the sociological literature was revealing one possible inner mechanism explaining why some crimes appeared to be associated with a particular ethnic origin. For example, drug trafficking strongly rests on interpersonal networks based on family ties, friendship, and geographic and professional ties; on one hand, trust and reciprocity within those networks help to recruit new participants, to increase the cost of deviant behavior, and to facilitate knowledge sharing and learning (Kenney 2007).

Nevertheless, some warnings must be in place on giving too much credit to the concept of trust as an inner mechanism explained organized crime. For instance, the concept of trust is still vague enough to reveal the mechanism allowing cooperation between potential co-offenders because it can refer to either an irrational decision by some of them who simply trust on others or a rational expectation on other people's behaviors. On the other hand, trust may be referring to personal trust or institutional trust. In the first case, the cooperation is based on a face-to-face relationship between potential co-offenders; in the second case, the legitimacy that they give to their social context is enforcing their cooperation. In both cases, the dynamic of co-offenders' cooperation may be different depending on what the source of the mutual trust is (Von Lampe and Johansen 2004).

Finally, the fact that two individuals expect to trust each other because they become from the same root and, eventually, share some honor codes does not guarantee that opportunistic behaviors will be under control. In this point, an important concept came from the economic analysis of organizations. The transaction cost school in institutional economics makes a link between individuals' motivations and the origin of organization. Individuals must choose between to cooperate with others in the making of an activity and to trade in the open market. The decision depends on the relative costs of "make" versus "buy." In the case of criminal activities, open markets are not available by the nature of the exchange. This increases the relative benefits of cooperation and, consequently, gives a rationale for the fact that most criminal activities are made by groups rather than by solitary criminals. However, the benefits of cooperation are not suffice to guarantee that individuals will commit to their responsibilities in the production of a crime. There are counterincentives to cooperate as well when others make efforts that benefit the group, for instance, there are incentives to avoid costs and to keep a bigger share of the benefits hiding them from the co-offenders. Consequently, the success of criminal groups depends on the way that they make their relationship commitment proof. The economics of organization provides some guidelines to specify the required governance structures for that end. It is in this point where violence plays a role within criminal organizations because the credible threat of suffering a punishment discourages behaviors that are undesirable from the point of view of the criminal group. Nonetheless, violence is not the only possible credible threat. In the case of criminal networks, trustworthiness is a key factor. Hence, failures to fulfill expectations can be punished as reputation losses within the network connecting co-offenders, such that other members reduce their desire to deal with the untruthful partner. Hence, the networks provide enforcement mechanisms that reduce opportunistic behavior making the cooperation in criminal activities possible.

Although the network approach has earned its place in the study of the organization of crime, some limitations must be highlighted. Adopting a bottom-up approach can effectively show hidden organizational structures in criminal groups, but without a clear theory or criteria about when to stop connecting individuals' ties, it would be possible to oversize the relevant criminal network. On the other hand, if some important ties are missing, the revealed network can give a wrong understanding of the actual criminal one. That might happen both as a consequence of latent ties that

are not easily observed but play key roles in the network and as a consequence of the time frame of the observation. Although this is a limitation inherent to all research based on network data, it is exacerbated on the study of crime given the secrecy involving criminal behaviors (Campana 2016). Last but not least, there is also a challenge in terms of the interpretation of network data. Given that individuals have different and multiple roles within networks, their relative relevance in a network structure will be a function of the ties selected to build the network data (Rostami and Mondani 2015).

## The Methodology of Network Analysis Applied to Criminal Activities

Mathematically speaking, a criminal network is a graph, $\Gamma = \Gamma(N, L)$, composed of two types of elements. A list of potential offenders, $N = \{n_1, n_2, n_3, \ldots n_k\}$, where $n_i$ represents individuals $i$ and a list of the dyadic relationships among them, $L = \{l_{12}, l_{23}, l_{31}, ..\}$, where $l_{ij}$ represents the link between individuals $i$ and $j$ (typically, $l_{ij} = \{0, 1\}$ where 0 represents the absence of a tie between individuals $i$ and $j$ and 1 represents its existence. Graph theory is the mathematical branch of network theory that studies the structural properties of networks. And social network analysis is the methodology that has found and proposed meaningful connection between those properties revealed by graph theory and sociologically relevant concepts like power, status, and trust. Most of the social network literature on crime is focused on the understanding of the composition of those structures and the relative positions of individuals within them. Also a promising branch in the intersection between the social network and the rational choice literature has been growing recently (Calvo-Armengol and Zenou 2004).

For instance, some criminal networks are associational networks that emerged from closed personal ties made during prison times, or during the childhood, or during individuals' mutual belonging to a given community, neighborhood or social group. Those ties give life to associational criminal networks embedded in social relationships in which a form of mutual trust was already present. Consequently, trust can be understood as a resource, namely, a form of social capital, bonding offenders together and making their cooperation possible (i.e., reducing transaction costs and discouraging opportunistic behaviors). It can be expected that the more frequent and more intense the ties among groups of potential co-offenders are, the greater the trust that they can build. Consequently, the denser the graph representing their relationships (it means the higher the links connecting them), the bigger their mutual trust. Therefore, social network analysis suggests that we should expect that denser groups have higher bonding social capital. On the other hand, given that individuals use to make bonds with others like them, we should expect high levels of homophily among criminal groups (e.g., in terms of racial origin or crime profiling).

Social network analysis helps to understand individual's differences within groups too. It can be expected that network's members who personally sustain closer ties with other members will be more central and trustworthy. There are several structural measures in social network analysis to represent those differences among individuals (Schwartz and Rouselle 2009). They shed light on different aspect of bonding social capital. Three of the most frequently used measurements are degree centrality (based in the relative number of closed ties that each member has), eigencentrality (based in the relative structural relevance of the ties that each member has), and closeness centrality (based on how close or far each member has the other members in the network). In sum, bonding capital is one reason why many criminal groups are associated with kinship and are informal in nature, given that members have a long-standing learning period of common beliefs and social norms that sustain their cooperation.

Bonding social capital can help to understand some criminal activities in which, for example, trust may be assumed within clusters of individuals. However, there are also criminal activities made with the explicit purpose of gaining profit among individuals lacking a shared past. In those circumstances, offenders' mutual dependence is

based on the success or failure on producing current profits, and it is not embedded in any prior social relationships among them. Therefore, while trust can solve cooperation problem within well-established groups, it is unclear how cooperation problem will be solved within individuals belonging to different clusters. But criminally useful social ties are not limited to bonding ties. Social capital is not only based on closed personal ties; on the contrary, weak ties are also key resources through which reputation and other forms of relevant information flow in the criminal network (e.g., about potential co-offenders). Given that network's members with good and bad records of past cooperation will face different prospects of profits in the future, the access to timely and accurately information is an important resource to decide with whom to cooperate to make criminal-based profits. Hence, networks' members who are a channel of communication among separated clusters in the network will have better information and will have a different form of social capital known as bridging social capital. As in the case of bonding social capital, there are structural measures to represent bridging social capital as well, being betweenness centrality the most common of them. In each of its several versions, betweenness centrality provides a metric of individuals' relevance in the flow of information among separated parts of the social graph.

Finally, the maintenance of social ties requires the investment of time. Therefore, there is also a question on link formation and network dynamic that impact the structure of a criminal network. Denser networks might be better suited for the success of criminal cooperation where mutual trust and secrecy are crucial. However, given that the density of the network rests on the redundancy of members' ties, those networks are time-consuming. Hence, there is a trade-off between the security of the network and its efficiency. This is particularly relevant for co-offenders whose main link is founded in profit making rather than a shared long-term relationship. Consequently, the social capital can not only be a condition for criminal cooperation (either bonding or bridging social capital) but also a function of the purpose of it (Morselli et al. 2007).

The measurement of the density and homophily and the several measurements of centrality in criminal networks help to understand criminal networks' composition. Other useful measures are provided by social network analysis to identify subgroups or communities within large networks, ego networks around particular subjects, and its level of clustering, among others. On the other hand, other concepts and techniques are required to study the dynamic of link formation and destruction among potential co-offenders (Berlusconi et al. 2016), the ways in which peers influence each other in the development of habits like drug consumption (Kirke 2006), the ways in which diffusion happens in criminal networks (Korobow et al. 2007), and the reconstruction of hidden criminal networks from massive data (Ferrara et al. 2014), among others.

## Final Remarks

Criminal network is a concept within the study of the organization of criminal activities. It shed light on the governance structures of co-offenders' cooperation, and it connects several literatures from the social science, graph theory, criminology, and, recently, data science. Currently, criminal network is at the core of an interdisciplinary and quickly growing scientific venture.

## Synonyms

Complex systems and crisis; Network governance and crisis

## Definition

The study of crisis and governance management examines the ways through which the interconnections between the public, private, and nonprofit organizations are managed in the presence of high levels of uncertainty determined by a common threat and a sense of urgency.

## Introduction

Over the last two decades, the public sector has been affected by deep and radical changes, which have in part contributed to its complexity. In the public sector, complexity is the result of the increased connectivity among organizations such as public, private, and nonprofit, at different levels (local, national, and supranational) in policy and service delivery (Boin et al. 2014). The different roles played by citizens referred to as stakeholders, evaluators, issue framers, and collaborators (Epstein et al. 2006) add to this complexity. Further adding to the complexity are external factors such as the economic, social, and legal environment. The impact of these elements on society leads to a system in which outcomes become the result of the interaction among multiple organizations. In such interactions, the responsibilities of each participant are not clear. Thus, when we think about crisis and governance management, we need to think about how public, private,

and nonprofit organizations are interconnected. Connections between organizations are important because a failure in one organization can have a cascading effect on others. For instance, the failure of a financial institution in a remote area of the globe can have effects worldwide. Thus, it could be said that although the complexity of the systems of governance can make organizations more vulnerable, it also represents an opportunity for creating more resilient communities.

This entry provides a description of the state of the art of crises and governance management and discusses future perspectives. This entry starts by providing a definition of what a crisis is. Next, it introduces the challenges of crises and governance management, and finally, the entry discusses future perspectives.

## State of Art of Crises and Governance Management

The term crisis is widely used both by media and in interpersonal communication to indicate situations in which there is a disruption of daily routines. For instance, it is not uncommon to hear about personal, financial, health, and welfare crises. Crisis can occur at different scales such as personal, organizational, and interorganizational, at the societal system level and transboundary. Transboundary crises do not happen within a single jurisdiction, but they impact multiple jurisdictions (Ansell et al. 2010). Examples of transboundary crises are financial crises and pandemics. This entry will primarily focus on crisis that affects systems of governance, that is, a network of organizations. It should be noted that the term crisis is different from the term disaster. Disasters can be the consequence of a crisis; however, not all crises lead to a disaster. For instance, if the Cuban missile crisis in 1962 had not been resolved by the American and Soviet leadership, the result could have been a nuclear war, which would have been a disaster.

A crisis can be defined as a situation perceived by a community as capable of disrupting its core values or generating a threat to essential facilities (Boin and ‘t Hart 2007) under conditions of deep uncertainty. On the basis of this definition, the main characteristics of a crisis are threat, uncertainty, and urgency (Boin 2005). The definition of threat is subjective since it depends on the level of tolerability of the individual or organizations. Threats can be real or perceived. For instance, a looming hurricane or tornado is certainly a real threat; conversely, the threat of reputational damage can be considered as a perceived threat since there is no certainty that it will become real. Uncertainty refers to the unknowns of the threat and to its consequences on the affected communities. Urgency is the main observable characteristic of a crisis since the issue generating the crisis needs to be solved as soon as possible in order to limit damage.

Crises management presents five main challenges, namely, sense making, decision-making, meaning making, terminating the crisis, and learning from it (Boin et al. 2005; Boin and ‘t Hart 2007). The first challenge for crisis managers is to make sense of the event and triggering factors and of who is directly and indirectly threatened by it. Even though sense making may seem an easy task, that is not always the case. Oftentimes, making sense of crises is challenging because of the complexity of intertwined factors, contributing to the event, and also because of the high pressure put on managers to handle the situation in a short period of time. The second challenge relates to decision-making. Once the causes and the consequences of the crisis are known, a decision needs to be made on how to resolve the situation. However, solutions are not always implemented by a single person/organization, but oftentimes, they are put in place by a network of more or less diverse organizations. Fourth, the challenge of meaning making refers to the creation of a shared meaning of the unfolding event. Shared meaning is the creation of a common, and therefore shared, narrative of the reasons for the crisis. In this stage, communication is a very important aspect. In fact, communication management constitutes a significant portion of the effort required in responding to a crisis. The last two challenges of crisis management are terminating a crisis and learning from it. Terminating a crisis does not really look like a challenge because after all it is assumed that the

crisis has ended. However, since a crisis is by definition initially perceived by a set of organizations and their counterparts, it is clear that there must also be a wide perception that the crisis has been resolved. Thus, crisis termination is characterized by both a downsizing of the response efforts and by demonstrating that the generation of the crisis has nothing to do with the organizations involved and that their handling of the situation was done in a proper way in accordance with their capabilities. After a crisis ends, all the participants responding to that crisis should learn from it.

The five challenges of crisis management described above are amplified in governance settings by the network participants' organizations diversity, shared versus centralized authority, and by issues related to the balancement of network efficiency and inclusiveness (Moynihan 2009). The first challenge that networks encounter in managing a crisis is the diversity of the organizations participating in responding and managing the crisis. As the crisis grows, so does the number of organizations with diverse expertise. However, coordination requires that the organizations within the network have experience in working together before the crisis occurs in order to speed up the response process. Thus, it is not uncommon that in order to obtain greater efficiency, new network members tend to be left out (Provan and Kenis 2008). Lastly, authority is another important factor in crisis management in network settings, in particular, in order to make decisions such as how to respond to a crisis, how to disseminate information about the unfolding events, and how and when to terminate a crisis. In network settings, authority is usually considered as shared, meaning that all participants within the network need to justify why their authority should be more legitimate over others.

## Future Perspectives

In light of the amount of novelty crises generate, it is important to take into account how we can train organizations to deal with novelty. As stated in the previous section, crises are characterized by threat, urgency, and uncertainty. During normal times, organizations may choose to prepare for a number of emergencies or crisis through mutual agreement and planning. However, the level of uncertainty generated by a crisis could make planned response activities useless. Thus, it is important that organizations learn how to think out of the box and be ready to improvise if needed. In order to improvise, organizations need to overcome the idea that improvisation equals a failure of planning (Kendra and Watchendorf 2016; Howard and Leonard 2009). Having a plan in place is not a guarantee that things will go smoothly. Planning is not limited to the compilation of a plan; rather, plans should be considered living documents that need to be updated. For instance, strategic actions or measures designed to cope with hazards or threats and risk communications strategies need to be periodically reconsidered. In the words of Henry Mintzberg (1987): "(. . .) strategies are to organizations what blinders are to horses: they keep them going in a straight line, but impede the use of peripheral vision" (p. 31). Thus, crises can also be determined by the unwillingness in being open to change and attentive to the surrounding social and physical environment.

Nevertheless, even when plans are developed and tested, the reality is that there are situations that organizations face that would require improvisation. In fact, the unfolding of a crisis does not necessarily match previous planned response, this is even more true if the threat faced is new. For instance, the 9/11 waterborne evacuation of lower Manhattan was entirely improvised, and planning for it in advance might have been complicated. The 9/11 waterborne improvised evacuation provides food for thought on how to rethink the relationship between planning and creativity and advocates for a change of mind set from considering improvisation as the result of a plan failure to an understanding of improvisation as a means by which to adapt to a changing social and technical environment. In addition, it is suggested that organizations incorporate training for creativity into their planning activities. Even though people tend to be creative on their own, oftentimes their creativity is stifled (Kendra and Wachtendorf 2016; Howitt and Leonard 2009).

## Conclusions

Since threat, uncertainty, and urgency are the main characteristics of a crisis, crises pose a great challenge to governance systems. In a short amount of time, diverse organizations have to make sense of the threat they are facing and act on it. Oftentimes the threat faced is not easily identifiable, and time pressure does not help especially when multiple organizations, not used to working together, need to coordinate and collaborate to find a common solution. Even though governance settings have definitely improved the quality of government in the last two decades, they have simultaneously made entire systems more vulnerable. This vulnerability is due to the deep connections between organizations. Thus, a crisis can quickly spread and involve several organizations. Among all the challenges encountered in managing crises in governance settings, it is not possible to determine which is the most difficult to overcome as every crisis is characterized by different degrees of uncertainty. However, it is imperative for a network of organizations to learn from previous crises since lessons learned can help in being better preparing for the next crisis. In essence, the most important outcome of learning from a crisis is learning how to make systems of governance, organizations, and communities more resilient. Finally, it is imperative that public officials should be trained to deal with not just routine event but also be trained to improvise and foster their creativity to be able to better manage future crises.

# Crisis Management Training

Melissa Pinke
Jacksonville State University, Jacksonville, AL, USA

## Synonyms

Catastrophe; Disaster; Education; Preparation

## Definition

Crisis management is the ability to handle an event that causes a significant threat to the organization that can have negative consequences if not handled properly (Coombs 2007).

## Introduction

A crisis is a turning point, which can have negative effects varying from localized and

manageable to regional and catastrophic depending upon how it is handled. Crisis management describes how an organization's leadership identifies areas of concern and plans to handle them to mitigate adverse impacts. Crisis management ensures that an organization can control events and remain profitable during and after an unplanned, negative situation. Public information management will enable the organization to be seen as trustworthy, compassionate, and ethical. To accomplish this positive outcome, organizations must engage in crisis management training.

## Emergency Management

A good complement for crisis management is emergency management. Emergency management focuses on the four phases of emergencies: mitigation, preparedness, response, and recovery to identify hazards and prepare for them. Some events are not caused by external forces, but are caused by actions or omissions of company employees and problems or failures with products or services or from the public perception of lack of care or concern. Both emergency managers and corporate leadership must be familiar with identifying the types of threats and have the capability to respond appropriately.

### Examples of Good and Poor Crisis Management

In 1982, several deaths were linked to the tampering of the Tylenol brand of pain reliever, acetaminophen, laced with cyanide (Markel 2014). Tylenol sales went from over 35% of the market share down to less than 8% (Markel 2014). Johnson & Johnson dealt with this crisis by using a media campaign issuing warnings and recalling more than 31 million bottles of Tylenol, creating tamper-proof packaging which is now the industry standard, creating a caplet which is less likely to be tampered with, and price reductions for the new pill form. While it took about a year, costing over $100 million dollars, Tylenol was once again trusted by the publics, and sales returned to prior levels.

British Petroleum (BP) was not as lucky. In 2010, 1 of their offshore wells exploded and caught fire, killing 11 employees and pouring oil into the gulf (CNN Library 2016). BP was under-prepared, under-managed, and unconcerned with the well-being of those impacted. One of the most infamous quotes of this century was made by Tony Hayward, BP's CEO at that time, "— there's no one who wants this thing over more than I do, I'd like my life back," while he then went to his yacht race in the middle of the crisis (Merji and De Wolf 2013, p. 79). While BP invested millions in a media campaign to improve their image, they did little to address the lack empathy and compassion to the families of the victims and to the people whose lives were disrupted (McClam and Weber 2010).

### What Is Crisis Management Training

Specifically, crisis management training prepares the organization by the active process of identifying and minimizing severe events to the organization and establishing who will deal with this type of situation and what to say and do in response. This needs to be done in such a way to reduce damage and maintain a positive corporate image. Crisis management training provides the opportunity to identify and correct problems ahead of time before they can become an issue. Staff will also develop and practice responses and work with activating the plan. This process provides familiarity, thus making proper response more automatic.

### Team Selection

When preparing for crisis management training, the process of selecting your crisis response team is just as important as the training itself and should be considered the first step. Identify the key people involved likely to handle a crisis event, and require all of these individuals to attend training. This includes senior management, department heads, human resources, spokespersons, public information officer (PIO), emergency manager, safety officer, head of security, and legal counsel. The safety and emergency managers will already have ideas of actual or potential issues that may create a crisis situation and could suggest ways to mitigate problems and handle complex. Include corporate attorneys to point out other liabilities. However, liability should restrict

communications. It is of the utmost importance to communicate; but choose your messages carefully.

If you already follow an Incident Command structure for other types of events, then that same set up can be used for a crisis as well. Regardless, once a situation is determined to be a potential crisis, a leader, scribe, public information officer, spokesperson, and operations manager are all needed (Weeden 2016). When following chain of command, the leader is in charge and has oversight. The scribe records issues and decisions and collects all information communicated, so there is a trail of decisions and actions. Your PIO monitors the public voice, creates messages, and prepares the spokesperson if messages are going out over audio or visual media channels. Operations manager determines what went wrong and oversees implementation of corrective measures.

### Training Delivery

The training delivery should be delivered in the form of a workshop. A workshop is a way to be actively engaged in the learning and provide ways to identify and respond to a situation. Begin with an introduction as to what to expect and why the workshop is needed. Include a few case studies addressing both successful and not-so-successful crisis management situations. This will provide some background and lessons learned from other organizations and hopefully provide an "ah ha" moment for leaders. Another good way to start is to use a real or fictional business scenario in the community and let the participants identify what should be said and done to ensure safety and reduce apprehension and for the company to maintain a positive image.

A review of the organizations' incident reports can also point out areas of potential problems that could have gotten worse and may be worthy to discuss. If there is a current crisis management plan in place, review what is listed to ensure accuracy and the steps that have been completed, and ensure all aspects and potential negative situations are covered. Then review your organization from the public perspective to ensure you have not missed any potential scenarios.

The next part of crisis management training is starting with mitigation and preparedness by having a team evaluate the organization and determine the internal critical areas that could cause problems related to safety, financial loss, or company reputation. This is a different type of risk assessment, looking at internal actions and mechanisms or internal hazards, rather external hazards. By doing a risk assessment of your full operations, not just your building, critical aspects can be identified.

It is important for the organization at this stage that everyone is honest and identifies what can go wrong related to products and services. Determine the worst-case scenarios the company can face. A site walkthrough can also point out potential areas of concern and will utilize the expertise of safety, security, and emergency management to determine the level of your risks and vulnerabilities, (FEMA 2013). Operations Management, too, needs an open mind to spot and acknowledge potential concerns in their respective areas. A hazard analysis could be applied to these scenarios in order to identify the worst of the worst and prioritize issues to address. Take any steps to mitigate or minimize these problems from occurring in the first place. While all risk may not be eliminated, it may certainly be reduced.

During this process, it is also important to realistically assess if employees will readily and comfortably come forward with potential or actual problems or concerns and if not, determine why and address this. If the potential for delivering bad news will be met unfavorably, employees will not speak up. It is always better to hear potential problems from employees, rather than customers or the media.

In conducting a self-assessment, consider what the current corporate image is. Assess if the organization looked upon favorably or not by the media and public. If not, identify what the issues are and address them. Develop steps and actions to make improvements to the company image now. It is never too late or too early to work on a positive company image.

When potential problems are identified, the next step is to determine what the warning signals are for each situation and how to detect them.

Some warning signals include a decline in productivity or an increase in errors, defective products, or the exposure of potentially sensitive aspects of the organization. It is important to identify a potential crisis as early as possible so it can be addressed quickly, before it gets out of hand. Include these warning signals or triggers in your crisis management plan. Finding problems and solutions is a significant step in crisis management.

The third part of crisis management training focuses more on dealing with response and recovery, when a crisis event is identified and while it is still underway, causing fear, anxiety, or alarm with the public or other stakeholders. This has often been referred to as "being in the hot seat." There are several items that need to be identified and covered in part of the training. This includes the proper chain of command for reporting potential or actual incidents and its importance to be followed during a crisis for damage containment. This may include the already established operational chain of command. Roles and responsibilities must be discussed, clarified, documented, and communicated. Ensure there is a mechanism to alert the crisis team if a potential crisis event is identified. It is much easier to work together as a team from the beginning to address a situation, rather than for it to escalate and then have to backpedal. Determine ahead of time what channels will be available for communication, and ensure they are accessible 24/7 by individuals assigned to use them.

An important part of crisis management training is ensuring participants to use their plan. The plan should be a working document and used as guidance and checklist to ensure critical items are not missed. If there is a plan already developed, participants should review it before the first class and bring a copy with them. Updates should be expected when the plan is reviewed. Someone must be designated to keep track of changes and make adjustments and reissue updates to all involved parties.

### Crisis Messages

Another component in the training is to practice crafting and delivering messages. Effective crisis communication is a central point in taking control, alleviating fear, restoring calm, and creating favorable opinions. Crisis communication messages must be swift and address the needs of various audiences. These messages must first convey sincerity and empathy to those affected. Facts must be given, even if they are unpleasant or unknown. It is ok to say all of the details are not known and do so by stating what is known. Do not lie, speculate, or blame others. Tell what the organization is doing to correct the problem. The goal must be to be open and transparent. At no time should the phrase "no comment" be used (Coombs 2007). Even if you don't have any answers or are unsure of what to release, make a simple statement of "we are looking into the situation at this time" (Coombs 2007). Always make sure any statements made, as well as body language and inflection, show concern, caring, and an active response. Plan to provide updates on a scheduled basis, and use various delivery methods as appropriate: media, social media, and updates on the company web page. Take the time to capture messages and save them as a template with permission to use them when needed. In most cases, some adjusting will be needed, but try to minimize the approval process, keeping it mainly within the crisis management team.

### Delivering Media Messages

Whenever possible, a senior leader should represent the company as the spokesperson, especially for radio or television statements, press releases, or press conferences. Otherwise, another trusted individual from the company is advised. Personal demeanor and professionalism is of utmost importance when trying to convey both control of the situation and care for those impacted. When presenting, avoid reading a statement in order to make it personal. Say something genuine to reflect empathy for those dealing with the problem. Personal image and body language are key considerations to ensuring the message is received as intended, and is the purpose and function of the PIO to assist the spokesperson in this area. Grooming and attire should be discussed, and at all times, a professional representation of the company image must be maintained. When speaking, the spokesperson can be supported by operational

and support specialists, and they can answer questions within their own expertise. Make sure they too have practiced under the guidance of the PIO.

### Information Management During a Crisis

Remember, there are two primary groups of people that must be kept up to date. The first group is company employees. Keeping employees abreast of events and what is being done will ensure the whole organization is on the same page. While employees may not officially make reports to media, they can act as goodwill ambassadors for the company, so ensure they can spread a good word about what is being done, even if it is just the company that is committed to making things right.

The next group of people that need information is the public. The public obtains its information from the media and will form an opinion about the organization and its response based on this information. Therefore it is essential that the public hears the organization's message, hears empathy and a commitment to solving the problem, and hears this message often.

Keep in mind for both groups, ensure the PIO is monitoring for messages to be delivered as intended. If there is miscommunication, rumors, or other issues that surface, the PIO needs to convey this to the leader, along with suggestions to correct the situation. Hearing the concerns of the people and addressing them are just as important as getting information out. Do not let rumors or false information go unchecked.

### Tiered Approach to Crisis Management Training

There are actually two levels of crisis management training. The first includes all people involved in crisis response team. They will go through the process outlined above to identify potential crisis, triggers, and response measures. The second level of training is for all employees. This is a much briefer session but includes awareness about the crisis communication plan, how employees can identify problems or triggers, and whom they should be reported to. The company's policy about employees speaking to the media should also be communicated. Be sure employees know how to respond if engaged by media personnel and whom inquiries should be addressed to.

### Maintaining Skills

As with any low likelihood event, practice will encourage readiness. Conduct regular, frequent sessions on crisis management that includes a different scenario each time, using the hazard vulnerability analysis to identify the priorities. The more comfortable individuals are at performing a task and working with both the plan and the team, the better they will do. Due to the high stakes of a crisis event, ensuring your crisis management employees work together as a team is critical. Everyone must feel free to speak up without repercussions and develop trust in each other.

### The Crisis Management Plan

The crisis management plan should maintain all important information. Specific response measures, staff roles and responsibilities, and other actions and methods of message delivery should also be included. This document should be reviewed frequently in order to ensure controls are effective and determine if other potential troubles arise.

### Media Relations

While it is not a direct part of training, the importance of establishing media relations prior to any event occurring is critical and should be covered. This would be a great task for the PIO, and these relationships should be maintained on an ongoing basis. Prior working relationships are a great beginning to handling a not-so-great event. Having a friendly face in the media can make a situation less unpleasant. Positive working relationships with the media also increase the likelihood your message will go out as intended.

### Recovery: Getting Back to Business

Recovery focuses on returning the business to more routine operations. By identifying cues of a problem, reacting swiftly, ethically, and with integrity, normal business operations should soon return. Recovery can often be a humbling and relieving experience. Processes or products may need to be changed; so may policies and procedures. Continued positive public relations and providing information need to continue until no

more questions are asked and all are satisfied and have gotten through the negative consequences.

Preventing this or a similar event is all about learning. Learning begins by identifying problems and solutions. The experience itself should also be a learning event and can be accomplished by conducting an after action review. Identify what worked well and what needs to be improved. Assign responsibility and accountability to corrective actions for operational, procedural, or functional areas and any changes in the crisis plan itself. Hold follow-up meetings to ensure changes are made. Follow up with tabletops or drills to practice and engage people and the plan. This process is cyclic for improvements. The expectation should be for any lessons learned from the event should get incorporated into procedures and protocols to reduce the chances of this or a similar event from happening again.

## Conclusion

Crisis management training is really about helping an organization and its management team to accept the reality that problems can occur, reducing the potential, and preparing leaders to quickly identify a crisis and to act swiftly with the appropriate actions to resolve the problem quickly. While the training should be led by someone knowledgeable and experienced on the topic, the goal is to allow the participants to realize the problems and put together a plan of action steps to take and identify who does what. Training also allows participants to practice and use their plan and skills by responding to various scenarios in order to determine plan limitations and develop skills and confidence. Confidence based on practiced skills and a solid plan will be a driving contributor to successful crisis management.

## Synonyms

Adversity; Calamity; Cataclysm; Devastation; Tragedy; Trauma; Turning point

## Definition

An unwelcome event with negative consequences and various spatial impacts.

## Introduction

Various terms are used in emergency management to define unwelcome events, their size, and impact. All of these events include the sense of unwelcomeness – negative impacts on individuals, families, and communities and some kind of loss – material, psychological, or spiritual. The purpose of this section is to provide an understanding of the nuances of these terms in the field of emergency and crisis management.

## Terminology

Unwelcome events occur seasonally, cyclically, through technological failure or through human error or intent. These events may impact only one person, in which case the event is managed by that person or family. Conversely, some unwelcome events have widespread, regional, or even global impact and require the coordination of multiple actors to manage the event and its outcomes. Specific terms have been developed to impart the differences in impact and severity of these unwelcome events. The four most commonly used in crisis management are crisis, emergency, disaster, and catastrophe. Each implies a different level of impact and a different response requirement.

## Crisis

A crisis is a sudden unwelcome event. It may have natural causes, technological causes, or human causes. A crisis may impact one person, such as when someone has a heart attack. That is a medical crisis for that person, with impacts on his or her immediate family, workplace colleagues, and perhaps community. However, the response system is in place to provide rapid medical response and intervention, often leading to a good outcome for the patient and his associates. However, the event is upsetting, carries significant risk of becoming a greater problem, and in a significant percentage of events leads to tragedy – disability or death for the patient.

A crisis may impact an entire community or region. When a squirrel chewed on a power line in Oregon, power was lost to millions of residents in three states immediately. Those who had prepared for power outages were able to rely on backup generators, battery-operated equipment, and other strategies for managing without electricity. Some businesses had to close early due to the loss of all the systems relying on electricity, including the inability to use credit cards, confirm checks, and operate electronic cash registers. This in turn impacted residents who needed food for dinner, medications, or batteries and other equipment for dealing with the event.

The term crisis is also understood to be any unexpected, sudden-onset event with widespread negative consequences. For example, the financial crisis of 2008 caused a worldwide impact to banking and investments, depressing stock markets around the world. In some countries a high percentage of people became unemployed, while in others the markets for their trade goods shrank, depressing incomes. Some banks went out of business, and some nations tightened banking regulations, changing the cost and availability of credit. Recovery from this crisis required a coordinated international effort to better regulate investments. It took many years, and some economists argue that there will never be a return to the "normal" situation before that financial crisis.

Ultimately the core meaning of crisis is the suddenness of the event and the significant impact of the event on someone or some group of people. It is a life-changing event in some way. The scope may be one person or multiple nations. There may be a plan in place to manage it, and trained professionals to implement the plan, or it may be beyond anyone's capability to orchestrate a response (Edwards and Goodrich 2013).

## Emergency

An emergency is an unwelcome event that prompts rapid action by individuals or organizations. It occurs when either safety or security plans fail or natural hazard events overwhelm normal response capabilities. It may have natural, technological, or human causes, and it may be accidental or intentional. A common understanding of emergency is any unexpected event that causes damage or loss to persons or property. Action is required to lessen the impact, care for those effected, prevent further losses, and limit residual damage.

The scope of an emergency can also vary widely. Emergencies can be very small or enormous. A flat tire is an emergency for a driver on a freeway, demanding immediate responses like changing speed and pulling off the road. If the emergency is managed successfully, the only impact is on that driver. If it is managed unsuccessfully, there may be a chain reaction car accident involving dozens of other drivers. At the other extreme of emergencies, an earthquake is an emergency that generates numerous impacts within a community, region, nation or even global supply chain. The earthquake may trigger additional impacts, like a tsunami wave that travels to other countries, or loss of infrastructure that impacts regions. Successful emergency management is defined as limiting loss of life, speeding aid to the affected populations, and restoring infrastructure and services rapidly. Failure in emergency management can lead to long delays in the arrival of assistance, with resulting human and infrastructure losses.

Unlike a crisis, an emergency need not have a sudden onset. A hurricane may be predicted for days, yet when it finally makes landfall, it will create numerous emergencies in the affected communities. There will be loss of life, loss of infrastructure, loss of response systems and capabilities, and intractable environmental damage. Preparing in advance may enhance emergency response through population preparedness, emergency goods stockpiling, and effective planning and training for first responders in the community.

The term emergency then denotes an event that requires the immediate response of those involved and usually outside assistance from professionals in the community or beyond. Emergencies may be small or large, manageable or intractable (Edwards and Goodrich 2013).

## Disaster

A disaster is an emergency with a wide impact that overwhelms existing emergency plans, leading to a difficult or failed response. An emergency becomes a disaster when in the initial hours the response fails in some aspect. It may be a failure of the planned response because of the size of the event or the unexpectedness of its impact. The progression to a disaster may reflect a failure to plan for that kind of event at all – what Congress call a "failure of imagination" in the response to Hurricane Katrina, for example, since the failure of multiple levees along Lake Pontchartrain was not anticipated.

A disaster is also defined by the scope of its impact. It damages multiple segments of a community, multiple communities, or even whole regions. The widespread loss of property and failure of infrastructure leads to a disrupted response and protracted recovery period. Disasters are community events, not individual events.

Disasters require the rapid response of multiple professions. Police and fire personnel provide search and rescue and medical care for victims. Transportation personnel remove debris and open roads so emergency response vehicles can reach affected areas of a community. Public work personnel repair critical infrastructure like drinking water systems and wastewater systems. Multiple professions are coordinated through the community's emergency response plan and its emergency operations center.

Assistance will generally be required from surrounding unaffected jurisdictions. Mutual aid systems within a state are designed to coordinate response from unaffected countries within that state – and the Emergency Management Assistance Compact in the United States – and similar systems in other nations enable professionals from other states to be deployed to assist the disaster area. Help from the federal/national

level may be required, with resources of the central government sent to assist the impacted jurisdiction. Often federal/national financial resources will be essential to help with emergency response costs and immediate services like emergency shelter for the population.

Disasters, however, remain manageable with the addition of outside resources. Mutual aid and national-level funding augment local capabilities to bring about a lessening of the impact on the population and a rapid rebuilding of the community that leads to recovery. Communities that have withstood disasters like the Loma Prieta earthquake or Hurricane Andrew can rebuild and recover within weeks to a few years (Edwards and Goodrich 2013).

## Catastrophe

A catastrophe is an emergency event that overwhelms not only the local emergency plans and resources but also makes federal-/national-level response difficult. It causes widespread or economically significant damage across multiple jurisdictions and requires outside assistance, including national-level aid or international support. The challenge may be due to the unexpectedness of the event or the widespread areas of impact, as with the 2004 tsunami in the Indian Ocean. It may be impacted by unplanned-for factors like the presence of tourists with no experience of the area and limited local language capability. The impacts may be intractable, as with the loss of coastal land to the storm surge.

A catastrophe will strain internal responses for all but the largest and wealthiest nations. The extreme extent of the damage will make economic recovery difficult, damaging the tax base of the affected nation and depriving the central government of the means for response and recovery. Disaster assistance will have to come from the community of nations, international and nongovernmental organizations (NGOs). Emergency responders like search and rescue teams, search dogs, and medical assistance must often come from other nations.

The long-term impact of a catastrophe may include destruction of local economies. Slow recovery due to lack of funds for planning and rebuilding leads to loss of tax base, loss of income for the victims of the disaster, and long-term health impacts for the nation. The 2004 Indian Ocean tsunami killed 320,000 people and injured 1 million more in 11 countries from Africa to Thailand and Indonesia. The tsunami left the local fishermen without their boats and equipment, the ports were destroyed, and their former village areas were washed away. The disaster killed a number of tourists and destroyed beachfront hotels, damaging tourism for years. Recovery has led to disputes between the villagers who want the land next to the shore to replace their land that was washed away and the planners who caution against reconstruction in what they view as a dangerous place. Other villages fight with developers over the use of the shorefront for fishing villages and ports or tourism.

In the aftermath of the 2010 Haiti earthquake, over 100,000 people were killed and 3 million displaced. Haiti found its capital in ruins, with a loss of trained government workers in the building collapses. With Haiti already dependent on many NGOs for social services, after the earthquake the international community was essential for any meaningful response and recovery work. For example, the airport at Port-au-Prince was an essential link for the delivery of emergency supplies, but its air traffic control tower was destroyed and its personnel were with their families. The US Air Force had to land personnel there with a battlefield command post vehicle to provide air traffic control so emergency aid could be delivered. Israel sent a complete military field hospital to provide emergency medical care for the victims. This was tied to the US hospital system by the US Air Force that took the injured needing surgery and advanced orthopedic care to Miami's medical centers. Unfortunately, many of the injured needed protracted care that could not be delivered in their ravaged home country, so they have remained in US Gulf Coast cities, while their rehabilitation continues.

Unfortunately, the essential outside aid also come with some problems. The loss of many

government workers meant that Haiti did not have a strong emergency response internally and little capability to coordinate the outside aid that began to arrive. The international NGOs were often reluctant to share the scarce tarmac space at the airport and provided a challenge for the US air traffic controllers. Well-meaning donors sent response and recovery equipment, only to have it sit in the airport customs facility because no one had the funds to pay the customs duty on the donated goods, and the Haitian government demanded not only the customs duties but also storage fees, while it was impounded for lack of customs duty payments. Worst of all was the introduction of cholera to Haiti by a UN assistance team from Nepal. Haiti had never had cholera, but the Nepalese used a major river for latrines, bringing the disease to the environment. By 2016 the UN admitted responsibility for the introduction of the disease, 10,000 people have died from this secondary catastrophe, and over 800,000 have been made ill. To eradicate this legacy of the earthquake response will require not only a mass vaccination program but also the introduction of modern drinking water and sanitation systems. Neither the UN nor Haiti can currently pay for either of these recovery requirements (Edwards and Goodrich 2013).

## Conclusion

Unwelcome events occur as a result of natural, technological, or human-caused actions. These unwelcome events may have an unexpected and immediate impact on one person or millions. They may impact one person or town, or nations on two continents. Affected nations may be able to respond and recover independently or may require multinational assistance to save lives and develop some level of recovery. These various levels are named crisis, emergency, disaster, and catastrophe, reflecting the speed, nature, and scope of the event. Students of emergency and crisis management should use care in selecting the proper terms to discuss events and present their research.

## Synonyms

Built environment; Framework; Supporting systems, Assets and networks

## Definition

Systems and assets, whether physical or virtual, are so vital to the society that the incapacity or destruction of such systems and assets would have a debilitating impact on security, national economic security, national public health or safety, or any combination of those matters.

## Introduction

Modern societies are supported by a network of systems that provide the services essential to sustain human life, support socioeconomic activity, and provide security. While these systems provide

high levels of convenience and quality of life, they also create vulnerabilities, since the established social order depends upon their functionality. Members of the society can plan for brief interruptions of these systems through stockpiling, temporary alternate modes of operation, or foregoing the related activities for short periods of time. However, longer-term loss of these systems can damage the society's public health, economy, and security.

In most nations the critical infrastructure elements are mostly owned by the private sector: individuals, firms, and corporations. Governments may regulate service charges and delivery and may mandate a level of preparing for outages, but the private sector ultimately has to undertake the investment to make these actions possible. Explaining the value of these steps and the long-term return on investment (ROI) that they will generate is a challenge in growing economies and a losing proposition in times of economic downturn or in societies without increasing revenues to protect. The government's goal for critical infrastructure is to develop a society "in which physical and cyber critical infrastructure remain secure and resilient, with vulnerabilities reduced, consequences minimized, threats identified and disrupted, and response and recovery hastened" (USDHS 2013, National Infrastructure Protection Program).

## Defining Critical Infrastructure

### Source of Definitions

Critical infrastructure has been defined by national and international norms and regulations. For example, in the United States, there have been many documents issued from the Executive Branch of the government that define critical infrastructure, such as presidential executive orders like HSPD-7 (Bush 2003) and PPD-21 (Obama 2013), and descriptive documents created by executive branch agencies. There are 16 economic and social segments that have been identified by these documents, and they form a useful paradigm for understanding and evaluating critical infrastructure internationally.

**Critical Infrastructure and Crisis Management, Table 1** Critical infrastructure sectors

| | |
|---|---|
| Chemical | Financial services |
| Commercial facilities | Food and agriculture |
| Communications | Government facilities |
| Critical manufacturing | Healthcare and public health |
| Dams | Information technology |
| Defense industrial base | Nuclear reactors, materials, and waste |
| Emergency services | Transportation systems |
| Energy | Water and wastewater systems |

*Source*: USDHS (2016a)

Table 1 lists the sectors that are commonly considered to be critical for the functioning of civil society and the provision of national security. While government has a security interest in their operation, according to the US Government Accountability Office (GAO), 85% of the critical infrastructure in the United States is privately owned. The owners generate income for themselves, their employees, and the community while providing essential services. Short-term disruption of CI will have immediate economic impacts, but longer-term loss of these systems may have national security implications.

### Features of Critical Infrastructure

Critical infrastructure (CI) is made up of the physical and cyber elements that support normal activities, like transportation, communication, and public health. CI is comprised of physical assets, socioeconomic activities, and information creation and sharing. These elements are complex and interconnected, often in unexpected or unrecognized ways, and the failure of one may cause a cascading effect through the society. For example, water, power, and transportation are linked, so that failure of the transportation system may prevent the delivery of chemicals needed to treat potable water, or the lowering of the water level in a river may deprive the hydroelectric plant of flow to turn its turbine or deprive the gas-fired plant of the water to create steam to turn its

turbine, while a flood may destroy the power plant and the roads.

Damage to the CI may be caused by poor initial design, operator error, or physical destruction by natural or human-caused accident or intent. Therefore, the owners undertake mitigation steps to prevent or lessen the damage to their facility or system. Building codes for CI structures create resilience to damage, lessening the actual damage experienced or speeding recovery. Such mitigation may include value engineering, which goes beyond the minimum life safety codes for construction and builds in a level of protection that prevents disruption at all. For example, hospitals in high seismic activity zones are built with stronger and more flexible components to ensure that the hospital remains in service, even if the community experiences widespread damage. A nuclear electrical generation station would have alternate on-site sources of power available to keep its cooling water circulating and its security-based access systems functioning, even if the normal community power delivery system is disrupted.

CI may be damaged unintentionally by natural hazards or accidental errors in operation or through intentional damage and disruption planned by disgruntled employees or terrorists. Effective mitigation and prevention based on engineering standards can be created to protect CI when the unintentional events occur. These strategies for mitigation or prevention are based on an evaluation of risk through design flaws or human error, and safeguards are developed either to prevent the event or to limit the extent and duration of the event. For example, roadway bridges are built to withstand earthquake-generated shaking without significant damage, allowing the road to reopen quickly. Bridge supports are built with the ability to absorb the energy from being hit by a truck without buckling. However, it is very difficult to design CI to prevent or withstand intentional attack. Those planning the attack can do the same engineering risk evaluation as the designers and seek vulnerabilities inherent in the CI. For example, fiber-optic cables that serve regional communication systems are laid below ground level in protected conduit, and the connections are secured in a locked vault, which prevents tampering by vandals. However, disgruntled employees with knowledge of the system and its security design can destroy the lock on the vault and cut the cables at their most vulnerable location to create the largest possible communication outage, denying the community access to the emergency services they may want to summon.

While post-event damage assessment reports are the key to recovery, they also represent a vulnerability. Most governments mandate the development of a damage report after a disruptive event to a CI sector element in order to understand the failure point and evaluate how to prevent such a failure in the future. Therefore, the reports are usually detailed and self-critical, revealing the failure point for this event, as well as assessing other aspects of the structure or technology that could have failed or almost failed. These damage assessment reports are critical for the development of better designs and mitigations, but they also provide a blueprint for an intentional disruptive act. A terrorist learning that a building could not have withstood another 10 seconds of earthquake-induced shaking could better calculate the amount of explosive needed to destroy that building. If the building were a telephone switching station or a power plant, the community impact from the loss of the building could be long-lived and disruptive to the community and even to national security.

Reports that detail the cause of the damage, the extent of the damage, and the repair effort for the CI facility are especially sensitive. Therefore, the damage assessment plans must be treated as confidential documents, even classified as top secret for facilities whose vulnerabilities could be a national security threat. While private building owners have property rights that can allow them to refuse to reveal the contents of a report, some buildings or activities are considered under government jurisdiction, and information about them is inherently in the public domain.

Loss of CI may have a debilitating effect on public health and safety, on the national and even international economy, and on national and international security. Therefore, the central government has a direct interest in the development of

emergency response plans for the CI facilities, including appropriate prevention and mitigation activities, and plans for rapid system recovery. The government, in turn, will be relying on the systems, assets, networks, and services that the owners of the CI provide to maintain the civil society and the ability to defend the nation, especially in times of crisis (USDHS 2016b).

### Public/Private Ownership Challenge

In the private sector the CI facilities represent large capital investments. These facilities are intended to operate at a profit for the stockholders. When government regulations change the standards for management, storage, transportation, and use of components and products because of their role in the economy or in community safety, these extra costs are borne by the stockholders and consumers. Private firms often resist additional regulations because of these costs, but those owning CI have a unique need to consider continuity of business operations because they are not only the private owners of products, services, and systems but also the purveyors of these essential supplies, services, and systems to the community. The continuity of their business operations may be critical to life safety, as with medical devices and pharmaceuticals, or to the security of the nation, as with the manufacture of defense supplies. Balancing reasonable regulatory costs and community safety and security needs requires a collaborative relationship between government regulators and private sector firms.

Finding the appropriate balance between cost and regulation involves risk management. According to US DHS, the elements of critical infrastructure can be divided into physical, human, and cyber. These are intertwined operationally, and often their synergy must be considered in risk assessment. The threats to these elements of CI come from five identified potential sources: extreme weather, accidents or technology failures, pandemics, cyber threats, and acts of terrorism. The risk analysis sets goals for the CI in preventing and protecting against these threats, identifies the elements of the CI that are at risk, analyzes the risk to the CI, determines what risk management activities are reasonably likely to be effective, and creates measures to determine the value of the ROI for various levels of risk avoidance investment. (Government Accountability Office 2010). The CI owners, often in collaboration with the government, will make appropriate investments and monitor their success, from the perspective of the stockholders and the community. (Government Accountability Office 2006).

## Types of Critical Infrastructure

### Chemical

The chemical sector has five main subdivisions: basic chemicals, specialty chemicals, agricultural chemicals, pharmaceuticals, and consumer products. All of the elements of this sector manufacture items that are important to consumers for health and quality of life, to farmers for the production of food, to manufacturers as raw materials, and in the global supply chain as components of finished products or elements that contribute to the creation of those products. Most of the sector members are private sector corporations, some with government contracts to make defense-related items.

The chemical sector participates in many levels of the economy. Basic chemicals contribute to the manufacture or processing of many other products. Chlorine is an essential element in drinking water processing. Oxygen is used in manufacturing processes and as a medical gas. Agricultural chemicals include fertilizers and pesticides. Pharmaceuticals contribute to human and animal health. Hair dye and plastic cooking utensils are made from chemicals.

Commercial and military explosives are also made from chemicals, as are poisons and other items whose toxicity is incidental to its use and must be controlled. Cyanide is used in metal plating, for example. Because of the potential lethality of these chemicals, their manufacture, use, storage, and transportation are regulated by a variety of national and international government agencies. Some chemicals that are benign and useful individually can become lethal when combined, such as ammonium nitrate fertilizer and fuel oil, which when combined becomes ANFO, the

powerful explosive used to destroy the Murrah Building in Oklahoma City in 1995. Because of the potential damage that can be done by misused chemicals, governments may mandate special regulations for the custody and storage of these extremely hazardous materials. Operational security and physical security provide the best options for protecting this sector.

### Commercial Facilities

The commercial facilities sector includes locations that draw large crowds. The main subdivisions are entertainment, gaming, outdoor events, lodging, shopping, public assembly, real estate, and professional sporting leagues and federations. They are operated to make it easy for the public to access the activities there, sometimes with no limitations on entry, as at shopping malls, while others have ticking or security elements that permit the collection of some limited information on the users. They are critical elements of the local and global economy, housing the retail and corporate business elements, and entertainment.

The commercial facilities sector participates in many levels of the economy. They generate real estate tax and sales tax for the local and state governments and corporate income tax for the federal government. These venues enable many members of the community to earn a living and in turn pay income and real estate taxes. Thus, their role in the economy includes both the local private wealth creation and government taxation collection. They also impact the global supply chain through international and transnational corporations directly as owners or tenants and as part of the global supply chain that relies on these companies as suppliers of intellectual capital or consumers of their products.

Large-capacity open facilities are vulnerable to a variety of threats. Like the rest of the community, they have to plan for natural and technological unintended events like power outages or hurricanes. However, their large populations have also been attractive to terrorists for attacks. Among the most famous examples of such attacks are the World Trade Center office towers in New York on September 11, 2001, the Dolphinarium nightclub in Tel Aviv in 2001, and the attacks in Mumbai in 2008 that included the Taj Mahal Hotel, a café, and a cinema. The large populations provide the opportunity to create many victims, and the open nature of the buildings makes prevention very difficult. Security guards, metal detectors, explosive sniffing dogs, closed-circuit TV cameras, and undercover law enforcement teams have been used in various venues to deter, detect, and interdict hostile actions.

### Communications

Communications is both a critical infrastructure in itself and also an enabling element across all the other aspects of CI. The sector delivers voice, data, and wireless services using a variety of technologies, including land-based transmissions, satellite-based transmissions, and wireless methods. Communication systems include telephone, cell phones, one-way and two-way radio, television, pagers, Internet services, and many other technologies. With the development of the Internet of Things, even refrigerators and alarm systems have become part of the intertwined communication system. Most people use several of these communication technologies every day to get news, access traffic condition data, make business contacts, and send documents and messages. The systems support all types of commercial and industrial activity, as well as entertainment and friendship. While regulated by the government, most systems are owned by the private sector.

The communication CI makes rapid communication of information possible. Community members can contact emergency services for assistance. Businesses can contact customers and suppliers. Access to global stock market information influences investment decisions. The speed and accuracy of video feeds enable doctors to diagnose patients who cannot travel to medical centers and recommend treatment immediately. People in Ghana can use their cell phones to get market prices and product availability to conserve their time and money when shopping for kerosene or selling their produce. The benefits of inexpensive and immediate communication flow through most socioeconomic levels around the world.

Society's dependence on communications is this sector's primary vulnerability. If the means

of communication fail, the community impacts are ubiquitous. Hurricane Sandy damaged the sector's CI in New Jersey, preventing people from calling for assistance with evacuation. An intentional denial of service attack against a communications fiber-optic vault left two communities without any kind of phone service, including no 9-1-1 service, and hospitals without internal or external communications. While all communication CI owners take precautions against intrusions and attacks, the complexity of the system and the multiple elements of the networks make developing highly reliable protection for the networks and systems impossible. When cyberattacks from anonymous sources are added to the vulnerability matrix, it is clear that only redundant, unconnected systems like amateur radio are likely to withstand concerted attacks.

## Critical Manufacturing

Critical manufacturing includes four subsectors: primary metals manufacturing, machinery manufacturing, electrical equipment, appliance and component manufacturing, and transportation equipment manufacturing. This sector not only supports other manufacturing and assembly activities, and supplies consumer products, but also provides an industrial backbone to support a rapid increase in production of defense equipment. Many consumer goods come from this sector in whole or in part. It is predominantly made up of privately owned corporations, many with international elements such as raw materials extraction.

From transformers for trains to sports cars, this sector meets the needs of a wide variety of activities and of other CIs. This CI provides the components for much of the rest of the US industrial base, provides the elements for logistics capabilities – trucks, trains, and ship motors – and also creates many consumer products, from refrigerators to airplanes.

The critical manufacturing sector is vulnerable to the same unintentional events as the whole community. Floods and hurricanes have damaged factories. It is one of the unionized segments of the economy, so this sector is subject to strikes and labor unrest. Its critical place in the global supply chain would make it attractive to criminal activity and terrorism, but a high level of security is possible at most CI facilities of this sector. The facilities are not open to the public; employees are generally badged and often uniformed. Facilities are gated and generally have security guards and cameras within the property. However, the continuing theft of materials from manufacturing facilities makes it clear that with so many workers and so much materiel in transit from initial development to finishing, perfect security is not possible. Physical and operational security protocols can protect the facilities, and inspection and customs sealing protocols provide some protection in international transit. Truly critical elements may be moved by the military for better protection from tampering and theft. Cyberattacks against critical manufacturing operations and cyber theft of intellectual property are added threats that must be countered through the development of cyber defense software, systems, and protocols. This sector is particularly attractive to thieves and potentially to terrorists.

### Dams

The dam sector is a complex and highly interconnected part of the CI. Dams provide hydroelectric power generation, municipal and industrial water supplies, agricultural irrigation, sediment and flood control, river navigation for inland bulk shipping, industrial waste management, and recreation. Water from dams is used to irrigate 10% of American crops; dams offer flood protection to millions of people around the world; and according to the World Energy Council, more than 160 nations generated hydroelectricity using dams. Dams have direct relationships with many of the other CI sectors, such as agricultural irrigation mentioned above. Electricity and communications systems are used to remotely manage dam operations. It in turn provides electricity generation. The lock systems in this sector enable the movement of goods on inland waterways. Reservoirs behind dams are an important source of drinking water around the world. About half of American dams are privately owned by farmers,

water companies, and energy companies. Ownership rules vary around the world.

Dams protect communities from normal rainfall-induced flooding by impounding water for later safe release. The water behind dams provides drinking water for communities, habitat for wildlife, and water sports venues. Some dams were built for flood control, some for hydropower generation, and others for private purposes like irrigation of farmland.

Dams and their impounded water are vulnerable to unintentional damage from erosion, silt buildup, and inadequate maintenance of the concrete structures. They are also vulnerable to failure through overtopping in high rainfall seasons. Intentional damage can be inflicted on the dam through excavation and explosions. Dam safety offices provide inspection and advice services, and many have enforcement authority to ensure that adequate maintenance is performed to prevent unintentional breeches. Protection against intentional threats is more difficult. People have tried to deny communities the use of the water supplies by introducing poisons and toxins into the reservoir. In the past disgruntled landowners have blown up dams that denied them water resources. Most dam owners are conscious of the vulnerabilities and maintain surveillance and security of their facilities. This is difficult in areas where the reservoir is a public recreational asset. Security guards, cameras, fences, and water testing are defense strategies at many dams.

### Defense Industrial Base

The defense industrial base sector is a global complex of designers, manufacturers, and supplies of goods and equipment needed to support military activities. It includes intellectual capital like research and development and physical manufacturing facilities that may be part of other CIs, like the metals and critical manufacturing discussed above. The industries and activities are privately owned, government owned, or joint public/private industries, depending on the specific activity and the nation state that is the sponsor. It does not include the utilities that provide the power and communication assets essential to its operations.

This sector is a community benefit by supporting the ability of a nation to defend itself and deter attack. It is also vulnerable to espionage, so security in such facilities is usually very high. Guards, fences, and cameras are routinely employed. Employees typically have background checks before being hired and must display official identification while at work. However, facilities are still vulnerable to cyberattack and from insider espionage or theft, which could be inspired by any type of adversary. Vigilance and protective software provide the best countermeasures for cybercrime and intrusions.

### Emergency Services

The emergency services sector includes a variety of professions and activities that support the four phases of emergency management: mitigation/prevention, preparedness/planning, response, and recovery. Some of the personnel are full-time professionals, while others are volunteers. There are five parts of this sector: law enforcement including specialized teams like explosive ordinance disposal units, canine teams, and tactical teams; fire services, including search and rescue and hazardous materials teams; public safety aviation organizations; emergency medical services; emergency management, including emergency operations center staff and emergency management planners; and public works, including highway repair and debris management. While most of these personnel work for public agencies, there are private emergency services personnel such as industrial fire suppression teams, security guards, and private ambulance companies.

The emergency services sector provides day-to-day management of unwanted events for the residents of a community and the commercial and industrial facilities within it. They also help the community to prepare for natural and technological hazards, as well as intentional criminal or terrorist events, by teaching home and personal preparedness techniques, emergency response skills like light search and rescue, and community surveillance for indicators of imminent unwanted events, whether accidental or intentional, like transit's "see something, say something" campaign.

Emergency medical services personnel are highly visible due to their uniforms and marked vehicles, so they may be intentional targets of criminal activity. This makes it easy for the community to recognize help when it arrives, but it also exposes the uniformed members to possible attack from those wishing to damage the community and its members. One way to instill fear into a population is to deprive it of its protectors, so terrorists often target this sector during insurgencies and civil wars. Surveillance, awareness of threats, and teamwork are the best counters to attacks and disruptive events. Immediate communication links to law enforcement support add a layer of protection for unarmed fire and emergency medical services personnel.

## Energy

The energy sector, defined as electricity, oil, and natural gas (but not nuclear), is a cross cutting CI that supports many of the others, is supported by the transportation sector, and provides essential community services. It is comprised of all the elements needed for creation of energy, including extraction of the raw materials, and it is closely tied to transportation, as the raw materials are moved by train, rail, or pipeline to refineries, points of distribution, or points of use. Almost half of US electricity is produced by coal-fired plants, while about one quarter comes from natural gas and over 20% from nuclear sources, with the last small segment from hydropower, wind, solar, and other renewables. Oil is essential for operating most motor vehicles, and some other vehicles are powered by natural gas or electricity, demonstrating the intertwined nature of the energy and transportation sectors. In the United States 80% of the energy sector is privately owned. Most homes in the developed nations of the world receive electricity from a grid that is either owned by the government or privately owned but regulated by the government.

Electricity is used for lighting homes, cooking, doing household chores, and entertainment. Many homes are also heated with electricity. Other households may use natural gas, kerosene, or propane for cooking and heating. Oil is used for heating homes in some areas and in some places for electricity generation. Energy is essential for manufacturing and operating all types of businesses. Loss of energy would threaten the functionality of other CIs, such as public health, food, and manufacturing while denying the entire population the access to communications and other systems that are critical for modern society. Some element of all the other CI sectors is dependent on the energy CI for operation or control, so it is a cross cutting benefit.

Energy products and services are delivered in long supply chains in generally open areas with little security. Electricity is delivered through a power grid that is aging and in many nations exceeding the demand design standards. This creates a vulnerability to natural hazards and accidents, as well as intentional damage. The northeast US power outage in 2003 left 50 million people in Canada and the United States without power in the August heat from 2 days to 2 weeks. In November of 2006 people in at least five European nations lost power due to a change in operating procedures in northeastern Germany. In July of 2012, 650 million people in India lost power for 2 days, which was the largest electricity failure anywhere. In each case a small accident or a small increase in demand or decrease in supply created the outage, but these events provide a model for potential intentional acts. Trains carrying crude oil have caught fire and derailed in the United States because oil production areas have moved away from existing pipelines. Trains were substituted since 2014, creating a new safety hazard with derailments and explosions and also providing a blueprint for an intentional criminal act. Pipelines have the best safety record of the land modes for transporting petroleum products, but even they have suffered significant failures in North America, Asia, Russia, and Kenya. While a metallurgical flaw in the pipe is the most common cause of pipeline failure, there have been explosions or breaks due to accidental excavation, which again demonstrate the vulnerability to intentional acts. Finally, maritime shipment is the principal method for international movement of crude oil, gasoline, and other petroleum products. Because of maritime regulations, these ships are forbidden from carrying armed personnel, so

they are vulnerable to pirates, as well as to storms and operational problems. The US Navy's seventh Fleet patrols the Straits of Malacca to protect the shipping lanes there, and Combined Task Force 150, a multinational group of naval vessels, patrols the sea lanes around the Horn of Africa to protect oil shipments from pirates.

Energy delivery systems cross substate and national boundaries. Few nations maintain complete energy independence. While there are international regulatory bodies that provide rules for managing energy systems, the need for coordination and collaboration among operators in multiple nations creates an additional vulnerability. Codes and standards for construction and operation may differ across boundaries even within the same nation. Since energy production and distribution transcend boundaries, security measures and resilience to all hazards must be built into the design of the system and its components. Aging energy infrastructure in many areas needs to be addressed in advance of a crisis.

### Financial Services

The financial services sector includes banks, brokerages, credit and financing organizations, and the service industry that supports these functions. It includes individual savings accounts, financial derivatives, credit extended to large organizations, and investments made to foreign countries. The system supports customer activities such as the ability to deposit funds and make payments to other parties, provide credit and liquidity to customers, invest funds for both long and short periods, and transfer financial risks between customers. Most financial services providers are privately owned, but may be regulated by government agencies.

The financial services sector serves the credit and money transfer needs of the population of a nation, while also safeguarding its deposits. This service provides liquidity that permits ease of commercial transactions ranging from credit card-based purchases in a shop to billion-dollar real estate financial arrangements. Through international banking protocols, money may also be moved from nation to nation, including investments and remittances. Unfortunately, the banking system is also used to support criminal enterprise, including terrorist acts.

The financial services CI is dependent on other CIs to function. Large-scale power outages, natural disasters, and cyberattacks have threatened this CI, resulting in heightened law enforcement attention to the sector and greater regulation by government agencies, such as the US Treasury Department. American financial institutions are required to develop and maintain resilience to all hazards. While this represents a large investment of staff time and money, the criticality of this CI and the ongoing risk justify the investment.

### Food and Agriculture

The food and agriculture sector includes farms, restaurants, food manufacturing and processing facilities, and storage facilities. Availability of safe food is critical to all societies. As more of the world's population has become urbanized and no longer food self-sufficient, the ability of the government to regulate the food CI becomes more important. In the United States most of this CI is in the private sector, operating within federal agency food safety regulations, but in some nations the government may own, control, and regulate the food and agriculture CI.

Food is essential for life. Growing, processing, and distribution of food are essential for community health. Issues like pesticide use, genetically modified organism (GMO) use, and availability of arable land and irrigation water must be planned and managed to ensure a safe and adequate food supply for the nation.

The food and agriculture CI is vulnerable because of its many interdependencies. The chemical CI provides the materials required for modern agricultural production, including pesticides and fertilizers. The water and wastewater systems CI provides clean water for irrigation and processes runoff from animal waste in food production facilities. The transportation CI moves the means of production to the farms (seed, fertilizer, agricultural machinery, animal feed, fencing materials) and takes the farm products to processing and market. The energy CI provides power to run the irrigation system, lighting for animal facilities and processing equipment, and fuel for the farm

machinery. A break in any of these CIs can lead to a loss of food production or access for the population. While natural hazards – especially droughts, heat, pests, floods, and freezes – cause the most damage to the food supply around the world, various agricultural diseases have been postulated as terrorist weapons to deprive the population of adequate food, thereby destabilizing the government as people demand action to replace the lost food. Availability of stored food and plans for international food deliveries can overcome short-term threats like single season losses. Infestations or genetically modified diseases without a known cure could create long-term stress for a society. Disease surveillance of crops is the best countermeasure to intentional infections and to catching natural outbreaks early enough for effective intervention and protective measures.

### Government Facilities

The government facilities CI sector encompasses a wide range of buildings and facilities owned by governments. This includes all levels of government and all types of government activities, from military installations to kindergartens, from courthouses to national laboratories, and from community parks to Yosemite National Park. Their commonality is that they are paid for with public funds and provide facilities to conduct the public's business. Some facilities like city halls are open to everyone to do business with government entities. Others, like national laboratories, are not open to the public. The sector also includes the storage of personal, classified, and highly sensitive information, critical equipment, systems, networks, and functions. The CI also includes the cyber assets that contribute to the protection of assets, such as access control and closed-circuit TV. Government employees are also part of the CI because they perform essential tasks or possess specialized knowledge for government operations.

Government facilities may be found in all parts of a country, although they tend to be clustered in national and state capitals. Government-owned facilities in the form of embassies, consulates, and research facilities may also be found in other nations based on treaty agreements. The presence of government facilities offers access to citizens to get vital records or land records, obtain an education, or resolve a legal matter. Local governments provide citizens with an opportunity to watch government in action and to participate in policy making through attendance at public meetings. The presence of government agencies within communities creates access and transparency, which build trust in government. Government monuments and icons provide character to the community and recreational opportunities for the residents.

Because many government buildings are open to the public or are located on public streets, providing security to the personnel and records contained in the facilities is a challenge. Terrorists have attacked the Murrah Federal Office Building in Oklahoma City using a truck bomb parked at the curb on the public street. They have used the postal service to deliver anthrax to the US Congress. Vulnerabilities have to be evaluated and risk management steps used to lessen the threat to the security of the facilities. Metal detectors, guards, closed-circuit TV cameras, and electronic access badges are typical strategies used in government buildings for security.

### Healthcare and Public Health

The healthcare and public health sector includes all healthcare providers, from metropolitan general hospitals to single practitioner clinics, from hospital labs to the US Centers for Disease Control and Prevention. It includes the public health aspects that protect the whole community from infectious disease as well as individual medical care. Medical resources are essential for maintaining the health of the community to cut down on the cost of illness – lost wages, lost productivity, and loss of use for contaminated spaces – and to aggressively manage recognized threats. While some levels of government may maintain a public hospital, or even have a public medical care program, in many nations, including the United States, the direct healthcare delivery system is mostly privately owned and operated. The public health system is usually government operated.

The healthcare system provides cradle to grave assistance with prevention and treatment of illnesses and injuries, with services delivered to individuals. The public health system addresses infectious diseases, disease transmission, and threats to the community from disease-related activities and vectors. They also maintain the birth and death records for a community, use databases for disease tracking, and offer specialized care like kidney dialysis, lead abatement, and HIV/AIDS treatment. They track and study novel diseases to prevent their spread in the community and offer immunizations to community members.

The healthcare and public health CI is uniquely entwined with multiple other CIs. Their equipment and facilities require power, communications, and clean water and wastewater management to operate. They use information technology to access patient records and up-to-date treatment information. Emergency medical services bring the ill and injured to the emergency facility at the hospital, and the hospital relies on the police, fire, and emergency managers for protection, access, and community interface. Goods like medicines and food, services, staff, and patients rely on the transportation system to access the hospital. Loss of any of these CIs would pose a threat to the operation of this CI.

The human population is vulnerable to infectious disease. While immunizations are possible to protect against some organisms, viruses generally cannot be treated with either immunizations or antibiotics, creating the possibility for a pandemic of an illness for which the population has no immunity. Infectious diseases can be intentionally introduced into a community through the food or water supply or even through building air-conditioning and ventilation systems. They can be accidentally introduced through travelers acting as the host or through importation in contaminated cargo. For example, West Nile virus entered the United States through mosquitoes that bred in transit in water in imported tires. Natural disasters like fires, floods, tropical storms, and earthquakes can damage the physical infrastructure that the sector depends on. To overcome these vulnerabilities, the community has regular monitoring of the drinking water, has an emergency response plan for pandemics and natural hazards, and has disease surveillance conducted at the disease registry, in physicians' offices, and through pharmaceutical sales, using big data strategies for the most current information on the purchase of medicines.

### Information Technology

The information technology (IT) sector includes personally owned equipment, commercial facilities, and international linkages. It includes companies that create hardware and software and that offer services related to operating these systems. The Internet is a combination of this CI sector and the communication CI sector. These virtual and distributed functions support almost every other business and information-gathering function, from the common operating picture on the battlefield to diagnoses in laboratories and doctors' offices. The presence of IT is so ubiquitous that people take for granted that their refrigerator, car, and exercise tracking devices are all part of the Internet of Things and dependent on the functioning of the Internet and the equipment to access it.

The IT CI is a complex of privately owned facilities, government-regulated activities, and publicly owned elements. Benefits of IT include greatly enhanced job productivity, immediate access to information on almost any subject, and an array of software program to support creativity and information sharing in all aspects of life and work. Little children learn to read on a laptop computer. Big data programs harness the power of the Internet to accumulate bits of information about how people shop and what they eat to generate information to enhance retail sales, guide the development of a new business, or determine when the flu season has started in a community based on which shelves are empty at the pharmacy.

Because the IT sector is so complex and dynamic, it is difficult to develop a threat and vulnerability profile, as it changes hourly based on new developments in other nations and by unknown actors. Cyber threats are especially significant in this sector, which can be stopped by a denial of service attack, damage to a supporting CI like energy, or hacking by malicious actors.

The size and complexity of the system build in a level of resilience, but viruses, bots, and malware can spread an attack across networks and nations in seconds. Emergency plans for paper and pencil work-arounds, creation of local communications capabilities external to the networks, and installation of attack monitoring and prevention software offer the best response to existing vulnerabilities. The physical elements of the IT CI – offices, buildings, and hardware – need high levels of physical security to deny access to criminals and terrorists. Operational security is essential for protecting information from leaking to would-be attackers.

### Nuclear Reactors, Materials, and Waste

The nuclear industry is an important part of energy provision worldwide. The sector includes nuclear power plants; non-power nuclear reactors used for research, testing, and training; manufacturers of nuclear reactors or components; radioactive materials used primarily in medical, industrial, and academic settings; nuclear fuel cycle facilities; decommissioned nuclear power reactors; and the transportation, storage, and disposal of nuclear and radioactive waste. In 2014 there were 447 nuclear power stations operating in 31 nations, creating over 10% of the electricity consumed in the world. The United States and France are the top nuclear-generating nations, with China, South Korea, Russia, Germany, and Canada also in the top group of electricity generation. (Japan's generation was cut in half after the 2011 Great East Japan Earthquake and Tsunami damaged one of its major facilities, causing the others to be shut down for inspection, and not all were restarted.) The private sector owns and operates most of the assets in this sector, while military-related applications are owned and managed by the federal government and are part of the Defense Industrial Base CI. All nuclear activities are subject to a robust set of central government-administered regulations and protocols for safe handling and secure management.

The benefit of nuclear power is that it is relatively cheap and very clean. It generates electricity by heating water to create steam, which drives the turbine that creates electricity. The water is cooled and discharged into the environment, leaving no greenhouse gasses. It does use a large amount of water for steam generation and cooling, and a pool of water is used to store the spent fuel rods, so location next to a river or other body of water is preferred.

As with all community facilities, natural hazards like floods, earthquakes, fires, and sea level rise may damage the nuclear plant facility. Special precautions have to be taken in the design and construction phases to build in resistance to damage and resilience from the level of damage that cannot be prevented. Since the Japanese triple disaster in 2011 (earthquake/tsunami/nuclear plant damage), most nuclear generation agencies are reevaluating the facility's capability to withstand hazards beyond the design criteria. Germany has a plan to end its use of nuclear power generation, and Japan is reevaluating whether to reopen some of its stations.

Another vulnerability is the movement of fuel rods from the manufacturing facility to the generating station. These trips are coordinated with military escorts and local law enforcement support in most countries to deter theft en route. Nuclear power plants are large and obvious facilities, so their vulnerability to criminal and terrorist activities is significant. Loss of water for the cooling processes or for the fuel rod storage could result in leaks of radioactive materials. A breach of security leading to thefts of material could have significant repercussions. A high level of operational security and physical security is in place at most nuclear generation stations to prevent tampering with processes or theft of fissile materials. They have special emergency planning requirements, including regular training and exercises for the nearby community and for first responders. Recent increases in cyberattacks worldwide have resulted in renewed vigilance over the control systems and computers at nuclear-generating stations to protect the processes from malicious attacks.

### Transportation Systems

The transportation sector moves people and goods worldwide. The components are aviation, highway and motor carrier, maritime, mass transit,

passenger and freight rail, pipelines, and postal and shipping. This broad sector includes the rolling stock, training facilities, ports and stations, personnel, bridges, tunnels, and roadways. It underlies every other CI, since everything has to get moved from where it is made to here it is used, and the movement of some items may be inherent in their operational needs, such as moving children from home to school. The ownership of the elements of this CI is mixed, with roads being publicly owned, many ports and airport facilities being publicly owned by local governments or special districts, and most of the operating companies and rolling stock being privately owned. The government regulates the operations of the private sector, including drivers' licenses, special requirements for dangerous goods transport, and advanced security elements required for aviation, trucking, and shipping containers.

Transportation makes everything else possible. This sector takes people to work and school, for medical care, and for recreation. It moves component parts and consumer goods across town and around the world. It facilitates the global supply chain and the local employment base. It moves hazardous materials in pipelines below ground for greater safety. It ships birthday gifts and computer chips.

Transportation is vulnerable because of its open nature. Road and rail-based transportation is ubiquitous and highly visible. It has some redundancies – ferries can replace bridges, for example – but changes to the status quo will entail new costs in time and money. Passengers on public transit want swift entry and exit, but air passengers tolerate long delays at airports because the risk of terrorist attack is more real to them. Transportation has been famously targeted by terrorists in London, Madrid, Russia, and on 9/11 in the United States. Governments have created protocols for surveillance and security regimes to deter attacks, which have largely been successful. Tighter security at ports and better training for truck drivers have provided additional layers of deterrence, but an open passenger system and a well-documented global supply chain are difficult to protect at all times.

### Water and Wastewater Systems

Safe drinking water is the basis for human life. People can live for only 3 days without water, so its provision is an important function of society, because it is generally not something that individuals can manage unless they live in rural areas. Clean drinking water is essential for disease prevention, while properly treated wastewater is essential for public health and environmental protection. In many countries these are governmental functions. In others drinking water and wastewater treatment are for sale from private entities. In some areas there are public/private partnerships for water treatment and delivery. New challenges in getting adequate freshwater in many parts of the world are leading to new solutions with their own problems, like keeping reusable "gray water" and new water separated, developing clean recycled water systems, and using desalination to modify seawater for human consumption while changing the environment through the discharge of the resulting brine.

Clean water is essential for human life and health. Treatment of wastewater is essential to prevent disease transmission. After the earthquake in Haiti, the UN sent a group of Nepalese soldiers to assist with earthquake recovery work. Unfortunately, cholera is endemic in Nepal but was unknown in Haiti, meaning that the local people had no resistance to the disease. When the soldiers used the local river in Haiti as a sewer for untreated human waste, they caused an outbreak of cholera among the river's downstream users. The disease outbreak is unabated 6 years later in that nation with limited public health assets.

The drinking water system is vulnerable to breaking pipes, infiltration of dirty water into pipes during floods and earthquakes, and denial of access due to changes in river or aquifer levels. The chemicals used to clean the water – mainly chlorine products in most countries – are hazardous if released into the environment. Wastewater itself is an environmental pollutant, and the chemicals used in the cleaning process are also hazardous. Natural hazards and intentional damage can lead to hazardous materials releases, denial of service, water shortages, or

environmental damage. Because of the criticality of water for life, terrorists have threatened to poison water systems and reservoirs. Emergency plans for alternate water sources and facility security protocols provide a level of safety at the processing points. Vulnerabilities in the transportation of the drinking water and the treatment chemicals show the close relationship between water and the transportation sector. Plant operations for drinking water and wastewater treatment both depend on energy to operate the complex systems.

## Place of Critical Infrastructure in Emergency Management

All 16 sectors of critical infrastructure have a role in emergency management. They are all vulnerable to human-caused, natural, and technological damaging events, both unintentional and intentional. The denial of access to the CI in any one of the 16 sectors will have a damaging effect on the society as a whole and on specific other CI sectors with cross dependencies, like water, power, and transportation. The 16 sectors all have a role in all four phases of emergency management.

Critical infrastructure may be the cause of the crisis, it may be the victim of the crisis, or it may be a resource for resolving the crisis. Each phase of emergency management provides a point for planning how to overcome crises when they arise.

### Critical Infrastructure and the Four Phases of Emergency Management

#### Mitigation

Every CI sector must examine its vulnerabilities and its role in community functioning. A thorough threat assessment will indicate the areas where mitigation may be possible. Steps may be taken to strengthen the built environment, to change the way items are transported, or to create less obvious access points to the critical materials. Physical security like guards, sensors, detectors, and locks can be added.

Prevention steps may include deterring intentional harm through security measures, detecting potential intrusions with alarms, and denying access with monitored alarms and cameras and a quick response force to deny entry to a hostile actor. Procedures and protocols can create a barrier to access through operational security by warning employees against talking about their work and wearing their badges in public places.

Insurance can be obtained to ensure rapid replacement of damaged or stolen machinery, equipment, or capabilities. Insurance can not only provide funding for the acquisition of replacements but also provide a conduit to available resources through insurance company contacts.

#### Preparedness

The threat assessment will warn leaders of the CI sectors about probable disruptions and their sources. They should use this information to develop an organizational emergency response plan with a generic response protocol and some threat-specific checklists for organizational reaction and employee actions. They should collaborate with their local government emergency managers to ensure that their plan is in keeping with community plans and protocols and to see what the community expects of them as a CI in the aftermath of a disaster event.

They should also collaborate with other members of their CI sector in developing mutual aid plans for disaster response when some are victims and some are not. For example, electric linemen from California went to New York and New Jersey after Hurricane Sandy to help repair damaged lines and restore power. Guidance documents for developing sector-specific emergency plans are readily available online from US DHS. Most CI sectors in the United States have developed coordinating councils and planning groups that may have additional sector-specific materials to share on planning and preparedness.

Some problems can be solved by anticipating the harm and preparing ahead of time to manage around it. Backup power generators with a supply of fuel and stockpiles of critical supplies – water and medications, essential parts, and clean non-

network laptops with antivirus protection – may enable rapid recovery of operations following a disruption. Employee training and exercises for the expected threats will also speed recovery of services. Training for earthquake safety, cyber intrusion responses, and pandemic disease outbreaks will also help to ensure that employees know what is expected of them: must they stay at work, how soon must they return to work, and will they work from home until the threat is resolved? They also need to train their families in the skills needed to be safe and independent without them, so that they can remain at work or return to work rapidly. Employees who are worried about their families will not remain to help the CI sector organization.

### Response

When the anticipated threat – or an unanticipated threat – materializes, the plan should be activated, the employees should act on their training, and the organization should respond to the threat as robustly as possible. Even if the hazard was unanticipated, it is likely that existing plans for other threats could be quickly modified to meet the new need. For example, New York City did not plan for the unanticipated terrorist attacks of 9/11, but they were able to use elements of their hurricane response plan to manage the evacuation of Lower Manhattan after the World Trade Center towers were destroyed.

As a CI sector it is likely that the government will request assistance from elements of the organization. The emergency plan should include information on deploying employees, supplies, and equipment to meet the needs of CI and dependent sector partners in other communities or even other nations. The more specialized the activities of the organization within the CI sector, the greater the likelihood that resources for mutual aid will be requested. Employees should be trained and equipped to respond safely in a disaster or crisis environment.

### Recovery

Once the crisis has been stabilized and additional harm has been stopped or minimized, the organization must recover as rapidly as possible to stay in business or to meet essential community needs. The recovery portion of the emergency plan should include information on existing supplies and services contracts that could be activated to support the recovery. Open purchase orders and existing contracts can speed acquisition of essential materials and services.

An evaluation of the damage will include the physical facility damage and the damage to supply chains and business relationships. Did the principal client find an alternate vendor? Did the principal supplier sell the goods to another customer? How long will it take to repair the office or manufacturing facility? Should an alternate site be activated while repairs are undertaken? Insurance company adjusters can assist with time and cost estimates for physical repairs. Reconstitution of work groups and work processes will require internal analysis.

Because these are organizations in the CI sector, their recovery will be key to the larger community recovery. Roads have to be inspected and reopened to enable other emergency response to begin. Debris has to be managed. Water, wastewater processing, and power have to be quickly restored. Government will set priorities for the use of scarce resources among the CI within the community to ensure life safety and environmental protection first, so the stockpiling and preparing undertaken in the preparedness and planning phase will ensure internal support for recovery.

### Resilience

Resilience has been called "creating the new normal" or "build back better." Plans for recovery should incorporate mitigation with the goal of preventing the same damage from occurring again in a future crisis. Lessons learned from the performance of the built environment in this event should be used to improve mitigation steps and planning for a future event. Newer designs, materials, or strategies should be adopted to prevent a repetition of preventable losses – whether of materiel, money, or time. CI sector organizations should incorporate cybersecurity strategies into every plan as it is rewritten, recognizing the growing threat from criminals and nation states in the cyber realm. In the United States the goals for

resilience are to plan for a future "with vulnerabilities reduced, consequences minimized, threats identified and disrupted, and response and recovery hastened" (USDHS 2013, National Infrastructure Protection Plan). These goals are especially important for the critical infrastructure sectors.

## Conclusion

Critical infrastructure refers to the cross cutting resources and activities of a society that are essential for its social, economic, environmental, and security sectors to perform effectively to meet public needs. Just as they are the essential underpinnings of the society every day, in a crisis the critical infrastructure sectors must immediately provide support to the community and its government, to ensure stability and recovery from the emergency. A threat assessment provides the basis for effective emergency planning that will lead to a successful response and rapid recovery. Each CI must engage in thoughtful and thorough event planning to ensure effective post-event recovery.

# Critical Misunderstandings in the Nuclear Industry

BC Pemberton
Wantage, England

## Synonyms

Control; Euratom; Governance; International; Regulation

## Definition

An overview of the industry's regulatory governance including its links with European and global nuclear agencies to inform stakeholders and to identify critical issues in need of resolution.

## Introduction

In March 2017, the UK Government "gave notice of its intention to leave Euratom as part of the Article 50 notification process" (Hinson 2017) and set out possible implications (BEIS 2017). Following these events, wide concern has been expressed by commentators on the risks of leaving Euratom (McMullan 2017; Froggatt 2017). To ensure that public debate is informed, an outline UK regulatory arrangement of the nuclear industry and its international context is offered together with suggested critical issues in the regulatory governance of the industry.

## The UK's Regulatory Framework of the Nuclear Industry

The industry's regulatory framework comprises both general and specific regulatory elements. In general, legal and administrative regulatory instruments include statutes and voluntary codes supported by case law and precedent. Additional generic legal provisions also apply, such as those associated with the Health and Safety at Work Act (1974). More specifically, three key elements of the industry's regulatory structure include the arm of government to which it reports, the relevant statutes, codes of practice and standards, and the agencies that monitor these. These are briefly characterized and international regulatory linkages identified.

### Government Departmental Control

The UK nuclear industry's governance structure includes a mix of both public and private sector organizations that have owner responsibilities. A key publicly funded organization is the Nuclear Decommissioning Authority (NDA) responsible for aging plant and wastes. A key private sector organization is Électricité de France (EDF), an international energy utility company. In regulatory terms, departments have a significant role as the government devolves its power including disbursement of public funds (NDA Financial Memorandum 2012). Other responsibilities are implemented with reference to regulatory instruments (Table 1).

**Critical Misunderstandings in the Nuclear Industry, Table 1** Examples from legislative nuclear framework

| Act/regulation | Requirement |
|---|---|
| Health and Safety at Work | Health standards and regulations, for instance, the Ionising Radiation Regulations |
| Nuclear Installations Act | Controls the issue of site licenses |
| Control of Major Accident Hazards Regulations | Regulated jointly by the HSE/EA |
| Radioactive Substances (1993) Ionising Radiation Regulations (1999) | Limits and conditions |
| Environmental Protection (1990) | Considers waste management and contaminated land |
| Pollution Prevention and Control (1999) | Permits for industrial processes |
| Nuclear Industries Security Regulations (2003) and Anti-Terrorism Crime and Security (2001) | Security requirements |
| Radioactive Material (Road Transport) Act (1991) and Regulations (2002) | Road transport requirements for materials |
| The Health and Safety at Work Act (1974) and the Carriage of Dangerous Goods and Use of Transportable Pressure Equipment Regulations (2004) | Rail transport requirements |
| Dangerous Goods and Marine pollutants regulations (1997) | Marine transport requirements |
| Air Navigation Order (2005) and the Air Navigation (Dangerous Goods) Regulations (2002) | Air transport requirements |
| Radioactive Material Planning Legislation | Requirements for the radioactive materials |

### Statutes and Standards

The nuclear industry's primary regulatory statute is the 1965 Nuclear Installations Act (NI Act). The statute deals with nuclear site licenses, the duties of licensees, the right to compensation, and the role of inspectors. Breaching statutory requirements can result in criminal liability; however, the government may invoke other measures such as the withdrawal of a license, or the issue of specific regulatory demands and directions. The requirements of statutes are assessed ordinarily by reference to standards, such as ALARP (as low as reasonable practical), requiring operators to take account of risk in service provision and thereby cost. Operating under its license, the licensee must make judgments that are assessed by inspectors. In making these, inspectors will refer to standards such as BATNEEC – best available techniques not involving excessive costs – in judging whether site practices reflect standards are being applied in a reasonably practicable manner. Inspectors work for regulatory agencies.

### Regulatory Agencies

Regulatory agencies are government-appointed bodies specifically created to support the government's regulatory and statutory needs. The ONR, formerly the Nuclear Installations Inspectorate (NII), is a crucial element of the nuclear industry's regulatory structure. The ONR investigates site incidents and determines noncompliance with regulatory requirements taking enforcement action that can include prosecution. Although the inspector's priority is "to secure the maintenance and improvement of standards of safety" (Robinson 1999: 203), this is undertaken by examination of activities and comparison with license conditions. The site inspectors' role is to ensure that "nuclear safety is achieved through [adherence to] the LCs" (Robinson 1999: 204). In practice, inspectors review site records to determine license compliance, relying on accurate and timely information provided by the licensee. These arrangements "place the responsibility for safety. . .on the licensee" (Robinson 1999: 211). The ONR also ensures compliance with the Nuclear Industries Security Regulations (2003), health and safety, and transport requirements. The Environment Agency (EA) oversees the regulation of environmental discharges using industry-agreed standards to measure performance at site level.

### International Requirements

In addition to national regulatory requirements, international regulatory requirements also exist. In the EU, a separate nuclear community exists – Euratom. Euratom, developed in the 1950s in parallel with the European Common Market, shares the EU institutional framework reporting to the Directorate-General for Energy, a part of the European Commission (see: ec.europa.eu/energy/en/topics/nuclear-energy). Reporting requirements derive from the Euratom Treaty and are detailed in Commission Regulation (Euratom) 302/2005. Frequent Euratom safeguards inspections take place at sites such as Sellafield, "some 220 inspections (about 1000-person days) during 2014" (ONR 2017). European law on nuclear matters includes Directive 2009/71/Euratom, effective from July 2009, and Directive 2014/87/Euratom, effective from August 2014. In addition to these arrangements, further European and global nuclear-related groups exist. The European Nuclear Safety Regulators Group (ENSREG) is an advisory group created in 2007. ENSREG's role is to support the safe operation of nuclear facilities in the EU. Meeting bi-annually, ENSREG has established four working groups to undertake its work program and report to the EU on its activities every three years. In addition to this group there is also the Western European Nuclear Regulators Association (WENRA). This comprises a minimum of 10 nuclear regulatory bodies from across Europe forming a network of nuclear safety regulators dealing with reactor harmonization, inspections, and waste and decommissioning.

The International Atomic Energy Agency (IAEA) is a global nuclear forum created in 1957. With powers derived from its statute of 1956, the IAEA aims to promote safe, secure, and peaceful use of nuclear technologies. In addition, the Nuclear Energy Agency (NEA) works as a forum for sharing information and experience and promoting international co-operation (see: www.oecd-nea.org/). At a global level, the World Nuclear Association (WNA 2017) seeks to promote an understanding of nuclear energy among key international influencers by producing authoritative information, developing common industry positions, and contributing to the energy debate. Given the scale of this regulatory framework, and its apparent ineffectiveness, a discussion of operational and regulatory matters suggests key issues for consideration.

## Discussion

In the UK, the nuclear industry now has an enduring and toxic legacy (DTI 2002) and significant environmental implications. It has been suggested that, together with Concorde, the AGR stations (there are three types of reactor in the UK: Magnox, advanced gas-cooled, and pressurized water) represent "the greatest misallocation of public funds in British industrial history. . .costing the British taxpayer...£11 billion at 1981 prices"

(Durie and Edwards 1982: 28), equating to nearly £31 billion at 2012 prices. Together with the Magnox program, UK nuclear policy is described as "the most expensive failure of post-war British policy-making" (DECC 2011) with aging plants and wastes held in the public sector or potentially requiring taxpayer support. Current estimates suggest the costs for the publicly funded legacy will total (discounted) £164bn (NDA 2016-17), although figures quoted are within a range of £97-£222bn and are time-limited to the first 120 years.

There are many factors that may account for the industry's historic performance level including the governance processes adopted over the decades (Pemberton 2016), but regulatory failures may also have contributed to its demise. One of the key issues for consideration is how the government can ensure an adequate segregation of duties together with an alignment of interests between owners and agents. For the UK nuclear industry, history suggests the maintenance of these principles has proved to be problematic.

In the UK, the government both funds the Legacy's operations and appoints the nuclear regulator's senior staff. These powers indicate high levels of owner influence in a largely non-prescriptive regulatory system may occur. In addition, the UK has a "hands-off" regulatory process whereby "we expect the industry to take the prime responsibility for learning lessons, rather than relying on the Regulator to tell it what to do" (ONR 2011: 1). A close relationship emerges between the "owner," the regulator and the body regulated under which a cooperative regulatory process operates. This regulatory relationship was reviewed by the ONR following the nuclear accident at Fukushima. The ONR found that regulatory independence was not an issue for the UK as the regulator operates independently both of the industry and of Government. At the same time, and somewhat perplexingly, the report noted that government was considering organizational changes "to create a more integrated, focused, independent and accountable nuclear regulatory body with the greater institutional flexibility necessary to sustain the high level of expertise" (ONR 2011: v). The creation of the ONR as a statutory authority was completed under the 2013 Energy Act. However, the powers of statutory corporations are defined and approved by government. In section 92 of the Energy Act (2013), the Secretary of State has the power to

(1) Give the ONR a direction as to the exercise by it of –
   (a) Its functions generally, or (b) any of its functions specifically.
(2) A direction given by the Secretary of State under subsection (1)
   (b) may modify a function of the ONR, but (b) must not confer functions on the ONR (other than a function of which it was deprived by a previous direction given under this section).
(3) The Secretary of State may give the ONR such directions as appear to the Secretary of State to be necessary or desirable in the interests of national security.
(4) A direction given by the Secretary of State under subsection (3) may
   (c) modify a function of the ONR, (b) confer a function on the ONR.

Examples of the problems created by close regulatory relationships between owner and regulator, or regulatory capture, are evident (Connor 2012) together with other governance failures including the Windscale Fire (1957) and issues of control at Sellafield. Other examples of failure in the industry can be found in reports or publications (WISE 2001; Blowers and Pepper 1987). More recently, the NDA were found to have managed fundamental failures in the Magnox contract procurement process. The auditor suggested that the failed process cost the taxpayer £122 m and questioned if the department's governance and oversight arrangements are sufficiently clear and effective.

For an industry with such catastrophic potential where accidents may "condemn. . .millions to pay the cost of nuclear power with their own health" (Caldicott 2006: 39), these performance levels may appear unacceptable. It has been suggested that the industry's regulation and advisory bodies are not sufficiently independent and a thorough review

of regulation is required that questions "the ability of Regulatory. . .institutions. . .to be effective regulators. . .rather than being 'captured' by particular interests" (Abbot and Snidal 2008: 3).

In addition to the risk of regulatory capture, other problems exist. For instance, the UK's retrospective regulatory process relies on the licensee to advise the regulator of noncompliance rather than undertaking proactive risk assessments to avoid failure. The estimated costs of the Chernobyl accident run to "hundreds of billions of dollars" (Dorfman et al. 2013: 477). Nonetheless, the UK regulatory approach requiring assessments of contractor appears sufficient. Implicitly, the approach relies on regulatory trust in the process and the contractor to report failures. Using its 560-staff located at three locations, a form of state-sponsored self-regulation exists where a government-sponsored regulator reviews a government-sponsored agent. What then, are the key issues that should be considered in the public debate?

## Key Issues

This paper does not attempt to provide solutions to the suggested key issues but rather aims to widen the debate on regulatory issues. Five regulatory conundrums are suggested. The first issue concerns regulatory independence avoiding an "identification with the industry, sympathy with the particular problems that regulated firms confront in meeting standards [or the] absence of toughness" (Makkai and Braithwaite 1992; p 61). Possible solutions may be to increase transparency through the use of informed stakeholder groups. For example, rather than the regulator operating under its own constitution as a statutory entity within the UK, it could be required to facilitate meaningful stakeholder reporting and dialogue that informs a wider debate about the industry's performance. Stakeholder groups have been established under statute for the industry but have not been extended to regulatory roles. Additionally, other international regulators such as the IAEA could play a more collaborative regulatory review role.

Secondly, the regulatory process should possibly move from its hands-off, retrospective nature to a more inclusive, prospective role. That is, the current arrangements require the regulator to "operate[s] a goal-setting regime rather than the more prescriptive, standards-based regimes" (ONR 2016a: p 17). Where the operator is a private sector organization required to meet the needs of its shareholders, a potential conflict is created with a hand's-off regulatory policy requiring the licensee to advise the regulator of defined incidents after the event.

Thirdly, key nuclear standards are used based on the "ALARP" principle.

> This principle requires 'nuclear licensees. . .to build, operate and decommission nuclear sites in a way that ensures that risks are kept as low as reasonably practicable [ALARP]. . .. This requires them to balance the level of risk posed. . .against the measures needed to control that risk in terms of money, time or trouble (ONR 2016: p 16).

Given nuclear hazards, this approach may be seen by some to be inappropriate.

Fourthly, the effectiveness of the regulatory process critically depends on the numbers of suitably qualified staff available and the resources to hand. Although the ONR annual report (2017) identifies that the staffing level of the ONR increased from 500 to 523 during the year, and this level of resource did not prevent regulatory events from occurring including the large-scale failure of the Magnox Procurement contract. Of the "3,866 events reported to ONR during the period covered by this report" (ONR 2016b: p4), many were low-level incidents according to international measurement scales. However, the numbers of incidents are not an adequate measure of the risks generated from the nuclear industry, and some suggest that we would be better positioned to manage nuclear affairs if "we could institutionalize the idea that nuclear risk assessments are *contestable judgments* more than they are *objective truths*" (Downer 2013: 18). This theme is echoed by other scholars and underlines the need to treat the nuclear industry as a special case when it comes to governance matters. That is, the risks arising from the industry may be low, but their impact is extremely high and unpredictable requiring a significant resource to attempt mitigation.

Finally, the interface between regulation and governance of the industry should not be viewed as separate issues. The regulatory process described is complex comprising both formal and informal elements. The formal elements include those based in the UK – the ONR, the Environment Agency, the HSE, and others – that together with risk-based standards, create a statutory form of self-regulation that is accountable to the owner. Informal elements include the powers of the government departments to which the agencies are accountable, and other legislative requirements. When viewed individually, each of these elements faces challenges, for instance, the use of risk-based standards to assess performance or the adoption of cash limits in hedging activity. However, if regulation can be viewed as part of governance, historic failures may be avoided. Since the Windscale Fire of 1957, the government have attempted to transfer its owner role through differing governance paradigms. While the governance arrangements over the industry have been heavily criticized by select committees, these criticisms related largely to the management control over costs rather than physical hazards. An impression may be given from such reports that the nuclear industry is similar to other parts of the UK economy, and it is mundane in the sense that its ownership can be transferred to the private sector and its regulation remains in a government agency. Perhaps, given events, history indicates that a sustainable and holistic regulatory governance approach is needed.

## Conclusion

The lively debate on the UK's proposed exit from Euratom in March 2019 has been welcomed. However, this chapter suggests other significant issues to consider including the regulatory process itself. The role of government, the efficacy of statutes, standards, agencies, and the relationship with management make this complex but apparently ineffective. The UK's retrospective, self-regulatory, and risk-based approach may be inappropriate for an industry with potentially catastrophic characteristics experiencing dramatic increases in unfunded cost forecasts and questionable stakeholder support. In the light of such challenges, government have attempted to transfer owner responsibilities through alternative governance paradigms, but have made few changes to the regulatory framework. Five key issues were identified as a basis for further research into nuclear regulation including regulatory independence and the regulatory process, the appropriateness of nuclear standards, the need for adequate resources in an industry that has low risk but high impact, and how regulation "fits" with the industry's governance. The UK now has an enduring, potentially catastrophic legacy and has begun a new reactor construction phase. The fundamental nature of the industry's challenges suggests that the government may need to undertake an overarching review of the industry focusing on issues such as how the new construction phase can be synchronized with the needs of the industry's past.

# Critical Theory of Organizations

Arthur J. Sementelli
School of Public Administration, Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Critical management studies; Critical organization studies; Critical postmodernity

## Definition

Social theory of change in organizations.

## Introduction

Critical theories of organizations refer to the cluster of literature that typically employs elements of the Frankfurt School of critical theory as well as the work of post structural theorists like Deleuze, Derrida, and Foucault among others to understand managerial processes. If a common progenitor existed, one might argue it would be the work of Braverman (1974) who set the tone for critical inquiry in the context of labor. He particularly focused on how labor processes become power games using the combination of a Marxist perspective and concepts like deskilling.

Another critical point in early development comes with the work of Alvesson (1984), who uses the phrase critical organization theory, and begins exploring ties to the Frankfurt School along with issues of dominance in management studies. Alvesson (1984) explicitly talks about issues of rationality and ideology in the context

of late capitalism focusing on issues of power, the reification of work, technology and oppression, and the nature of organizational interests. One of the most important contributions of the piece comes from the recognition of more social elements of organizations, including Marcuse's notion of one dimensionality along with an overt recognition of how social construction helps reinforce power relationships.

Later, work by Steffy and Grimes (1986) raised an epistemic critique of management research with added complexity. They open a dialogue about work conditions and other elements considered earlier by both Gergen (1985) and Hummel (1977). Yet it is not until the emergence of Alvesson and Wilmott (1992a, b, 1996) that we begin to see a clearer conceptualization of what the amalgamation of critical theory and management might look like as a more cohesive conceptual frame. The development of this conceptual frame, in turn, allowed for the emergence of research from Boje (2001), Boje and Rosile (2001), Carr (2000), and others. These scholars opened streams of research in both critical organization theory and critical management, often focusing on inconsistencies between theories and practices. These emergent works have led some of the most dynamic, engaging contemporary managerial research in recent history.

It is important to understand what people often consider the origin of a critical theory of organizations. To do this, we must recognize the elements of Braverman's (1974) argument for a labor process theory. He notably takes on assumptions about capitalism illustrating how production shifts to large corporations. This is coupled with an understanding that labor had undertaken a process of deskilling, which refers to situations where skilled labor is replaced with a combination of semi/unskilled labor and technology. The effect in this case, according to Braverman (1974), is that workers can be kept in a more subjugated role than they would experience as either a skilled laborer or artisan (Peltonen 2016). Braverman (1974), through his work, calls for further consideration about how skilled and/or enriched jobs can impact society. Braverman's (1974) piece also serves as the seminal Marxist critique of the limits and consequences of Taylorism in management and Sociology as well as a progenitor of both critical organization theory and critical management studies.

A critical theory of organizations must therefore reconcile a few elements to be recognized as such. By and large, critical theories of organizations typically will borrow elements from a school of critical theory and apply it within a managerial frame. This contextualization of operating within a managerial frame differentiates critical theories of organization as well as critical management studies from critical theory by removing the inevitable need to wholly dismantle organizational systems. Theories borne out of a Marxist sociological perspective, like Frankfurt style critical theory, implicitly strive for a classless society, which implies the wholesale destruction of power structures. In contrast, critical management theorists adapt within existing structures and frames, offering change opportunities, often advocating for internal process or work redesigns rather than the wholesale destruction of a system of capital.

Out of the early theorists examining critical theories of organizations, Clegg and Dunkerly (1980) offer perhaps the most intimate exploration of critical theory and organizations. While they highlight the Marxist perspective as part of their argument, what stands out is the selection and consideration of Gramsci as source material. Clegg and Dunkerly (1980) persuasively justify the links to Gramsci based on his practical experiences at Fiat, his activism, and his scholarship. This selection of Gramsci for source material is uncommon given that he is not a Frankfurt theorist and that he bridges commerce and social activism as well as theory and practice. Clegg and Dunkerly (1980) contribute powerfully to the emergent literature by bridging concepts and highlighting how managerial practices (deskilling, Taylorism) maintain and reinforce power disparities as well as dominant ideologies of control, explicitly linking management practices to broader hegemonic practices in society.

Fischer (Fischer and Sirianni 1984) opens the discussion of a critical theory of organizations to the public sector with a managerially focused edited volume that collected works from other prominent scholars, interspersing within them

more contemporary cases and contexts. Of particular note is Fischer's "Ideology and Organization Theory" chapter which builds upon both Braverman's (1974) and Clegg and Dunkerly's (1980) works, articulating that the "real" contribution of Taylorism "was less the development of scientific techniques for measuring work processes than the construction of a new mode of organizational control" (Fischer and Sirianni 1984 p. 177). Paired with contemporary classics from Lipsky, Perrow, and others, this piece represents one of the few cross sectoral applications at the time.

Steffy and Grimes (1986) continue to develop a critical theory of organizations through a focus on organizational science. They propose a philosophical critique of research in organizations as an alternative to existing empirical approaches, focusing explicitly on the value-free assumption often made at the time. Moreover, they state that assuming away the subjective character of observed facts, knowledge gained in organization science would be one sided and incomplete (p. 328). Integrating elements of critical theory into the study of organizations allows for discussions of technology as control, as well as of reasoning as a normative force. Most interesting, however, is the overt link of critical theories of organization to change (p. 333) and change management.

As critical organization theory continues to develop, one uncovers links to specific elements of critical theory such as Alvesson and Willmott's (1992b) notion of microemancipation. Microemancipation implicitly requires a commitment to positive change within existing structures, similar to the commitment posed by Steffy and Grimes (1986). Microemancipation itself has become contested based on the practicality and viability of the concept in a managerial context. Citing issues of practice, Huault et al. (2014) point to (1) the implications of a constant struggle, (2) problems of identifying resistance (or "everyday misbehavior (p. 27), and the fragmentation of effort. Huault et al. (2014) take a step closer to Frankfurt style critical theory advocating for a more radical reconfiguration that moves organizations toward equality.

## Conditions for a Critical Theory of Organizations

As seen above, concepts relating to a critical theory of organizations have certain things in common. They often draw upon Frankfurt theorists (Horkheimer, Adorno, Marcuse, Benjamin, and Fromm), second-generation theorists like Habermas, and the work of non-Frankfurt, neo--Marxists like Lukacs and Gramsci. Especially in more contemporary work, these theoretical perspectives are enriched or otherwise supplemented with the work of what some call poststructuralists like Baudrillard, Butler, Deleuze, Derrida, Foucault, Kristeva, and Lacan as a way to bridge the more abstract work of critical theory into managerial theory and practices.

More specifically, in light of the rise of contemporary consumerism, civic engagement, identity politics, and spin, people find that interesting combinations of critical theories and the post-structural theories emerge. These combinations can allow cogent frames for understanding ideas like digital value, engagement, identity, and semiotics as well as their influences on managerial thought to emerge as points of concern and consideration. As organizations both influence and are influenced by their environments, a critical theory of organizations holds promise as a means to capture, understand, and possibly adapt to emergent issues of digital products and services along with discussions of value, engagement, identity, and semiotics.

## Differentiation

The tone of each perspective on critical organization theory tends to vary along the lines of the scholar of critical theory employed as a primary source. Most often, this is a function of the different a priori assumptions about ideal states critical theorists have and whether or not they are attainable. As an example, people embracing the work of Habermas tend to implicitly strive for egalitarian communicative structures as desirable outcomes. In contrast, people drawing from Marcuse, in contrast, tend to rely more heavily on

notions of consumer behavior. Gramsci, in particular, often reflects a tone most associated with prison narratives and narratives of more overt oppression, often in workplace contexts. Horkheimer's work differs primarily in scope and focus, as it tends to reflect more generalized societal contexts of suffering and oppression.

A method to distinguish among the variety of critical organization theories then emerges. The particularities of a contemporary scholar's perspective are colored by the critical theorist or theorists, as well as if any poststructuralist theorists inform a particular approach to critical theories of organization. The nuances of differences, in essence, reflect the a priori assumptions of the source material as well as any biases, predilections, or contexts where they are drawn from. The consequence, of course, is that scholars and practitioners must take care to minimize incongruities among the source material and applications to avoid mismatches.

## Current Applications

One of the most fruitful incarnations of a critical theory of organizations comes in the form of critical management studies. Critical management studies are understood as clusters of managerial and organizational thought that often encompass both critical and poststructural perspectives. An emergent line of inquiry captures managerial narratives and their analysis using social lenses that include radical democratic theory, feminism, postcolonialism, neo-Marxism, and gender studies to name a few. In this sense elements of critical theory have been hybridized with elements of poststructuralism, postmodernity, and organization studies. This hybridization attempts to reconcile the artifacts of earlier work of Steffy and Grimes (1986), which ambitiously tried to resolve positivist narratives of organization science with hermeneutics and phenomenology via philosophical assumptions.

More contemporary work, such as that of Carr (2000), linked Marxist informed critical theory with Freud to understand organizations. Carr (2000) adds to the literature bringing questions of "moral" choices in public sector organizations that can be deconstructed and the power disparities effectively reflected upon and analyzed using critical theory, thereby informing change management. Similarly, Jurie (2000) linked aspects of critical theory using Habermasian path to achieving "joint benefits" via reflexive communication in a decidedly public sector context.

With the advent of Boje (2001), we begin to see even more complexity and depth being brought to bear on public affairs. His critique of state power using notions of spectacle and carnival represents an effective fusion of prevailing notions of postmodernity of the time with themes from critical theory to offer a perspective on organizations now understood as "critical postmodernity" with examples of virtual resistance, electronic disobedience, and other prescient organizational themes. Similarly, Boje and Rosile (2001) turn this emergent critical postmodern theory toward the topic of employee empowerment, revealing underlying hegemonic processes as well as microlevel power dualities that impact human resources management.

This is not to say that there are not also works that focus on critical organization theory more generally. In most instances, contemporary critical organization theories have trended more toward application and further hybridization. Applications appear most prominent in European scholarship, though there are some emerging examples in the USA and other areas. One of the more utilized examples comes from Durepos and Mills (2012), who employ critical organization theory along with actor network theory. Another is Rhodes and Wray-Bliss (2013) who employ it to the study of ethics. A third, O'Toole and Grey (2016) use critical organization theory to wrestle with issues of volunteerism.

We find ourselves in the twenty-first century with a well-developed managerial tool for theorizing which benefits explicitly from praxis based approaches. As demonstrated, the traditions of a critical theory of organizations as well as the emergent critical management studies and critical postmodernity are colored heavily by practitioner experiences as employees, as change agents, and as managers making this theoretical approach

both applicable and compelling while minimizing some of the intellectual baggage associated with more purely sociological approaches to critical theory many are more familiar with.

Given the increasing applications and emphasis throughout the management literature, one might argue that it offers enhancements to both the theory and associated practices of management. In the public sector, in particular, this underexamined concept has the potential to offer even more insights into organizational life, particularly given the peculiar relationships often experienced in the practice of public affairs. One can conclude by making the claim that critical organization theory and critical management studies, though still from being mainstream concepts, have carved out some niche applications that have demonstrated its relative worth in the managerial literature. The long-term impact of these bodies of literature has not yet been fully realized, but appears to be gaining ground as people consider and reconsider work, life, and organizations.

# Crowdfunding and Social Policy

Martin Mayer
Old Dominion University, Norfolk, VA, USA

## Synonyms

Alternative finance; Direct charitable giving

## Definition

Crowdfunding is a combination of crowdsourcing and fund-raising in which monies are raised through online platforms connecting ideas to supporters. Increasingly crowdfunding has been utilized in local government as a means to address resource needs while further engaging and giving voice to citizens.

## Introduction

In mid-2006 the US housing market was at an all-time high, having risen steadily during the early

2000s in the wake of the dot-com collapse. The combination of a volatile stock market and low interest rates led to money increasingly being funneled out of stocks and into housing. At the time, the housing sector had never experienced a national decline, and investors considered it not just safe but exceedingly profitable; rates were low and money was easy to come by. By the summer of 2007, after years of excessive subprime lending and a spike in loan defaults, the bill had come due for many of the major banks. The resulting credit freeze, bankruptcies, and bailouts had a devastating impact on every level of the economy; some of the effects are still being felt today. As has often been the case in times of great economic and financial strife, uncertainty leads to opportunity, which leads to innovation. Crowdfunding is one such recent innovation.

A relatively new term in the social policy lexicon, crowdfunding utilizes online technology to connect ideas to resources. Crowdfunding began as a way to fund business ideas and artistic endeavors where an entrepreneur would often promise a reward or gift to those donating start-up funds for a particular project. Despite the onset of the recession in 2008, crowdfunding campaigns and revenues continued to grow. With the passage of the Jumpstart Our Business Startups (JOBS) Act in 2012, which further eased fundraising and solicitation restrictions, crowdfunding was given an endorsement and a sense of legitimacy as a funding mechanism by the federal government. At the time with many local governments still trying to dig out of the ongoing recession, funds and resources were particularly scarce. The combination of the continued private sector success and eased regulations began to open the door for local government to begin to turn to crowdfunding as a more inclusive form of decision-making and service provision.

This remainder of this text explores the emergence of crowdfunding in the public sector (civic crowdfunding) and its impact on social policy. This is done by first providing an overview of the emerging field of crowdfunding. This includes briefly examining the history and factors contributing to the growth and development of civic crowdfunding. This includes briefly examining the history and factors contributing to the growth and development of civic crowdfunding, examining the theoretical development of the field and also highlighting components of a successful civic crowdfunding campaign. Next, the social policy implications for local government and the citizenry engaged in civic crowdfunding will be discussed, and this will be followed by a brief discussion of the strengths and challenges inherent to civic crowdfunding campaigns. And finally, potential opportunities for research and further development within the field moving forward will be highlighted within a summary conclusion that details how civic crowdfunding has evolved into a tool for local government that has the potential to increase service and engagement between the government and constituents.

## Overview

### History

In its most basic conception, crowdfunding utilizes the resources of the crowd to achieve a shared goal. The continued growth of technology has made it easier than ever to develop platforms in which individuals can be connected to ideas and has fueled the growth of crowdfunding as both a resource generator and increasingly a tool for local government. While crowdfunding in its current iteration (as a citizen driven online activity) has grown and evolved substantially over the last 20 years, it is far from a new concept. Examples of crowdsourcing, utilizing the resources of the citizenry, financial or others, can be found throughout history.

One of the more prominent early examples is the funding of the Statue of Liberty pedestal. After receiving the monument from the French, it sat unassembled in New York Harbor for nearly a decade as Congress, the City of New York, and private citizens differed on how the monument pedestal and assembly should be funded. Eventually, publisher Joseph Pulitzer appealed to his readers to help fund the pedestal construction. In a period of less than 6 months, Pulitzer received donations from over 160,000 citizens, with the majority of donations totaling less than one dollar.

Throughout the fund-raising period, Pulitzer recognized each individual contributor in his newspaper. Pulitzer's campaign, with the exception of the fund-raising medium, shares many similarities to modern crowdfunding campaigns, including the appeal by a primary convener to a large number of constituents and the reliance on a large number of small donations to collectively achieve a shared goal.

Pulitzer is just one example of several crowdfunding efforts throughout the nineteenth and twentieth centuries; however, it was not until the digital revolution of the 1980s and the following Internet age when technology allowed for the connecting of people from all expanses of the world that crowdfunding began to be taken seriously as a realistic platform for raising money and funding projects. Initially it was used primarily within the artistic community as a way to fund music, tours, and other related things. As success followed so has the number of different funding platforms focusing on everything from education to business ventures and eventually local government civic matters.

The growth and legitimacy of crowdfunding as a potential revenue source for multiple sectors and industries were further buoyed by President Obama's signing of the JOBS Act in the spring of 2012. The JOBS Act, as it relates to crowdfunding, updated provisions from the 1933 Securities Act by easing restrictions on fund-raising, advertisement, and solicitation while also providing a sense governmental legitimacy to the growing field. Collectively the impact has been substantial as total revenues from crowdfunding ventures have increased more than 1000% since 2012 to more than $10 billion in the year 2014 (Fundable 2015). While this number includes a disproportionate amount of generic crowdfunding campaigns (campaigns that raise money for any number of issues and concerns), the growth of civic crowdfunding has had a similar rise albeit on a smaller scale.

## Theoretical Development

Conceptually, crowdfunding borrows from and incorporates a number of literatures and theoretical bases including collaboration, communications, local government, and the New Public Service. The lack of theoretical development and reliance on other literature is primarily attributable to the recent emergence of the field as an innovation that straddles a number of existing literatures and disciplines. This disparity, while limiting to the extent of overall theoretical development, also has a positive effect by providing a diverse collection of potential explanations and opportunities for the field and literature to explore and incorporate. Despite the still developing nature of the field, much can be gleaned from the incorporation of the above literatures in explaining crowdfunding as an innovative tool for local government that crosses a number of existing boundaries and has the potential to make government and service delivery increasingly accessible.

In collaboration and through the use of various technological channels, citizens and government are able to come together to address emergent problems in increasingly challenging environmental conditions. While civic crowdfunding exhibits many characteristics that comprise and lead to the success of collaboration, such as the need for communication strategies, the importance of diverse stakeholders, social capital, and trust, it is important to understand that not every aspect of a civic crowdfunding campaign is truly collaborative. Often the convening process of collaboration and civic crowdfunding (identifying key stakeholders and resources) can be similar, yet as each process grows, they may continue to diverge with crowdfunding looking less and less like a true collaboration. In both cases, existing social capital can foster trust and ultimately lead to buy-in among individuals (O'Leary et al. 2012). Civic crowdfunding projects usually begin to take shape when there is the articulation of a particular community need or desire. Once identified and conceived as a project, social capital is critical to bringing in potential investors, in turn helping to fund the project while also increasing citizen participation and transparency.

Much like in a true collaboration, social capital is not necessarily a prerequisite in civic crowdfunding, but the presence of social capital between actors can greatly expedite the process.

In instances where social capital is low or nonexistent, there are a number of potential strategies aimed at increasing it while also building trust. One of the most effective methods has been found to be maintaining and promoting frequent and open lines of communication between all involved parties (Howe 2008). This is typically done through frequent multifaceted online updates and the repeated solicitation of feedback in a manner that is both inclusive and transparent while further engaging the citizenry (Brito 2008).

Another key aspect of collaboration and crowdfunding, particularly in the public domain, is that of mutual benefit. Local governments have to receive something appealing enough to incent their participation. Normally the funds are required to address a particular project; on the other hand, the project has to be deemed worthy enough by citizens willing to put up the necessary resources to make a project a reality. Mutual benefit is critical, especially in selecting the right projects, projects that are likely to get funded and that don't waste precious time, attention, and resources of all involved parties.

Crowdfunding has been described as a mix of top-down/bottom-up collaboration (Tapscott and Williams 2008), which can move toward creating or disrupting public value at an incredibly fast pace (Brabham 2013). As civic crowdfunding becomes increasingly prevalent and much of the collaborative process takes place through non-traditional online institutions in which knowledge, power, and capacity are increasingly dispersed, it has become exceedingly important to study these fluid connections and relationships (Tapscott and Williams 2008).

Along with the collaboration literature, another lens that offers insight into the connections and relationships necessary for civic crowdfunding success is the New Public Service. The New Public Service advocates for government predicated on citizen needs; the primary role of administrators is that of service to their constituents. An engaged citizenry is thus critical to understanding what exactly it is that citizens want. One way to engage citizens is through the fostering and development of multifaceted coalitions that highlight member strengths and resources (Denhardt and Denhardt 2000). Participants are often civic-minded individuals driven by a sense of purpose and duty (Brabham 2010). In some instances, additional incentives can be helpful and necessary to further engage the citizenry; these typically include opportunities to further participate in various stages of the planning process, volunteer opportunities, and invitations to special commemorative events (Davies 2014). Many concepts of the New Public Service are also characteristics of successful crowdfunding campaigns.

## A Successful Crowdfunding Campaign

Citizen engagement is critical to the success of a crowdfunding initiative, and one of the primary ways to engage the citizenry and make them aware of particular projects is through the use of social media. An effective social media presence cannot only raise awareness and engagement, but it can also serve as a tool to increase transparency, in turn further building trust and social capital between project administrators and the community (Brito 2008). By promoting an inclusive policy process, administrators allow citizens to take a more active role in project design and development while also increasing the likelihood of project success (Seltzer and Mahmoudi 2012).

In addition to engagement, successful civic crowdfunding initiatives are often characterized by the clear articulation of a community need or visible problem. While the articulation of need typically originates from the organizational level in a top-down manner, visible problems are often rooted at the individual level and flow upward. In this case, presentation and how a problem or issue is framed can have a significant impact on the success of crowdfunding proposal. This connection once again reinforces the importance of engagement, coalitions, and mutual benefit to the success of crowdfunding initiatives.

In addition to engagement strategy and the use of technological innovation, in order for civic crowdfunding campaigns to be successful, they must address issues that broad segments of the population care about. Typically these issues may be smaller scale but still have a broad impact, like a local park, for example, something that is

non-excludable and has the potential to provide enjoyment for all visitors.

## Social Policy Implications

Crowdfunding initiatives can have a number of social policy implications both for local government and the citizenry. Utilizing crowdfunding also presents a variety of strengths and challenges that must be carefully weighed when determining when to use crowdfunding to supplement traditional fund-raising and service delivery.

### To Local Government

Crowdfunding initiatives can help administrators with not just budgeting and resource shortfalls but also with project development decision-making. For example, if a project is pitched and receives little support, it may be something that falls off the agenda entirely; conversely, if a project receives a fair amount of support, but comes up short of the funding goal, it may need to be reevaluated and possibly further pursued through more traditional means. The online format allows for greater citizen involvement as well as offering municipalities an additional feedback mechanism to determine needs of the constituency based on the citizens' response to requests for funding. The potential and utility of crowdfunding as a nontraditional budgetary tool lie in its ability for increasingly responsive and transparent governance.

One of the primary implications and challenges for administrators is figuring out the proper role of citizens in the planning and development process. The challenge can be further compounded when incorporating civic crowdfunding into traditional tax-and-spend project development, where citizens may not have the same level of input into a particular project as other stakeholders.

Accountability is another implication and concern for administrators, particularly how to deal with changing and potentially divested accountability. Civic crowdfunding can lead to a shift in accountability, in which citizens with greater input also want greater accountability. This shift in accountability ultimately may lead to finger-pointing when something goes wrong and politicians, administrators, and citizens all attempt to absolve themselves from blame (Miglietta et al. 2014).

Crowdfunding may also raise questions about budgeting and planning. Depending on the number of projects planned and how many are successful, crowdfunding may impact the budget and be the cause for certain projects to be put on hold or canceled altogether. Planning can be a concern for many of the same reasons, especially when administrators need to determine how much time and resources to put in to project planning for crowdfunded initiatives that may or may not be successful.

### To Citizens

Similar to the implications for administrators, the potential implications for citizens involved in crowdfunding can be many. One of the primary implications is the potential to offer a much greater voice and involvement in project development and success. Due to the need and reliance of citizen resources in these types of projects, citizens can also play a larger role than in traditional settings when it comes to decision-making and resource allocation. Ultimately, greater citizen involvement promotes a more transparent process that can foster significant increases in social capital between citizens and administrators (Miglietta et al. 2014).

A potential cause for concern related to the changing relationship dynamics between citizens and administrators is once again related to accountability. As citizens typically have greater involvement in crowdfunding initiatives, the traditional channels of authority and accountability can devolve among a number of stakeholders. Citizens often expect greater accountability in such situations, yet due to the changing structures, it is far from assured.

### Strengths

Civic crowdfunding can promote democratic citizenship and encourage individuals to take a more active role in the process in government and decision-making; this can lead to more representation, greater transparency, and less risk of fraud (Miglietta et al. 2014). In addition to the benefits

of greater involvement and engagement, perhaps the most obvious is the resources that crowdfunding can bring to the table. While not a replacement for traditional budgeting and service provision, crowdfunding has been increasingly utilized as a means to provide scarce resources and create public value within participating communities. Proponents argue that civic crowdfunding has the potential to give citizens a greater opportunity to impact local government policy and service provision within their communities.

### Challenges

A key challenge that must be addressed when utilizing crowdfunding is that of role definition. As the number of stakeholders increases, so do questions over roles and boundaries, particularly as it relates to accountability and decision-making (Davies 2015). There is also the concern over how to best utilize and incorporate crowdfunding as a relatively recent innovation into more traditional methods of governance and service delivery (Miglietta et al. 2014).

One major criticism that must be taken into account is the potential or perception that the process could be co-opted by elites (Seltzer and Mahmoudi 2012). Proper care must be taken to design the necessary structures to guard against this concern and maintain the equity and the integrity of the project. Designing such structures remains one of the greatest challenges facing administrators seeking to take advantage of crowdfunded resources.

## Conclusion

At its best, crowdfunding has significant potential for administrators to better involve citizens in the daily business of government all the while addressing pressing resource issues. On the other hand, crowdfunding is a recent innovation that is not without legitimate concerns over equity, accountability, and representation. The key to the continued use and growth of crowdfunding to address community needs and projects will be figuring out how to best design the structures required to maximize resources and relationships. Further understanding these roles and expectations, especially as they relate to the citizens, is critical to the development of the field and the acceptance of civic crowdfunding as a potential alternative funding mechanism for local government.

As a recent innovation, civic crowdfunding has shown the potential to greatly impact local government through an upheaval in the traditional models of resource creation and service delivery. When properly leveraged, civic crowdfunding has the potential to increase transparency and engagement all the while providing valuable scarce resources for communities that desperately need them. Civic crowdfunding encourages involvement and can foster greater social capital within the local funding communities. Additional research is necessary however to better understand the potential challenges that this new innovation brings and also to further delineate best practices in order to optimize chances of success.

## CSOs and Public Financial Management in Ghana

Joseph Antwi-Boasiako[1], Gladys Nkrumah[1] and Ama Kissiwah Boateng[2]
[1]Department of Public Administration and Health Services Management,
University of Ghana, Accra, Ghana
[2]Faculty of Public Governance and Administration Sciences,
National University of Public Service,
Budapest, Hungary

### Synonyms

Budgeting process; Think tanks

### Definitions

Public financial management is how governments manage their public resources and the impact of the resources on the economy of the country.

Public financial management also refers to the allocation and utilization of governments' resources in an effective, responsive, and efficient way.

### Introduction

Public financial management involves activities of the government setting the rules governing the use of public resources and how revenue is mobilized (Simson et al. 2011). In most countries, the public financial management process incorporates four stages: budget formulation, budget approval, budget execution, and budget evaluation which can further be divided into more key processes. For instance, in Ghana, the public financial management process incorporates strategic planning, budget preparation and approval, budget execution, record keeping, accounting and reporting and monitoring, evaluation, and auditing (Adzroe 2015).

In the public financial management process of Ghana, different actors are mandated by law to participate in the various stages. Some examples of the mandatory stakeholders include the National Development Planning Commission; Metropolitan and Municipal District Assemblies and Ministries, Departments, and Agencies; Ministry of Finance; Parliament; Controller and Account Generals' Department; Public Accounts Committee; Ghana Audit Service; etc. (Adzroe 2015). Other groups like political parties and civil society organizations may serve as permissive stakeholders to influence and perform different roles and functions in the public financial management process of Ghana (Ahenkan et al. 2013; Adzroe 2015).

Ramkumar and Krafchik (2007) posit that traditional public financial management process in most developing countries until the late 1990s excluded civil society organizations. However, civil society organizations have built their capacities to participate in the budgeting processes of their countries. While some scholars and international organizations have recognized the role played by civil society organizations in the public financial management of some countries (World Bank 2002; Ramkumar and Krafchik 2007), others still believe that there is paucity of material in the literature (Petrie 2003).

Civil society organization roles in public financial management have mainly been studied under two broad themes which are auditing and non-auditing roles (Ramkumar and Krafchik 2007). They posit that in performing the auditing roles, civil society organizations serve as a check on state institutions to ensure an efficient utilization

of financial resources. The World Bank (2002) has also explained that civil society organization roles are not only limited to the auditing roles; however, they adopt participatory approaches to participate in the public financial management especially in the preparation of the budget.

In most African countries, especially in Ghana, where issues of financial mismanagements are predominant, civil society organizations have been very vibrant and are mostly seen to be performing the auditing roles (Abdulai and Quantson 2009). As a result, attention has not been given to the non-auditing roles of the civil society organizations in the public financial management of Ghana and hence has not been well explored in the literature. This entry therefore specifically seeks to assess the non-auditing role of civil society organizations in the public financial management of Ghana. The introduction section is followed by an overview of the public financial management process in Ghana, the methodology used for the entry, findings and discussions, and conclusion.

## Public Financial Management Process in Ghana

In Ghana, public financial management derives its legal framework from an Act of Parliament, the Public Financial Management Act (Act 921) of 2016. The Act regulates the management of public finances in Ghana and defines the roles of persons who are mandated by law to control and manage state assets, liabilities, resources, and funds. This is to make sure that the funds are sustainable and in line with the level of public debt to provide for accounting and auditing of public funds and all other related matters.

Public financial management goes through some processes (Andrews et al. 2014; Lawson 2015). Andrews et al. (2014) explain that public financial management systems are embedded by a broader set of processes, systems, and institutions. However, some of the processes are similar among countries, while others still have differing processes. This, therefore, makes the issue of public financial management contextual (Andrews et al. 2014). Generally, most public financial management processes around the world go through four stages: budget formulation, budget approval, budget execution, and the stage of evaluation of the budget. However, some countries may further divide these four processes into subprocesses (Andrews et al. 2014). Lawson (2015) posits that some of the processes are further divided into six which are the policy design stage, budget formulation stage, budget approval stage, budget execution stage, accounting stage, and external auditing stage.

In Ghana, Adzroe (2015) asserts that the public financial management cycle goes through five stages. The first stage in Ghana is the strategic planning. The strategic planning involves state actors like the National Development Planning Commission; the Metropolitan, Municipal and District Assemblies; and the Ministries, Departments, and Agencies. The next stage after the strategic planning is the budget preparation and approval with some actors like the Ministry of Finance preparing the budget and Parliament approving it. The budget is then executed in the next stage of the cycle. This stage is where the government generates the needed revenue and administers expenditure. The fourth stage involves record keeping, accounting, and reporting. The last stage in the public financial management cycle, according to Adzroe, is the monitoring, evaluation, and auditing which also involves state actors like the Ghana Audit Service and the Public Accounts Committee of Parliament. The public financial management process of Ghana is illustrated in Fig. 1 below.

## Methodology

In assessing the non-auditing role of civil society organizations in the public financial management of Ghana, the entry adopted the qualitative research approach. This approach answers the questions of how, what, and why as this entry seeks to do. Civil society organizations in Ghana have demonstrated that their activities can be found in areas such as governance, health, and

**CSOs and Public Financial Management in Ghana, Fig. 1** PFM process of Ghana

service delivery, among others. Selected civil society organizations for this entry were in the area of governance and also have shown evidence of participating in the public budgeting process of Ghana. Twelve civil society organizations were identified by the researchers with ten of them giving access to the researchers. The ten civil society organizations were found to be performing roles across the public financial management process in Ghana. Face-to-face interviews were then conducted with designated members of these civil society organizations using a semi-structured interview guide. In some cases, interviews were conducted with the top management executives of these civil society organizations including country manager, chief executive officer, and president. Other interviewees included policy analysts and research officers. Data collected from the interviews were analyzed using the content analysis approach.

## Civil Society Organizations and Public Financial Management in Ghana

In assessing the non-auditing roles of civil society organizations for this entry, two broad themes were generated from the interviews with the respondents. It was found that under the non-auditing roles, civil society organizations played participatory roles in the planning stage and the budgeting stage of the public financial management process. The World Bank (2002, p. 1) defines participation as "the process through which stakeholders influence and share control over priority setting, policy-making, resource allocations and access to public goods and services." The participatory roles of the civil society organizations are discussed below.

## Participatory Planning

In Ghana, priority setting is done at the strategic planning stage of the public financial management process. At this stage of the process, the National Development and Planning Commission is mandated by law to perform this function with the Ministries, Departments, and Agencies and the Metropolitan, Municipal, and District Assemblies. However, data from the interviews conducted shows that other non-state actors like civil society organizations are permitted to participate in the planning process.

These civil society organizations serve as groups that represent the citizens to make inputs into the strategic planning which reflects the

expectations and needs of the people. Civil society organizations interact with the people at the local level through research and when called to participate in the process submit inputs which reflect the needs of the people.

A participant from one civil society organization narrated how they participate in the strategic planning stage of the public financial management process:

> What we do at the strategic planning stage at the national level is that when the National Development Planning Commission develops Medium Term Development Framework and the Ghana Shared Growth and Development Agenda, we are involved in the consultation process. And when guidelines are given to the Metropolitan, Municipal and District Assemblies to develop their own plans at the local level, we are also there to make inputs.

Another participant from a local government advocacy civil society organization also explained that:

> At the strategic planning stage, we get the citizens to identify their problems or challenges and when we are called to participate we channel these problems to the local assemblies for them to be included in the Assembly Development Plan.

According to Abdulai and Quantson (2009, p. 122), "evidence suggests that these organizations understand local conditions better and have a comparative advantage over national governments." By this, civil society organizations have found support from the national governments, and this has paved way for civil society organizations to participate in the planning of national budgets in Ghana. In GPRS II, an aspect of public financial management, data shows civil society organizations were engaged in the planning of the program. These civil society organizations were consulted once or twice by the National Development Planning Commission to participate in the thematic groups (Abdulai and Quantson 2009). Ahenkan et al. (2013, p. 165) explain that for citizens and civil society groups to participate properly in the revenue management of their districts, "they must as well be able to influence how the planning is done."

## Participatory Budgeting

Another role played by civil society organizations in Ghana is participatory budgeting. Public involvement in the budgeting process is envisaged by the World Bank as participatory budgeting and has been defined by Marquetti et al. (2012, p. 63) as "a form of democracy in which citizens and civil society organizations have the right to participate directly in determining fiscal policy." The World Bank (2002) outlines that at the budgeting stage, civil society organizations can participate in the budget formulation and budget review and analysis.

### Budget Formulation

At the budget formulation stage, the stakeholders usually involve the cabinet, sector ministries, and the Ministry of Finance (World Bank 2002). The case of Ghana at this stage is not different (Adzroe 2015). Civil society organizations participate in the formulation by proposing spending projects, setting priorities for spending, and helping to decide which projects should be funded.

In Ghana, Akwetey (2007, p. 7) as cited in Abdulai and Quantson (2009) explains that the Ministry of Finance and Economic Planning (MOFEP) in 2005 introduced an open-door policy which was aimed at encouraging civil society organizations to submit inputs before the national budget is prepared. As part of the "new budgetary approach," the Ministry invited civil society organizations through open advertisement in the electronic and print media to submit memoranda on issues that informed the prioritization of resource allocation in the national budget. Some selected civil society organizations also narrated their participation in the budgeting process even though it was no longer through the open-door policy. They were rather invited as stakeholders during the budget preparation stage. A respondent narrated that:

> In the preparation of the budget, we do a district and regional level consultation to take inputs from the citizens into the national budget. We go to many districts and ask them what they really want to reflect in the budget and then we consolidate

> everything into a citizen's alternative budget or budget input and present it to the Ministry of Finance.

A campaign coordinator of one civil society organization also explained that they always get the opportunity to submit their own proposals on tax policy plan for the year and in terms of planned expenditure for the year to the duty bearers before the budget preparation. In the 2017 Citizen's Budget, the Minister of Finance of Ghana during his presentation to the legislature acknowledged the participation of civil society organizations in the preparation of the budget. This, therefore, confirms that civil society organizations participate in the formulation of the budget.

### Budget Review and Analysis

The stage at which civil society organizations participate the most is the budget review and analysis. When the budget is presented by the Minister of Finance to the legislature, civil society organizations take up the role of reviewing and analyzing it. The World Bank (2002) identifies that civil society organizations inform and train parliamentarians on the budget, create awareness of pro-poor issues, and demystify its technical content, among others. Indeed, civil society organizations also perform such roles at the participatory phase of the budgetary process.

A respondent narrated that:

> For us, when the government comes up with the budget every year, we do an analysis of the budget, we compare with the previous year to look at how this new budget is different from the previous year's budget.

Another respondent also corroborated that:

> When the budget is presented and has become a property of Parliament, this is where we engage parliament. We issue an analysis of the budget and the idea is to get parliament to have a third view of the budget from the perspective of the citizens so that in their discussion and debate of the budget, they are guided by what the aspirations of the citizens and civil society are so that they will able to make the right decisions as to whether to ask for revision or reject a particular ministry's budget (allocation).

This claim was supported by a letter from the Speaker of the Parliament addressed to a civil society organization inviting them to engage the parliament on the 2017 budget. In relation to demystifying the budget, one respondent narrated that his organization engages in public education and public sensitization. To "demystify" is to explain the budget in nontechnical language for the public to understand and appreciate its contents and what it seeks to achieve. In his words, "when the budget is presented, it is a big document, we take the document and break it down. We present it into readable formats for people to easily understand it."

Findings from South Africa and India have shown that civil society organizations like the Institute for Democracy in South Africa (IDASA) and the Development Initiatives for Social and Human Action (DISHA) in India perform a budget review and analysis functions in their respective countries (World Bank 2002). DISHA is noted to be unpacking and demystifying the data in the budget to enable the legislators, media, and citizens to be able to quantify the allocations made. IDASA in South Africa has also been reported to be improving the budget literacy through training, community radio, newspapers, and the Internet. The Ghanaian situation is not different from the cases of South Africa and India.

## Conclusion

This entry tries to fill the gap by contributing to the literature on the non-auditing role of civil society organizations in public financial management using the case of Ghana. The entry presents findings from Ghana to support the assertion that even though civil society organizations are not mandatory stakeholders, they still have a role to play as permissive stakeholders in the management of public finances. From the entry, civil society organizations in Ghana are playing a positive participatory role and achieving relatively good results which compare favorably well with their counterparts in some parts of the world. It is proposed that civil society

organizations should be accorded official recognition and integrated into the public financial management process. By so doing, they will see their role more of an obligation than a responsibility.

## Synonyms

Cultural approach to crisis management; Cultural approach to disaster management; Cultural approach to emergency management; Cultural diversity in crisis management; Managing cultures in disaster; Managing diversity in emergency and crisis

## Definition

Cultural approach to emergency management is a systemic process incorporating cultural knowledge, awareness or sensitivity, attitudes, skills, and encounters in order to provide both effective and appropriate care, relief, support, and services to diverse communities at risk from disasters and crises.

## Introduction

Culture includes shared values, meanings, beliefs, and norms of a particular group. An individual's cultural background and understanding of another's culture guides them to interpret a social phenomenon and respond to the event. People of diverse organizational, ethnic, or religious customs or experiences have distinct understandings and behaviors in crises and emergency situations. Therefore, cultural understanding and adaptation is necessary for effective crises and emergency management.

## Culture

Culture is not limited to racial, religious, ethnic, and sexual orientations and social institutions. Culture implies a totality of human behavior including beliefs, communications, customs, and values (Office of Minority Health [OMH] 2013). Culture is embedded within group-level interactions, and it is both manifesting and established by norms, attitudes, and behaviors of individuals (Douglas 1982). Culture can be examined at the national, regional, or local level. In addition, it can also be examined with a longitudinal perspective as people of different generations carry with themselves different cultures. These various levels of culture may overlap, but are not necessarily compatible and may result in conflict. Thus, what works in one culture may not work in the other, and the differences may lead to misunderstandings and conflicts.

## Culture and Emergency Management

Cultural differences are notable in crises. Any crisis, regardless of type, size, cause, and location, can affect multiple individuals and communities and highlight their culture in an unstable and time-sensitive setting. For example, different languages may be spoken on site between responders and community members. Moreover, diverse organizational, ethnic, or religious customs or experiences can be present, such as different ages, marital statuses, experiences, and abilities among the people involved in the crisis.

Cultures provide essential information in emergency management (Florida Center for Public Health Preparedness [FCPHP] 2017; Bergeron 2014). Firstly, culture indicates which services are necessary for specific groups exposed to a crisis (FCPHP 2017; OMH 2013). Services and goods necessary for females in crisis may be different from those for males. The same logic applies to different language groups. Demographic and geographic information will help managers identify at-risk populations and services necessary to them. Secondly, the cultural background of a community reveals what services/goods are accepted or desired by a particular group of people (OMH 2013). Individuals with distinct cultural backgrounds may require different kinds of services. For instance, should the crisis necessitate relocation then some survivors who share a strong communal culture may not want to be relocated to shelters that separate family members regardless of the reason for separation. Lastly, culture indicates the way people perceive the emergency situation and obtain crisis information (OMH 2013). Researchers have found some ethnic groups tend to avoid information from formal sources, such as government officials, preferring informal sources, like family or friends.

Culture also affects communication and coordination among diverse stakeholders, leading to different results in crises management (FCPHP 2017; OMH 2013). Constant communication among diverse stakeholders is critical in arenas such as emergency management. The performance of emergency management is highly contingent on the level of coordination and collaboration among entities affected by disasters. As cultures are associated with values, norms, attitudes, and actions, people with matching cultures are more likely to trust and communicate with one another in a crisis, while people with different cultural backgrounds may experience difficulties in doing so (Mileti 1999).

If cultural differences are not recognized, then they may induce conflicts and impede coordination among diverse stakeholders in emergency management (Bergeron 2014). In particular, cultural misunderstandings between responders and affected individuals could delay the disaster relief process or aggravate the crises situation. For instance, if emergency services and programs are delivered in English only, other linguistic minorities within the affected community may not have their needs met. As a result, the population's initial vulnerability increases within the disaster. Therefore, culturally appropriate and adaptive methods may improve the quality and effectiveness of emergency management (Canton 2015; OMH 2013). In contrast, culturally ignorant plans and approaches may cause undesirable results.

## Cultural Approach to Emergency Management

Given the strong presence and impact of culture, a culturally competent approach is essential to effective crisis management (FCPHP 2017; Mileti 1999). A cultural approach encourages constant learning, communication, and coordination among diverse stakeholders and helps identification and utilization of appropriate methods (Bergeron 2014).

Utilizing the four phases of emergency management (i.e., mitigation, preparedness, response, and recovery) can assist in generating or adapting current practice into culturally competent approaches.

Mitigation aims to minimize the impact of emergencies and prevent future occurrences. Tension or conflict between different cultural groups may exacerbate future crises situations by impeding interactions and communications between groups. To minimize or prevent adverse impact from cultural conflicts in future emergencies, cultural competency training for emergency management professionals is essential. Cultural competency training enhances the knowledge, skills, and abilities of professionals and influences their behaviors, attitudes, and policies in a way that enables effective collaboration within cross-cultural situations.

Federal agencies recognize cultural competency training focuses on facilitating (1) awareness and acceptance of difference, (2) awareness of own cultural values, (3) understanding and managing the dynamics of difference, (4) the development of cultural knowledge, and (5) ability to adapt activities to fit into different cultural contexts (Federal Agency of Emergency Management [FEMA] 2011). The first step of developing cultural competency is to recognize diversity and respect the value of other cultures as well as one's own cultural value. This allows individuals to identify biases when interacting with others from different cultures. The reflection also helps to evaluate personal prejudices and cultural stereotypes and cultivate responders' awareness of diverse cultural beliefs and capacity. It also enhances quality care to diverse populations and the ability to overcome difficulties caused by dissimilar backgrounds. The results of the training may alleviate cultural tensions or conflicts between responders and victims and support effective communication and resilient collaboration among them. Furthermore, the training mitigates future emergencies by enabling responders to use culturally diverse knowledge, skills, and attitudes in practice.

Preparedness involves identifying hazards that threaten people's safety and developing a comprehensive plan for community activities. The responders' knowledge of a particular community's cultural context along with response capacity (i.e., cultural and geographic isolation, residential patterns, cultural or language differences between a community and the responders, level of preparedness of the minority groups) may help managers identify potential cultural barriers to hazard preparedness and develop appropriate plans to address cultural factors (FCPHP 2017; FEMA 2011; Andrulis et al. 2007).

Community outreach helps managers and responders identify cultural factors and foster cultural understanding as well as build trust with community members (FEMA 2011). First, managers can assess cultural characteristics of the target community, such as racial groups, primary languages, and socioeconomic status. This assessment helps managers understand the community's needs and anticipate potential attitudes in crisis situations. Second, managers can evaluate the community's resource inventory, such as physical and human resources and services available for future disaster response (FEMA 2011). Moreover, responders can minimize redundant services and goods and focus on what is lacking in the community. Third, community outreach allows managers to interact with local leaders and residents. It also creates an opportunity to educate and engage locals in disaster prevention and preparedness. The benefits from community outreach help managers build a disaster-specific, culturally sensitive, and adaptive response plans (FEMA 2011).

The sole focus of response is to minimize the impact of the disaster. In this phase, responders need to make sure that culturally proficient response services are distributed fairly across communities. Culturally competent services can more effectively cope with emerging demands

and concerns across cultures. For example, cultural adjustment of shelter operation is effective in international disaster response, such as gender-based evacuation and separation for Muslim communities who prohibit cohabitation. Another example is the provision of shelters accommodating all family members within Asian communities due to their collectivistic culture. In addition, linguistic competency supports fair distribution of appropriate response services. For instance, mandatory interpretation services provided by the US 9–1-1 call centers allow linguistic minorities to receive culturally appropriate response services at the right time (Futty 2007; Kelly et al. 2006). Culturally competent response services support timely communication and coordination across communities and contribute to minimizing the initial devastation from the crisis.

Recovery includes both short-term and long-term efforts aiming to return an affected area to a sense of status quo or normalcy following a crisis. This phase focuses on restoring not only physical but also psychological conditions of the community. In this phase, emergency responders need to make sure that every affected community receives the right messages and assistance, and those messages and types of assistance are culturally and linguistically appropriate. To rebuild the community, emergency management agencies can collaborate with local groups, such as nonprofits, health services, and faith-based organizations. These local partners know the community better and can quickly identify culturally appropriate recovery services by observing and interacting with local leaders and residents (OMH 2013). They can also bridge the language gap between the outside agencies offering recovery assistance and the disaster survivors who are trying to rebuild their lives.

## Conclusion

Cultural approach is critical for effective emergency and crisis management (Candon 2015). The significance of the cultural approach lies in cultural competency of involved stakeholders: the ability to understand diverse cultures, and adapt methods to emerging needs during disasters and crises. Cultural competency helps communities understand own cultural vulnerabilities, develop specific intervention plans, and utilize appropriate methods to cope (OMH 2013). Moreover, cultural competency contributes to building resilient communities by encouraging constant learning, communication, and coordination among diverse stakeholders (Bergeron 2014). Therefore, cultural approaches need to be incorporated in all phases of emergency and crisis management.

# Cultural Competence in Nonprofit Organizations

Christa L. Remington
Florida International University, Miami, FL, USA

## Synonyms

Cross-cultural competence; Cross-cultural skills; Intercultural competence; Multicultural competence

## Definition

A set of behaviors, policies, and attitudes which enables effective service delivery between various racial, ethnic, religious, and linguistic groups.

## Introduction

In the nonprofit sector, cultural competence is essential to the successful outcome of nonprofit programs. A commitment to cultural competence is not only important at the individual level but also at the organizational level. Nonprofit organizations commit to ongoing learning about the cultural identity of their constituency and to developing the cross-cultural skills that will help them to operate more effectively in their mission. Cultural competence increases the capacity of the organization and enhances trust between nonprofit organizations and those they serve. Cultural competence is a developmental process that can be measured along a continuum as organizations increase their awareness, skills, and knowledge.

## Background

Intercultural research has furthered our understanding of the similarities and differences in human culture. The body of research on cross-cultural competence stems mainly from private business, military defense, and industrial and organizational psychology. The term *multicultural competence* was first used in a 1988 mental health publication by psychologist Paul Pedersen. Since then, multiple definitions have emerged. Cultural competence broadly refers to a set of behaviors, policies, and attitudes which enables effective service delivery between various racial, ethnic, religious, and linguistic groups.

The term culture refers to an integrated pattern of human behavior that includes thought, communication, actions, customs, beliefs, values, and institutions of a specific racial, ethnic, religious, or social group. The term competence implies the ability to function effectively and to specifically meet an organization's stated goals while adhering to its values and vision.

Much of our current knowledge on the actual practice of cross-cultural management comes from the private sector. Research, such as that done by McCall and Hollenbeck (2002) and the works of Jay Galbraith (2000), focuses on cross-cultural competencies within the context of the multinational partnership and is geared toward helping global executives become more effective at communicating, establishing relationships, and conducting business while living abroad. Organizations such as GE and Royal Dutch Shell have spent decades researching the cultures in which they are enmeshed and honing their organizations' cross-cultural processes and competencies (Zweifel 2003).

The National Center for Cultural Competence defines cultural competence as a "set of cultural behaviors and attitudes integrated into the practice methods of a system, agency, or its professionals that enables them to work effectively in cross-cultural situations" (2001, 9). This includes a wide variety of both hard and soft skills, value systems and dynamics, and organizational processes and structures that allow the organization to learn, adapt, and better fulfill its specific goals. Agencies committed to being culturally responsive must train their staff in areas that affect their constituency and must set the tone for their employees through policies, hiring practices, and ongoing learning.

## Dimensions of Cultural Competence

Cultural competence can be divided into the areas of awareness, knowledge, and skills. *Cultural awareness* refers to values, attitudes, and assumptions that are vital for successful communication with clients who are culturally different from the service provider. Awareness requires self-evaluation, self-reflection, acknowledging one's stereotypes, biases, or culturally based assumptions, and understanding how their culture is perceived by members of other cultures. *Cultural knowledge* involves understanding the worldviews of various cultural groups. This includes knowledge about the history, values, attitudes, and behaviors in other cultures and how members of other cultures interpret their own rules, customs, and laws. *Cultural skills* are the appropriate behaviors, interventions, and strategies resulting from the cultural awareness and cultural knowledge.

Rosen (2000) identifies four dimensions of cultural competence that he terms "global literacies." These four dimensions comprise a simple, robust framework for identifying the skills, values, qualities, and practices that are part of intercultural efficacy. Based on findings from a 4-year study involving more than 1000 international business leaders from organizations and nations around the globe, Rosen's global literacies are as follows: (1) Personal literacy- this dimension includes that which is internal and personal, including an individual's capacity for self-awareness, self-esteem, and self-development. (2) Social literacy- this second dimension covers the soft-skills needed to collaborate in a shifting global environment, such as pragmatic trust, urgent listening, and collaborative individualism. (3) Business/technical literacy- this includes the ability to institutionalize practice in varied global contexts and to effectively navigate chaos. (4) Cultural literacy- this final dimension covers both explicit cultural knowledge and the implicit cultural mindset that makes learning, synthesizing, and utilizing such knowledge and experience possible in cross-cultural scenarios.

Rosen's findings mirror those of countless other studies. Adler and Bartolomew (1992), for example, identify five cross-cultural competencies that global leaders must develop in order to improve global team effectiveness. First, public servants must be able to understand worldwide business, political, and cultural environments. Second, they must learn the perspectives, tastes, and language of the targeted culture. Third, they must be able to work simultaneously with people from different cultures. Fourth, they must have the ability to adapt to living and communicating in an unfamiliar culture. Fifth, they must relate to people from other cultures from a position of equality rather than cultural superiority. These competencies, they assert, prepare public servants for effective conflict resolution, communication, stress coping, language acquisition, and adapting to working with those from another culture. The learning process is more than transmitting culturally specific knowledge. Intercultural competencies are translatable across language, culture, and chronologies.

## Organizational Cultural Competence

Culturally competent organizations are characterized by policies that reflect a commitment to effectively serve diverse populations, whether in multicultural scenarios or in culture-specific contexts. In addition to policies and worker training, culturally competent organizations should include input from diverse communities and individuals in order to develop culturally appropriate programs and culturally responsive service delivery. The impact and efficacy of these practices can be measured by setting organizational goals and providing a cultural competency continuum to monitor progress.

The culturally competent organization seeks to hire diverse and unbiased employees. This includes hiring qualified employees from the organization's constituency, when applicable. Ongoing learning is also a characteristic of a culturally competent agency. It is continuously assessing the organization to identify its progress toward cultural competency and providing opportunities for staff to increase their cultural knowledge through training and participate in self-assessment.

## Cultural Competence in Public Service

While best practices and cross-cultural assessments are fairly common within private sector domains, the public sector has largely ignored the critical role that culture plays in public service. Research demonstrates that an understanding of culture, which refers to the norms, roles, belief systems, laws, and values that are interrelated in meaningful ways, is critical to cross-cultural communications and program effectiveness. For public servants, working with different cultural groups is often a challenge and more frequently a source of conflict. Cultural differences encountered during service transactions are frequently laden with misunderstandings, frustrations, and disagreement.

Cultural competence first requires an understanding of the cultural context in which any direct public service encounter occurs. The ability to recognize and respect similarities as well as differences in belief systems, values, and approaches is critical to becoming culturally competent. Subtle cues, expressions, and tones of voice, which are taken for granted in one's own culture, may have vastly different meanings cross-culturally. Within multicultural settings, what constitutes appropriate behavior may vary greatly and is often bound by religious traditions, historic gender roles, and a culture's unique sense of power distance.

While the private sector has invested significant resources in researching cross-cultural competencies and efficacious intercultural models, the nonprofit sector is only recently coming to recognize both the moral and strategic need for prioritizing cross-cultural competencies. The lack of funding and professional training and a sector-wide failure to recognize the relevance of cross-cultural competence to the organization's bottom line have left most organizations with little time and interest in intercultural dynamics. Yet the impact of cross-cultural competencies on organizational efficacy is profound and can influence everything from donor relations to staff satisfaction to relationships with beneficiaries and local governments.

## Cultural Competence in Disaster Response and Recovery

Cross-cultural competencies are critical to successful communication and program effectiveness in the aftermath of a disaster (Storti 2007). Cultural norms play a powerful role in communication between co-workers and between aid workers and beneficiaries during the best of times. Disaster and stress serve to amplify cultural differences, making cultural competence a vital post-disaster skill. Where cultural competence does not exist, misunderstandings, frustrations, and stress abound, often undermining organizational goals and confusing processes.

Because of the global nature of aid work, it is vital that individuals possess a wide set of cross-cultural competencies in order to adapt programs to new cultural contexts, to communicate effectively with minority groups, and to work with and manage culturally diverse employees. Disaster response and recovery operations bring together international staff, often from vastly different geographic regions and cultures. Due to the multicultural and multiethnic makeup of many disaster response and recovery agencies, daily exchanges between those of different cultural backgrounds, beliefs, practices, and language are inevitable. These individuals are charged with forming effective teams and establishing good communication, cooperation, and understanding, all critical in a post-disaster environment.

Disaster response and recovery operations require direct interaction with beneficiaries. This requires the aid worker to deliver services and communicate, often in a foreign language or with the use of a translator while navigating unfamiliar societal and cultural norms. The sustained effort of cultivating trust and communicating comfort and understanding within an unfamiliar culture easily leads to misunderstandings, heightened suspicions, and reduced program effectiveness. Because disasters are dynamic in nature, in order to be effective, response and recovery workers must develop the capacity to quickly adapt their behavior to these new cultural contexts. This adaptive capacity refers to an ability

to learn new, culturally integrated patterns of human behavior and apply them in appropriate situations.

## Cultural Competence Continuum

Cultural competence is a goal toward which agencies must continually strive. Becoming culturally competent is a developmental process which should be routinely measured according to the specific priorities and goals of the agency at an organizational level; cultural competence is organized along a continuum, with cultural destructiveness at one end and advanced cultural proficiency at the other (see Fig. 1) (Betancourt et al. 2002).

First, agencies should decide where they fit along the continuum by honestly assessing current policies and internal practices. Strategic adjustments can be made and policies implemented to help the organization move along the continuum toward the goal of advanced cultural competence.

**Cultural Destructiveness** At the extreme end of the cultural competence continuum is cultural destructiveness. An organization on this end of the continuum has attitudes, policies, and practices which are purposefully destructive to cultures and individuals within that culture. This includes the intentional violation or shaming of cultural norms and denying or withholding care in a way appropriate to one's religion. Historically associated with colonialism, racism, and cultural domination, cultural destructiveness is the furthest point of inefficacy and harm for a nonprofit organization (e.g., the removal of Native American children from their families into boarding schools). Nonprofit organizations are often in the position of being the sole provider of essential services (e.g., food, water, shelter), thus creating a power differential between the organization and those being served. This power differential allows the organization to disenfranchise, control, or exploit those relying on their services and to silence voices and critiques through the intimidation of resource control.

**Cultural Incapacity** The next position on the continuum is cultural incapacity. Unlike cultural destructiveness, these organizations are not purposefully culturally destructive. Rather, subtle attitudes and biased policies place the organization in a paternal position toward those considered lesser. These organizations may disproportionately apply resources, have discriminatory hiring

**Cultural Competence in Nonprofit Organizations, Fig. 1** Organizational cultural competence continuum

practices, and make eligibility for services or resources contingent on assimilation.

They may hold generally lower expectations of minority clients and operate under the assumption that their own cultural norms are "normal" and that what is different in the culture of their constituency is "less" or in need of change.

**Cultural Blindness** Organizations who fall at the midpoint of the continuum are considered culturally blind. Often, these agencies hold the view that all clients are equal and that services do not need to be adapted to fit specific cultural groups. While these agencies view themselves as unbiased, their policies exclude many groups which are not from a middle-class, nonminority demographic. This can include the minimization of a client's cultural or religious context and the dismissal of minority concerns as being "irrelevant" to the situation or services provided. By failing to recognize diverse yet equal realities, nonprofit organizations at this point of the continuum may ignore a culture's valuable contributions or insist that victims are to blame for their situation. Often, minorities are viewed as culturally deprived and only in need of the enlightenment the organization can bring in order to transform their situation. This unrecognized ethnocentrism can be the result of lack of training and a dearth of information about the nuances of culture and the population being served.

**Cultural Pre-competence** The culturally pre-competent organization is one that has realized its deficiencies in serving minorities and has taken steps to address them through policies, training, and practice. These organizations may begin to assess the needs of minority groups and initiate policies related to the recruitment of minority staff and volunteers. Instead of being integrated as part of the life of the organization, pre-competent organizations treat cultural competence as a special event that requires occasional training or certification. Having fulfilled training requirements, these agencies may feel a false sense of accomplishment and may stop progressing. While these organizations are further toward the positive end of the continuum, they still fail to understand the dynamic nature of cross-cultural work and the need for continual learning, growth, and adaptability.

**Basic Cultural Competence** Organizations with basic cultural competence have an organizational culture of respect for differences and internal scrutiny and seek to access a wide variety of intercultural resources. They are learning organization, committed to cross-cultural growth and to listening to the needs of minority populations which are served by the agency. These organizations recognize their own limitations and, as a result, seek out advice and guidance from organizations and individuals that can help them see their own blind spots and craft more effective practices. While they may still struggle with achieving full competency, nonprofits with basic cultural competence are committed to growing and changing in this area with intentionality.

**Advanced Cultural Competence** At this far end of the scale, we find cultural proficiency which is the most advanced form of cultural competence within the nonprofit organization. Culturally proficient models place a premium on cross-cultural competence and see intercultural differences as qualities worth celebrating, learning from, and incorporating into the life of the organization. Such agencies are advocates for best practices, constantly adaptive, and resources for other organizations. For them, cultural competence is not ancillary but a key component of both values and practice. Their commitment to inclusion and participatory programming helps them build strong relationships of trust with diverse members of their organizations as well as better connecting with and serving their beneficiaries.

## Conclusion

The degree of cultural competence achieved by a nonprofit is a result of purposeful steps taken to increase the organization's cultural awareness,

knowledge, and skills. To move along the continuum toward cultural proficiency, an organization must intentionally identify and root out ethnocentrism within itself and proactively change both policy and practice. Attitudes, priorities, and structures may need to be altered significantly, and time-honored practices may need to be changed. Because cultural competence increases capacity of the organization and establishes trust within its constituency, the development of intercultural skills, policies, and structures is of strategic as well as moral significance.

## Introduction

The Black experience in America is filled with a history of pain, distrust, trauma, and increased stress, all of which hurt this population's adaptive coping and overall mental well-being. The stigma associated with mental illness is just one barrier that prevents African American people from engaging in mental health care. With that in mind, practitioners need additional guidance to build the infrastructure and relationship to respond to Black communities' needs related to mental and behavioral health and substance use disorder, including domestic violence, child abuse, unemployment, despair, and suicide. While issues of depression, anxiety, and substance use among the African American community is historically high, the most recent Impact of COVID-19 has had a profound impact on people of color with increased crisis-induced trauma (Baptiste et al. 2020a, b; Krieger 2020; Pratt and Frost 2020). Mental illness, adverse childhood experiences, and related domestic violence issues are at an all-time high (Alegria et al. 2010; Pratt and Frost 2020; Zhao et al. 2020). In this project, consideration for problems that may arise when practitioners, educators, leaders of the faith-based communities, and the judicial system fail to consider race, ethnicity, health equity, and their impact on African American's health disparities is paramount to affecting positive change.

This systemic integrative literature review consists of 20 academic articles and 25 pieces of gray

literature, which include blogs, personal narrative, factsheets, and advice columns, and aims to: (1) identify what research regarding the African American cultural experience in acquiring and navigating mental health supports; with a summarizing of findings focused on historical beliefs, practices, and actions that negatively influenced African American mental health and coping strategies; (2) conduct a comprehensive evaluation of the literature to find potential gaps related to the African American cultural experience regarding mental health, education, training, and service implementation; and (3) make recommendations for next steps and culturally responsive best practices to guide holistic, behavioral health, and mental practice, and recommend African American coping strategies that help Black bodies heal. Additional topics addressed will include the professional/ethical responsibilities of influencers regarding the Black/African American experience, including ethical and cultural dilemmas. The authors offer recommendations for strategies and interventions that reflect cultural humility.

## Research Method

Examining the cultural and societal elements that inhibit or minimize the likelihood of Black people accessing services for mental illness and substance use disorder treatment is critical. The authors endeavor to help the academic, medical, faith-based, correctional, and mental health community understand how to work with Black populations. The African American (AA) populations include individuals and families whose notions of mental disorders are not dissimilar to that of the dominant culture. However, ideas regarding mental illness are overshadowed by cultural, spiritual, social mores, and beliefs that might be in direct opposition to the perceived benefits of seeking help for mental illness. Professional health, mental healthcare providers, pastors, judges, teachers, and educators are increasingly interacting with "families whose race, culture, national origin, living circumstances, and family composition are different from their own" (Alegria et al. 2010, p. 1).

In this entry, the authors discuss distinctive characteristics of the AA cultural experience, the reason behind resistance to addressing mental health within the African American culture, and the barriers, stigmas, and myths of mental illness, as it impacts Black people. The authors consider how implicit associations in the subconscious affect AA communities. Racial minority families differ in their experiences, explanations, and mental illness manifestation and treatment (Alegria et al. 2010). In their article on the diverse, cultural context of mental health among minority populations, Alegria et al. (2010) define mental illness as "any current or past-year psychiatric disorders that result in functional impairment which substantially interfere with [a person's] role or functioning" (p. 2). However, these researchers recognize that many cultures see mental illness as a fatalistic flaw or personal defect thought to be incurable and embarrassing. Such stigmatizing beliefs generate feelings of shame and guilt, leading to distorted help-seeking patterns.

The literature review derives from scholarly peer-reviewed journals and nonconventional sources, including gray literature and various social media forms. The authors approach studying the social and cultural processes that cause Black people to ignore, deny, feel shame about their mental health. Through a comprehensive review that provokes new insights into AA's mental and behavioral health, the reviewers consider a cultural perspective (Torraco 2016; Stigma – and Other Factors – Affect Blacks' Use of Mental Health Services 2018). This literature review sources use the terms Black and African American interchangeably; thus, this entry will do the same (Torraco 2016; Stigma – and Other Factors – Affect Blacks' Use of Mental Health Services 2018).

### Conceptual Structuring

Mistrust of systems stymies help-seeking behavior among AA people. The ongoing and warranted mistrust of systems at various levels impact the AA cultural experience. The authors explore this phenomenon's effect on African Americans' experience related to mental health and substance

use disorder. Individuals in leadership, such as pastors, community leaders, and societal authority figures, are considered influencers. Additionally, in the higher education systems and social media systems, influencers in the criminal justice system impact individuals from a multi-systemic, multi-dimensional perspective. Therefore, community, religious, and social agencies are typically more trusted as viable resources for confronting the hardships and stressors associated with their own and their family's living circumstances (Alegria et al. 2010; Gonçalves et al. 2015; Here is What African Americans Are Doing To Address Mental Health And Its Stigma This Year 2018; How Churches are Addressing the Mental Health Needs of the Black Community 2018). Expectations of misunderstanding and coercion within traditional institutional services (e.g., school, police, and government services) discourage Black people from seeking professional mental health care (Vu 2011; Persaud 2019). As a result, there is a gap in the offerings of mental health service correlated to the negative experienced and unmet needs of Black people, especially children and youth (Vu 2011; Williams 2014; Lewis 2016; Stigma – and Other Factors – Affect Blacks' Use of Mental Health Services 2018).

While there is no single unchanging statement that encompasses the core tenets and perspective that explains the AA cultural experience, this review is the conceptual foundation of Urie Bronfenbrenner (1986). In ecological systems theory, the individual, family, community are interrelated social influences. In his seminal explanation of the ecological perspective, Bronfenbrenner highlights the "influence of external environments on the functioning of families as contexts of human development" and explains how external systems can influence individual, family, and group functioning and interactions (p. 723). The external influences of five different environmental systems include the Micro, Meso, Macro, Exo, and Chronosystem. The authors will focus on the Meso system's role, the Exosystem, and the Chronosystem for this review. Integrating the ecological perspective throughout this literature review helps connect concepts related to the AA cultural experience. The present review's relevance lies in the fact that ecological systems can indirectly influence the cultural experience by affecting individual and family processes, coping strategies, and resilience aspects (Bronfenbrenner 1986).

### Literature Search Strategy

This literature review involved an environmental scan of the peer-review literature in addition to gray literature (magazines, news, blogs, and social media). The process of gathering information about barriers to mental health supports for African Americans included scholarly sources and sources that chronicled the events and their relationships within the population's cultural context. According to the critical race theory (CRT), grounding academic understanding in the African Americans' cultural context and lived experiences serves to center the lived experiences. Black folks' lived experiences, traumatically impacted by racialized marginalization exclusionary tactics (Gillborn 2015). Counter storytelling refers to a method that provides a space for African Americans to express experiences, feelings, and stories to challenge and examine the dominant White culture's narrative about their lived experience through a dominant and often white supremacist lens (Quiros et al. 2019). Engaging in this process for the literature review supports culturally responsive findings in their inception and in determining the future direction of the research, prevention, and intervention methods used to address this culture.

An extensive search for articles on topics and theoretical frameworks addressing stigma, mental health, and AA experience, the role of spirituality and religion in guiding AA attitudes, beliefs, and behaviors about mental health took place in the peer-reviewed and gray literature. Additional authors looked at resiliency's role (e.g., internal locus of control, social support, family support) on Black peoples' coping. The authors conducted a meta-analysis of the literature related to the topics above. The authors analyzed 53 artifacts and created an excel spreadsheet that tracks each piece and assessed the content to identify design, assessment tools, the population the tools were normed on, results, and findings. Of the articles

reviewed for this analysis, 50 percent indicated the data collection methodology. Twenty-five percent engaged in some form of qualitative research techniques. Other methodologies of the literature included quantitative methods, secondary data analysis, and theoretical analysis. The articles chosen were a mix of formal academic, scientific writing style, theoretical discourse, and gray literature, including fact sheets, personal narrative pieces, and opinion pieces. Our ability to develop a research design for further exploration and foundation for our methodology is the outcome of this exercise. The authors identified existing assessment and evaluation tools that address African Americans' cultural appropriateness and compiled information about the tools through this search.

### The Systems Model and Ecological Perspective

According to the ecological theory developed by Brofenbrenner (1986), five environmental systems can influence resilient responses, ranging from individual characteristics exhibited by youths to direct interactions with social agents and even broader influences of culture on responses to stress. Waller (2001) identifies five components of this ecological system:

1. Microsystem: consists of people with whom adolescents come into direct contact. Within this system, protective factors include the individual's internal characteristics and relationships with family, peers, school staff, faculty, community centers, and church.
2. Meso System: represents relationships between components of the microsystem. For example, interactions between adolescents and school counselors, family members, or church friends function at the mesosystem. The mesosystem considers the community's multiplicative effect on individuals. The negative and positive impacts of school, church, and community organizations on black families continue as a phenomenon.
3. Exo-System: involves the influence of such mediating or moderating entities as political forces, policy-making agencies, social welfare services, legal services, and state educational commissions. The last year has created an opportunity to observe the continued evolution of policies and laws that adversely impact Black people. The events of 2020 elucidated American's continued struggle with racism and racial disparities. The exosystems are those policies and laws designed to promote racist acts, attitudes, and actions with little to no accountability. Systemic racism for the Black family hinders their ability to earn a livable wage, move out of poverty, and escape civil injustice (Baptiste et al. 2020a, b). Racism has a compounding impact across generations. Barriers to accessing mental health support further highlight the disinvestment and disenfranchisement for Black communities. Discriminatory acts of aggression and oppression against Black people are where individuals can begin to look at a cultural perspective of how African Americans navigate life and formulate coping mechanisms (Smith et al. 2011; Benner et al. 2018; Bonilla-Silva 2019).
4. Macrosystem represents historical and cultural forces like ethnic identity, Afrocentric paradigms, and sociocultural perspectives, minimizing risk factors' adverse effects.
5. Chrono System: comprises interconnections and transitions between individuals and their environments over the life course. As a result, exposure to multiple and diverse inequities across generations increases stress and triggers many Black folks' dynamics like poverty, poor physical health, and depression (Verschelden 2017; Jones et al. 2019). The Chronosystem model looks at the progressive impact of how lived experiences can transition to family processes and ultimately impact a culture. One example is the concept of transgenerational trauma, which is characterized by continued oppression with limited to no access to positive benefits available in society. Aspects of transgenerational trauma overshadow Black lives and often manifest as individual and family trauma.

The overwhelming predisposition to depression, anxiety, hypervigilance, substance use disorder, along with more severe mental illness

diagnoses, is understandable. Dr. Rochelle Dunham (2019), the Metropolitan Human Services District executive and medical director in New Orleans, LA, notes that the African American condition in the United States of America, layered with profoundly traumatic experiences, began the seventeenth through the eighteenth centuries. These experiences included involuntary servitude perpetrated against people of the African diaspora, considered "sub-human." Atrocities, torture, rape, and the use of violence to garner submission are not only dehumanizing, but they have been used historically as psychological tools to promote and justify the economic gain for whites throughout the history of America.

Dr. Dunham further notes that systemic inequities created the marginalization that makes it impossible for AAs to overcome without honest, reflective work that acknowledges the history of multiple traumatic events perpetrated by the privilege held by some. Inequities exist in all spaces. The psychological burden of bearing this belief reinforces the trauma (2019). Some behaviors have generated levels of resilience and positive coping. However, maladaptive forms of coping have adverse outcomes. The use of alcohol and drugs to cope with societal inequities and disadvantages is just as much a part of the Black experience as prayer and faith (Degruy 2017).

### Historical Context of Racism in Health Care

It is essential to consider resilience in a holistic context. Henderson et al. (2016) and Theron et al. (2015) characterize the ecological perspective as a conceptual framework that looks at the relationship between people and their environments. How the environment influences individual development and how individuals change the environment composes this interactive process. For example, adolescents at risk in one area, such as in dysfunctional family interactions, are likely to be at risk in other areas, such as academic performance, without a significant buffer somewhere in the environment (e.g., via supportive relationships with school counselors). Waller (2001) considers resilience to be multidimensional.

In considering the work across systems, the literature review illuminated three major themes to consider: historical contexts of inequity, cultural competence from an ecological lens, and spirituality as a form of resilience. Because of racist ideology, further reinforced by policies, practices, and procedures such as slavery and social inequities, African American people often experienced discrimination in housing and education. Other areas where discrimination presented challenges include eugenics, medical experimentation, and state-sanctioned violence on Black people. Overall, mental health conditions, exacerbated by the historical sovereign and physical dominance by the power holding whites, aggravated collusion. The delusion of dominant ideologies and narratives further hindered African American progression (Su Rasmussen 2011). The literature suggests that there are diverse types of historical contexts to be considered in supporting resilience. Firstly, Pan-Africanism and the origins of religions can help practitioners understand the importance of religion in the AA community (Capone 2007). Secondly, the historical mistreatment of the Black community by providers is documented in the literature and serves as the foundation of medical practice and discovery (Washington 2006; Baptiste et al. 2020a, b). It is important to note that substantial amounts of qualitative research in the gray literature and narratives (oral & written) support this for generations (Brondolo et al. 2009). There is also evidence to support that racism is a driver for a consistent lack of access and barriers to care (Washington 2006; Baptiste et al. 2020b).

Black people are less likely to seek professional help that addresses behavioral, mental, and substance use and abuse due to harmful life taking experiences across generations. An analysis of academic literature and gray literature shows unique factors to consider when studying mental health in the AA community (Cuevas 2013). The role of religion, spirituality, and Faith serves as an essential part of AA communities' relationship to mental health.

However, resiliency, resulting from protective factors, can minimize the impact of negative cross-generational experiences on individuals' ability to employ positive coping skills. For example, Lacy (2005) found that individuals overcame

challenges and achieved success and advancement goals despite the environmental, social, and economic conditions and experiences (Edwards and Wilkerson 2018; Henderson et al. 2016).

### Spirituality

The literature makes a case for Faith, such as religion and spirituality, incorporated into mental health research as positive practices for AA communities. It is essential to acknowledge the historical roots of this recommendation. Spirituality and relationships within the religious communities function as a coping mechanism and source of mental health resilience. However, this mesosystem contributor has a connection to the AA that makes it both trusted support and, at times, a limiting gatekeeper (Matory et al. 2018).

These paradigms point to the historical, cultural, and spiritual structure, content, and practice as evidence of the transmission of belief systems and cultural values conducive to successful coping. Within the solutions framework, the concept of racial socialization is meaningful. The gray literature demonstrates standards of conduct in faith communities (family rules and beliefs) that AA implements, encouraging resilient behavior, beliefs, and values within faith circles (How Churches are Addressing the Mental Health Needs of the Black Community, 2018). This support system provides a keen sense of self and buffers against such life stressors as Racism (Gentry 2013; Matory et al. 2018; Dorsman 2019).

Findings in the literature indicate that culturally relevant coping tools such as religion, spiritual awareness, culturally transmitted personality traits, collectivism, and cooperation play a significant role in promoting AA's resilience (Lacy 2005; Edwards and Wilkerson 2018). Looking at spiritual health from a multidimensional standpoint, Black people do not have to attend church; but observe the behaviors of significant family and community members who attend church or exemplify spirituality through praying, singing, or talking about the goodness of their God. Black people may implement what they observe (e.g., a praying grandmother) in their own private lives. Services translate into action, and many times the spiritual songs become messages to encourage, give guidance, give direction, and provide a grounding for communities. Another demonstration is the connection between coping with substance use disorder and spirituality (Edwards and Wilkerson 2018). Clergy representatives who take up these roles are mental health providers, in this instance, offering prayers and words of encouragement (Gentry 2013; Matory et al. 2018; Dorsman 2019).

The literature also documents that many individuals who seek mental health services through the church are reluctant to receive this type of care anywhere else. Black people's conceptual beliefs about God (or their higher power), their relationship with a deity system, and how that deity affects their world can increase recovery likelihood. In this instance, they feel supported, watched over, protected, guided, and such feelings may promote more resilient behavior. Spirituality and religion, identified in the literature as a significant cultural value, serves as a critical factor in people's ability to cope with stress (Edwards and Wilkerson 2018).

When examining coping factors among African Americans, Lacy (2005) found that social support from spiritual health proved to be a statistically significant predictor of positive coping skills among African American/Black youth. Additional findings indicated that one of the most effective mechanisms through which resilience correlated with Black youth success occurred through spirituality's nurturance. Young people also characterize spirituality, identified as a significant cultural value, as a critical factor in their ability to cope with stress (Haight 1998).

Based on the literature, spirituality and relationships within the religious community function as a coping mechanism and mental health source. A clear focus is on the Black Church. Services were translating into action, and many times the spiritual songs were messages to encourage, give guidance, give direction, and provide a grounding for communities. There was even a connection demonstrated between coping with substance use disorder and spirituality. The clergy not only acts

as a spiritual guide but as a social provider. Clergymen who take up these roles are mental health providers in this instance. There is a potential burden on clergymen to provide this service. However, the literature also documents that many individuals who seek mental health services through the church are reluctant to receive this type of care anywhere else.

One area of significance not explored in the literature is the impact of leaders' ethical standards and behaviors (influencers) in Black social-emotional outcomes. Social injustices across generations in the name of "right and righteousness" leave Black people navigating life with traumatic consequences. Influencers have a critical role in ensuring that exemplary ethical practices people move toward equitable treatment and service (McEwen 2003). Codes of ethics hold professionals accountable to uphold quality, moral care for all individuals regardless of their race, ethnicity, or culture. When professional influencers fail to apply the same quality of care, they violate their ethics code, which ultimately violates a commitment not to harm. As influencers, individuals in leadership can benefit from understanding or learning the Black culture's moral norms (Whetten et al. 2006; Smith 2016). Doing so gives credence to the lived experiences and the limitations systemically inflicted on Black people.

## Results

Conversations around culturally competent mental health services in AA communities arise by analyzing academic literature and gray literature. In particular, the concept of resilience is of utmost importance. The premise that resilience, constructed through social interactions, is supported in relevant research and sets a foundation to expand the conversation around what accessing mental health services looks like in AA communities (Lacy 2005; Henderson et al. 2016; Theron et al. 2015). Through an analysis of academic literature and gray literature, it is evident that there are unique factors to consider when studying AA communities' mental health. The evidence base supports the idea that the role of religion, spirituality, and faith serves to be an essential part of AA communities' relationship to mental health. Churches specifically have a significant role in providing mental health services, and there is a trust in the church to provide these services.

In contrast, there is a deep mistrust within AA communities, which gives rise to feelings of despair generated by failed efforts to access help within the medical system. The literature reveals barriers in accessing mental health care, the historical context of the provider-patient relationship, and racism within the healthcare practice. Several resources published in the gray literature elucidate the healthcare system's impact on AA people – also, virtual resources in particular document coping strategies and interventions that focus on empowerment through community-based work. Notably, the literature provides useful tools to conceptualize what cultural competency looks like in this space. It explicitly designing interventions, understanding mental health within AA communities, and pedagogical practice to serve AA communities best; by looking at significant categories discussed above: spirituality, racism, and ethical considerations.

The literature analysis involved searching outside traditional academic articles and considering new epistemology points – personal narrative and gray literature. Gray literature, such as opinion articles and informal resource sharing sites, can be used as a point of epistemology to conceptualize thinking about intervention. Spirituality, used as a point of epistemology, includes healthcare practice development and intervention development, explicitly thinking about delivering mental health services. The DSM-5 does not precisely encapsulate the experiences and effects of racism; therefore, gray literature and additional theoretical reading can fill this knowledge gap. Racism is also defined clearly as a "healthcare issue" in the literature. This evidence from the literature offers tools on how to conceptualize barriers within health care. The leaders and influencers have a responsibility to ensure that their commitment to professional codes of ethics and their behaviors align in such a way that validates Black people's

lived experiences and embraces their cultural and racial differences. Doing so will provide tools to dismantle barriers and implicit biases within their practices actively.

## Conclusion

The literature examination informs us that African Americans' cultural experiences play a role in shaping care provision and access to care. Recommendations following the literature analysis enlighten practitioners and researchers on ineffective service provision and encourage ongoing evaluation and conversation to understand better how to build on the strengths of AA individuals, families, and communities.

The first recommendation is for practitioners to enhance the existing evidence base by using a more intersectional approach. There are gaps in the evidence base, and several populations can be incorporated to fill this gap in the literature. It is essential to mention that this evidence base is focused mostly on Black Christian traditions, excluding other religious practices in this review. The authors recommend expanding the conversation from just the Black Church to other religious minorities to be more inclusive. Furthermore, the authors recommend expanding the conversation to Black LGBTQ+ folks. Black transwomen die at higher rates, and this population is underserved. This population deserves more attention in the literature, as there is a notable gap in the current evidence base.

Additionally, this conversation should include Black Immigrant Communities since little literature studying this group exists. Lastly, additional research on age considerations is necessary. A good portion of young people move away from religious traditions and identify as spiritual or atheist – furthermore, complex relationships between churches and the LGBTQ+ community exist. Incorporate these populations into future literature, a systemic process of gathering information via qualitative processes, informal interviews can be developed and used to inform barriers to accessing mental health care. By developing this design, intersectionality between the dimensions of a lack of equity, diversity, and inclusion occurs while also recognizing academia's privilege.

Secondly, future literature should focus on a regional context. The current literature analysis adopted a more national context. Regional contexts are essential when discussing access to health care, as there are notable differences across regional contexts. Engaging various stakeholders and encouraging ongoing conversations with AA leaders in the four quadrants (areas of influence and interaction with AA clients and parishioners) encourages empowerment and self-efficacy. To include the church, the criminal justice system, the medical and behavioral health community, and the business community in the conversation ensures validation of the AA cultural experience. Additionally, a team of young participants and young scholars can be incorporated.

Third, further consideration for the COVID-19 impact on stress levels continued barriers to affordable health care, and appropriate coping is of utmost importance. Due to the Covid-19 pandemic, there are constant stress sources (Baptist et al. 2000). The research has indicated that trauma has intensified and presented challenges. There are feelings of despair due to joblessness and unemployment on the rise, given the economy's state. Further, COVID-19 increases the burden of working parents becoming serving as teachers and the additional burden of caretaking. The isolation of shelter in place policies can intensify depression and mental health struggles. Opioid usage has increased due to the pandemic, alongside domestic violence. Providing resources through a telemedicine environment has proven to be challenging. Access to telemedicine depends on economic status, reliable Wi-Fi, food security, and many other social determinants.

Next, we must consider other points of epistemology. It is evident through the original literature analysis that nonacademic and gray literature holds invaluable insight. Quantitative data gives us the ability to generalize the experiences of the larger group/population. Likewise, the quality of the culture's voice allows the researcher to gain an end-user perspective and validates the lived experience of those disproportionately underserved

and accommodated. Simultaneously, qualitative data allows us to clarify for different populations what those quantitative research numbers represent related to the individual's particular identity and experiences. The narrative allows us to get to the intersectional need and strengths of AA people generated as "cultural capital." Cultural capital, operationally defined as the social, emotional support and strength generated by mutually relevant lived experiences, gives credence to how Black folks talk about, sing about, write about, and pass on hope to the next generation (An and Western 2019).

A future step allowing us to expand on the last recommendation would be to include social media analysis and document analysis as methodologies to conceptualize resilience tools. A common theme arising from the review includes resource sharing, done through Instagram Threads and Facebook support groups. Resource sharing helps groups navigate the complex healthcare system or alternative care supports. Lastly, learning from community organizers would be incredibly important in this space. Practitioners and researchers should look to nonprofit and grassroots work to see how they help Black communities connect with support groups and host their support groups.

Future directions should continue to include literature reflections of lived experiences. Taking a reflective approach lends itself to guided questions as foundational to qualitative interviews. This approach helps identify research findings to validate the cultural experiences of African American people and communities. The opportunity to gather people's stories through informal conversations helps identify what the literature may lack. An Institutional Review Board (IRB) application is required to move any qualitative assessments of lived experiences and coping behaviors forward.

Moving forward in this research, practitioners must extend efforts to engage young scholars in the conversations about the African American experience. Young scholars bring fresh and innovative perspectives to the conversation. Connecting the seasoned experiences of a more mature generation with the energetic insight youth can produce noteworthy results, propel the conversations, and search for solutions toward merging care systems.

## Synonyms

Cultural characteristics; Economic development; Nature of development; Political development; Social development

## Definition

Culture refers to the wide spectrum of learned patterns of human behavior and it includes the way of life, the ability to live together, the framework of values, traditions and beliefs, as well as knowledge, art, and literature. In other words, culture is the heritage of a group of people living in a particular location, defining their distinctiveness including ideology, perception, values, beliefs, knowledge, material products, symbols, and behavior. Here, behavior means increased capacity, skill, and knowledge that makes life better for people in a globalized world.

## Introduction

The concepts of culture and development were not easily linked together until in recent years when the two concepts became highly inseparable due to the emergence of some elements and ideas which emphasize their connection. One reason being that for any (sustainable) development to be realized, cultural differences and dynamics must be considered, and for every local culture to meet up with contemporary global realities, it must be developed, hence, the interrelatedness of the concepts. Importantly, the significance of culture in realizing the global agenda of 2030 cannot be underrated. According to United Nations Educational Scientific and Cultural Organization (2020), recognition and promotion of cultural diversities in a human right–based approach is vitally important for creating conditions that will aid the realization of the Sustainable Development Goals (SDGs). In addition, experiences are showing how some cultures are highly resistant to some aspects of development, and how some others are embracing and developing faster. Considering the possibilities of cultural homogenization, heterogenization, hybridization, the development of local cultures to meet global realities becomes highly imperative (Oyekola 2018). To address these interconnected concepts especially in the context of global development agenda, this entry first explains the concept of culture and its characteristics before discussing it in line with three aspects of development: social, economic, and political.

## Culture

The term "culture" has several meanings and remains one of the few concepts difficult to define accurately. Some definitions of culture are suitable for appreciating quality literature, music, art and cuisine. For biologists, culture is expected to be a colony of bacteria or other microorganisms developing in the nitrogen medium of a petri dish laboratory. However, for anthropologists, sociologists, and other behavioral scientists, culture is the wide spectrum of learned patterns of human behavior. British pioneer anthropologist Edward B. Tylor used this concept for the first time in 1871 in his book entitled *Primitive Culture,* where he defined it as "that complex whole which includes knowledge, belief, art, law, morals, custom, and any other capabilities and habits acquired by man as a member of society" (Tylor 1924). Culture also includes the way of life, the ability to live together, the framework of values, traditions and beliefs, as well as knowledge, art, and literature. In other words, culture is the heritage of a group of

people living in a particular location and it defines their distinctiveness including their ideology, perception, values, beliefs, knowledge, material products, symbols, and behavior. Consequently, culture is regarded as a set of distinctive characteristics inherent in the social structure of every society, and championing the course of development in such society.

## Characteristics of Culture

Cultural characteristics are the embodiment of the lifestyles of social groups, because these characteristics are socially formed rather than genetically determined. As a comprehensive ideal concept of human understanding, belief and action, culture is the "road of reflection" for society. What is particularly fascinating about culture is that every culture has at least five basic characteristics, no matter where it is located. This suggests that the now extinct Troy civilization, for instance, had at least five basic characteristics that are common to today's African or European society. The five basic characteristics that all cultures have in common are that cultures are learned, transferred or shared, based on symbols, interconnected/integrated and dynamic (Scupin 2019). Scupin's (2019) description of cultural characteristics is discussed as follows:

(a) *Culture is learned and taught – not biologically based:* While biological traits such as individual personality and genotype are neither learned nor taught, culture has the capability of being passed to other generations through learning and teaching. It is important to note that most informal learning and teaching, as prevalent in traditional societies, are unconsciously based, unlike in the contemporary societies where norms, values, and knowledge are often deliberately learned and taught. Culture is taught by family members, organizations, and media, and the learning process is called socialization, which in turn leads to enculturation.
(b) *Culture is shared:* This characteristic explains the social nature of culture and demonstrates the importance of social interaction in the sharing of culture. Since we exchange culture with other people in society, we can behave socially and instinctively, and foresee how others will behave. However, the common nature of society should not mean that society is homogeneous.
(c) *Culture is symbolic:* A symbol is a recognized icon of representation that connotes a representative meaning. Symbols are subjective and different from a cultural perspective. They are only valuable when people in society want to use them. Symbols come in form of art, signs, language, money, and so on. Language is the most important cultural symbolic element.
(d) *Culture is integrated:* This is called holism, or it is related to all aspects of society. In order to understand a culture correctly, one needs to understand all parts and not just a part. All aspects of culture are interconnected.
(e) *Culture is dynamic:* This characteristic suggests that culture is being exchanged and developed. Because most cultures are connected to other cultures, and ideas and symbols are shared. All societies are changing, otherwise it will be difficult to adapt to changing conditions. With the interconnection of cultures, if part of a system changes, the whole system is likely to adapt.

A closer look at every aspect of cultural characteristics in relations to development shows that one cannot discuss the sacrosanct characteristic of culture in relations to development without understanding how culture is exchanged. Material culture such as art, objects, and music, for example, are mostly learned formally today, while the nonmaterial is being learned informally. However, this culture-born learning cycle has become the cultivation of various roots in development. Likewise, what we have in commerce today can be compared to the word "culture is symbolic and integrated." Symbols and signs of our daily life have become omnipresent. Simplified colloquialism has merged with our subconscious while we manage our everyday life in many circumstances. Modern representations are transcendent,

transmedia, and transcultural. Symbols can be divided into three main groups, most of which are intended to define, explain, and create meaning. Early symbols were clearly used for a completely different purpose. Today, we mostly associate symbols with brands and trade – to fix confusion. In addition to all the cultural characteristics defined by Scupin (2019), culture includes a learning community. Culture reflects both trust and attitudes in a network of equal values that is held by the civil society. Culture shapes the brain and creation of the mind. This is because the mind is not a biological building, but a culturally built unit. Hence, the key game of creation is the mind built into culture. There is therefore no excuse for cultured society to stay underdeveloped. Development is a goal that completes culture, and therefore the link between culture and development is inseparable and indefinite.

## Definition and Nature of Development

Development simply means making life better for everyone. Considering the level of inequality worldwide, a better life for many means, meeting basic needs (such as food, shelter, clothing, education, good health, dignity, and respect) adequately and sufficiently while for some others, it means sustaining "high mass consumption." Generally, development is measured quantitatively (such as increase in Gross Domestic Product, and higher number of telephone users) and qualitatively (such as improvement in people's well-being, and increased access to infrastructural facilities including the vulnerable). In local and global academic discussions, the idea of development is fundamental considering its multidisciplinary nature. In developing countries, there seems to be no consensus on development path among writers, scholars, and theorists (Teng et al. 2016). Nevertheless, according to Vaggi (2018), the concept of development is used in three main senses. First, as a state of vision, interpretation, and measure in an ideal society. Second, as a cycle of social change that transforms societies over long periods of time. Lastly, as concerted attempts to strengthen various institutions, including states, all types of organizations, groups, and social movements. Development therefore has several meanings and these meanings are interrelated, largely because the historical process is regarded as an explanation of the ideal state of society, and the latter can be the result of seeking change through direct efforts. As a result, the creation of the state of existence has been controversial for many years, and different political ideologies have led to different concepts of an ideal society.

In this context, development is seen as a method that can realize the capabilities of everyone in a modern industrial society, or as a way to alleviate poverty (Vaggi 2018). From 1950s to the 1960s, development was seen as the modernization of the industrial revolution that led to economic growth and development. The United Nations Development Programme (2018), clearly states that development is a long-term and secured existence which enables access to resources to achieve a decent standard of living and to be able to participate in community life. In addition, Teng et al. (2016) regard development as the core value of improving and realizing sustainable development (continuous ability to meet basic needs), self-esteem (meaning and respecting a person's facts), and freedom from serfdom (or the ability to choose and change a specific desire for legal existence). From the foregoing, development at the level of individuals, social groups and communities is thus conceptualized (United Nations Development Programme 2018).

Development includes social, economic, political, cultural, and human growth. Development as a specific term has been discussed extensively in the literature with the aim of achieving social, economic, and political development. However, in recent times, the focus of discussion turned from industrial and economic development to the transformation of society in terms of people's wellbeing and their sociocultural elements. Indeed, economic growth can bring material benefits to people, but development has a lot to do with enriching people's lives in society. Hence, development is not only about material things but also about people's well-being. On this premise,

next sections examine the concept of development from three different perspectives: Social development and sustainability (which emphasis path toward modernization in all ramification), economic development (associated with nationalism and capitalist development), and political development (which emphasizes the development of democratic principles).

## Culture and Social Sustainability

Formerly known as social development, social sustainability and inclusion is all about creating inclusive and resilient societies whereby people's voices, including the vulnerable, are heard and responded to. This is achieved by removing barriers preventing people from full participation in society, creating social opportunities for all (both today and tomorrow), and increasing inclusive growth regardless of people's gender, age, religion, race, ethnicity, or disability. The onus of attaining social sustainability across the globe lies with the involvement of state actors, nonstate actors, community members, and citizens of every nation. The role of culture in achieving social sustainability therefore becomes indispensable.

Human beings are social beings; organizing themselves into different forms of social groups, such as nomads, settlements, and countries. In these organizations, humans work, trade, entertain, reproduce, and communicate in many other ways. Sustenance of these cultural traits over a period of time is made possible via socialization. Compared with other species, human socialization is combined with systematic social and organizational improvements over time. Therefore, the model of human society varies from place to place, from age to age, and from culture to culture, thereby creating a very complex and dynamic framework for the social world in which everyone is born into. The social and cultural environment in which everyone finds her/himself consist of family, houses, schools, social class, communities, language, religion, religious groups, and both implicit and explicit rules and regulations, among many others (Oyekola 2018). These environments continue to shape how people think, act, and react. The way people respond to all these influences, even the most powerful ones, is unpredictable. Nevertheless, the way people react to the same stimulus pattern is very similar, that is, proposed in the same community. In fact, culturally influenced behavior patterns (such as speech patterns, body language, and emotions) are so deeply rooted in the human mind that they often function without being fully aware of them (Keller 2020). Hence, it is these environments that create opportunities for some, while at the same time create barriers for some others thereby limiting the opportunity for the attainment of social development and sustainability.

However, from a sociological perspective, people believe that cultural environment has a great influence on cultural beliefs. The first explanation is that people like to communicate. This means that they have new values and knowledge and if members from different cultures stay connected for a period of time, they will get used to new values. For them, it will no longer be new. New cultural values will become the norm, and people's lives will begin to embrace them. In addition, when we say that culture is the development goal of social ideals or that culture has an influence on the social development and sustainability of individuals and the entire society, we are making a valid statement which is applicable to different parts of the world and applies to all contemporary civilizations. Of course, society will internalize certain values in its policies, traditions, and systems in different ways and degrees. Similarly, although human society is unique and develops at different speeds, the impact of culture on social development and sustainability is obviously huge. This may also affect the speed at which society reaches different milestones in development. It is worth noting that the experience of cultural differences can also help to evaluate which cultural elements affect the development process of all societies.

## Culture and Economic Development

There seem not to be any discussion on economic development without economic growth because it

is the latter that engenders the former. Simply put, while economic growth, as an aspect of economic development, focuses on how gross domestic product (GDP) can be increased and how market productivity can be enhanced, economic development examines how policy interventions geared towards economic growth have improved general well-being and quality of life. Recently, researchers in community economic development have extended the focus of economic development to include socioeconomic development whereby improvement in people's well-being and quality of life becomes the target and goal to be achieved (Collier 2017). Culture, on the other hand, has social, economic, and environmental influences worldwide and is a powerful driving force for economic development. As discussed prior to this section, culture is mainly responsible for the lifestyle of people, their economic behavior, their consumption lifestyle, and their interaction with the natural environment (United Nations Educational Scientific and Cultural Organization 2020). If development is seen as improving people's productivity and living standards, then development efforts cannot ignore culture.

Economists tend to narrowly describe culture as "common beliefs and values that have been passed on relatively unchanged from generation to generation through ethnic, religious, and social groups" (Guiso et al. 2006). This approach is primarily based on the goal of defining causal interactions by focusing on culturally constant aspects over time. Not surprisingly, anthropologists have written some of the most revealing writings on the subject. Scupin (2019) believes that society is a social model system. This is not a legacy, but a result of learning. Likewise, Collier (2017) emphasized the evolution of economists, viewing culture as "building an arsenal or 'toolbox' that people use to formulate action strategies economically." More so, the status of culture is naturally the inherent instinct of creating green jobs, reducing poverty, making towns more resilient, ensuring safe access to food and water, maintaining natural resources such as forests, and improving the adaptability of communities in the face of disasters (Guiso et al. 2006). As such, the ability to preserve, maintain, and maximize this natural resource essentially influence the economic developmental level of a certain society.

Culture plays an important role in understanding economic development. For example, South Koreans advocate thrift, hard work, investment, education, planning, and discipline, which influence their ability to maximize available resources, and these have influence on their economic development. Hence, work values in every culture determine the level of economic growth and development. However, this is still debatable as every society would want to claim that their culture is the best since no single variable can be a determinant for the relevance of a certain culture. More reason why discussions about cultural norms is avoided by international financial organizations and bilateral participants (Lopez-Claros and Perotti 2014). Furthermore, taking this discourse from another approach, when studying modern culture, we can see many influences that culture has on business. In business meetings where people from different cultural backgrounds communicate with one another, cultural differences must be considered. It is not only necessary to overcome the language barrier. These differences may involve people's sensitivity to time, ways of communicating, ways of taking risks, ways of making decisions, and thinking about others, all of which need to be addressed. Cultural differences usually affect the success or failure of multicultural business negotiations. Unless the target market for the product or service is segmented, the company may spend time researching the cultural beliefs and beliefs of various communities. Culture affects personal tastes and desires, and not all audiences use the same methods. For example, Americans have different views on advertising and marketing from Asian consumers. From design to marketing and the entire product life cycle, companies need to consider changes.

In addition, economic potential is a product of a country's culture, which has been believed and developed over a period of time. Enhancing it means studying the dominant constructive principles, values and ideas. For example, encouraging the poor to develop small businesses, giving them soft loans and grants, or providing them with

business skills in order to eradicate poverty in developing institutions and governments of Africa might be a bit controversial and insufficient. This is because eradicating poverty involves re-orienting people and imparting them with cultural values and principles (such as diligence, thrift, labor, integrity, and discipline) that will change existing "traditional" norms and bring about positive results. In many African societies for instance, it is believed that all that is earned in a day must be expended on that day and that God will provide for the next day. Such belief system has capability of hindering business growth and in turn economic growth. Therefore, the influence of culture on economic growth and development cannot be overemphasized.

## Culture and Political Development

Political development generally refers to the advancement in the institutions, values, and attitudes that constitute the system of political power of a society. It involves positive change from inefficient, ineffective and corrupt public administration toward efficient, effective, and non-corrupt governance. Usually, the capacity of a state is enhanced to mobilize and allocate resources, and to transform policies into actions when political development is in place. However, the development of political system in a given society cannot be possible without corresponding cultural traits and values. Culture describes what people think is moral or immoral; right or wrong. It relates to and determines loyalty, legitimacy, sanctity, coordination, order, and teamwork. The degree to which society demands independence, justice, allegiance, or advocacy for authority varies from culture to culture. To live and prosper in any given society or culture, every individual must interact and associate with other individuals in the same culture. As long as people interact, teamwork is inevitable and that cannot occur properly without leadership and political sets. According to Carmines and D'Amico (2015), every leadership is motivated by an ideology, which is frequently turned into a political structure (Carmines and D'Amico 2015).

Society is very important to human life. There is therefore the need for institutions that can ensure the functioning of society. For this reason, culture and government are the main institutions that keep society united. Comparatively, culture retains the traditions and practical wisdom inherited from ancestors, while the government uses laws to organize society. The purpose of politics therefore is to ensure the adoption of ideal model, at every point in time, for managing and governing people and resources of a society for the safety and well-being of that society. In the process, political system is being developed. As such, culture influences the daily state of society and its development, determines the essence and form of policies and transforms them. Therefore, culture plays a vital role in determining the path that politics should take; it is the foundation for forming and regulating social norms.

## Culture and the Realization of 2030 Development Agenda

At the beginning of the second millennium in the year 2000, world leaders met to design eight common global goals to be achieved across the globe in the next 15 years. At the end of the proposed years when the goals were to be achieved, it was realized that many people, cultures, nations, and countries were left behind. One major factor that hindered the realization of the Millennium Development Goals (MDGs) was the inability to consider cultural differences and diversities (United Nations Educational Scientific and Cultural Organization 2020). In order to correct some defects in the design and implementation of the eight MDGs, a more inclusive and comprehensive consultation was made and that led to the designing of a more wide-ranging 17 Sustainable Development Goals (SDGs) to be achieved in 15 years beginning from September 2015. Culture has a key role to play in order to realize the 2030 global development agenda. In order words, culture represents a vitally important pillar for the attainment of SDGs as each SDG has targets that are indirectly or directly related to culture. For example,

the culture of brotherliness can go a long way in eradicating poverty and hunger in all its forms, and equal access to cultural services such as education, aesthetic enjoyment, physical and mental health, as well as spiritual experiences can contribute to "reduced inequalities." In addition, health policies and programs that account for local customs and integrate traditional health systems and practitioners will go a long way in ensuring healthy lives and promoting wellbeing for all across ages, and understanding of the link among traditional knowledge, cultural practices, and environmentally sustainable activities will help in combating climatic change. Involvement of international, national, and local actors with diverse cultural orientations is therefore indispensable if SDGs will be realized. In other words, all sustainable development stakeholders must integrate cultural dimensions and their capacities must be strengthened in order to realize the SDGs. Hence, development of strong and solid cultural policies is essential if SDGs will be achieved. Any development agenda that fails to put into consideration cultural diversity and uniqueness will result in illusory development. In other words, for sustainable development goals to be realized worldwide without leaving anyone and any culture behind, cultural differences and distinctiveness must be valued and appreciated. Otherwise, (global) efforts geared toward the attainment of 2030 development agenda will not translate into (global) results. This is because the most successful and possibly sustainable, inclusive, and fair result is a strategy that responds to and promotes a people-centered development approach in various but specific cultural contexts.

## Conclusion

Culture affects all aspects of our lives. It has wide range of influences on human society and development including decision-making and protection measures, the development of social values and traditions, and the status of interpersonal relationships. Generally speaking, the status, direction, and development of social, economic, and political activities are usually influenced by culture. This makes culture the central determinant of individual and societal development. Global leaders recognized this and therefore emphasized the need for cultural analysis before the introduction of social, economic, and political policies geared toward the attainment of development agenda. Culture is therefore very influential in creating and maintaining social, economic, and political norms, values, and policies that will help in shaping people's ideas, attitudes, and personalities, community conventions and habits, as well as global development agenda. With global development being realized in many local cultures, we see the development of many local cultures meeting up with global realities. Nowadays, most communities are multicultural, with more and more people traveling, socializing and collaborating with other people from all over the world and different cultures thereby aiding the developmental process.

## Culture and Organizations

Patrick S. Malone
American University, Washington, DC, USA

### Synonyms

Organizational climate; Organizational environment

### Definition

Organizational culture refers to the climate of an organization including rituals, behavior, unspoken norms, spoken norms, inherent values, what is and is not acceptable, communication modes, and behavior.

### Introduction

The definition of organizational culture may include a wide assortment of variables. In its simplest terms, organizational culture refers simply to "the way things are done around here." Organizational culture may include the values, language, principles, beliefs, assumptions, expectations, attitudes, customs, written and unwritten rules, and behaviors, in any entity that are considered acceptable and appropriate. These factors work together to create a social and psychological climate wherein the organization operates day to day. Because of the complexity of the psychosocial and environmental factors contributing to organizational culture, organizational cultures are unique to the organizations in which they exist.

### Manifestation of Culture

The observable aspects of organizational culture may be seen in two primary ways in an organization. Evidence of culture are evident through and examination of symbolic and behavioral aspects of the organization. Taken together, these two lenses account for the complexity of the diffusion of politics, power, human nature, and internal and external influences that make up organization cultures.

#### Symbolic

Bolman and Deal (2008) suggest that much of an organization's culture may be revealed and communicated through symbols. These include myths, visions, values, heroes, stories, rituals, ceremony, and metaphor. The presence and content of these symbols provide clues as to the nature of the organizational culture, its attributes, and its challenges.

*Myths, vision, and values*. Organizational myths may find their genesis at any time in an organizational lifecycle. It is very common for myths to be attributed to the early days of an institution and may include stories about founders working in garage, scientists spilling something on their clothing, or act of extraordinary courage or sacrifice. These stories form the foundation of the organization's values and give the employees a sense of what matters most. Indeed, it is a strong connection with organizational values that allows an individual to feel efficacy in their work and a strong commitment to the goals and mission of the

organization. Vision, far from being a fairytale look at the future, allows individuals in the organization to connect the history and core concepts of the organization to a future pathway of performance and success.

*Heroes and heroines*. Heroes and heroines may come from any level within an organization and may be represented by individuals or by groups. These individuals or groups provide a common rallying point for organization from which to build momentum. They fuel organizational values noted above and contribute to the myths and stories that enrich organizational context.

*Stories and fairy tales*. Like myths that are specifically related to the organization itself, stories may or may not find their origin in the organization. Stories could entail any individual whose behavior is reflective of the values the organization espouses. These often take the form of extraordinary service or sacrifice of an organizational employee in pursuit of the organizations goals. For example, a teacher that spent extra time with a needy student, a police officer who adopted a homeless child discovered on a city street, or a janitor who noticed a patient in need in a hospital setting.

*Rituals*. Rituals provide a very observable set of practices for a newcomer to grasp when joining an organization while at the same time providing a sense of stability and comfort to those that have been in organizations for a very long time. They provide structure and predictability, and thus comfort, for individuals in organizations. They also serve as a connection to the values and mission of the organization.

*Ceremony.* As opposed to rituals, which occur on almost a daily basis, ceremonies are more random and specific in terms of their focus. Ceremonies may include annual meetings, award presentations, retirement ceremonies, or any number of other planned events. As with rituals, they serve to anchor the organization to its greater contextual meaning.

*Metaphor, humor, and play*. Metaphor, humor, and play all accentuate the playfulness of an organization. They allow for organizational members to engage their creative selves while facing conflict or challenge. They have the added benefit of opening up varied perspectives within institutions that support questioning and exploration.

### Behavioral

Behavioral evidence may reveal much about organizational culture. Assessing behavioral intent in communication, power, interests, and politics is a far more tangible endeavor than the symbolic lens and may be categorized as follows.

*Communication*. Marshak and Katz (1992) suggest communication in organizations may come in four forms: metaphor, music, movement, and media. Metaphor includes various figures of speech, puns, or imagery that are used on a day-to-day basis within the organization. Do people refer to the organization as a zoo? Do they refer to the organization as a team or family? Music refers to expression that is shared through voice, tone, pitch, volume, melody, and tune. Are the group discussions within the organization in harmony? Is there a rhythm to the organization? Movement refers to expressions such as posture position, facial cues, etc. Do people often stand when talking or is the atmosphere more relaxed? Do people hug or touch each other as a common course of business? What body language is displayed? Finally, media comprises artistic forms of expression such as painting, drawing, sculpture, and photography. Marshak and Kats ask if an organization's logos, brochures, and reports were examined, what were they suggest?

*Power*. Organizational power may come in many forms including: who gets paid the most, who has a title, who has a window in their office, who has a parking space, or who has access to resources. The source of power can certainly provide clues as to the nature of the organizational culture. How is power dispersed? How is it recognized? What do individuals do with the power that they have? Is power shared among many or concentrated in the hands of a few?

*Conflict*. Conflict lies at the heart of much of organizational politics. Sometimes conflicts are generated that are quite explicit. However, there are other times that conflict resides beneath the surface of day-to-day events. While conflict in and of itself is not a bad thing in organizations,

the question becomes, how is conflict handled? Is it considered to be a positive and creative tool? Does conflict result in gridlock? Or, does it result in a forum for the discussion of new ideas and innovative approaches to organizational challenges? Conflict may occur at any place within the organization but is most common between departments, between levels of the organization, and among various groups within an organization.

*Politics*. The presence of politics within organizations reflects the fact that individuals working in organizations have specific interests, as do departments and divisions within organizations. Recognizing these interests, and understanding the potential conflict with other components the organization, can open the door to a constructive and impactful dialogue. Typically considered to be the bane of organizational existence, politics is actually a very positive force within an organization, and some suggest that organizational politics is at best a tool that anyone can use for the good of the organization. Organizations who use politics in a strategic and focused way are more likely to find themselves successful in meeting organizational goals. The identification of these interests can fuel an organizational culture that is be bereft of careerism, gamesmanship, turf protection, and rigidity.

## Subcultures

In much the same way that a comprehensive organizational culture impacts serves an organization, there may be a number of subcultures within the organization operating in a like manner. For example, in a hospital there may be a culture of the physicians, laboratory technicians, and lawyers. Within the Navy, there are distinct and separate subcultures for surface warfare officers, aviators, and submariners. A common challenge in organizations with numerous subcultures is the need to focus the impact of each subculture on the overarching goals and values of the organization at large. This requires significant leadership skill as well as a very clear understanding of the components of each of these cultures.

## Impact of Culture

A significant body of research has pointed to a direct impact between organizational culture and organizational performance. Organizational culture is often cited as one of the primary reasons that organizations either fail or succeed and may drive employee satisfaction, turnover rate, and profit margin. Further, environments that are marked by learning, fun, innovation, and mission focus are commonly associated with organizations with much success. Public sector organizations such as NASA, the Department of State, and the Department of Transportation are perennial top three selections for the best places to work in the federal government. In the private sector, organizations such as Google, Southwest Airlines, and Edward Jones are known for the positive impact their cultures have upon bottom-line performance.

## Assessing Culture

Because of the multiple variables impacting the presence of organizational culture, assessing culture can be an arduous and difficult task. Advocates of a qualitative approach to examining organizational culture argue that because culture is highly subjective, often hidden, and unique to the entity, a qualitative approach is necessary. Those arguing for a more quantitative approach are best suited to focus on specific aspects of organizational culture. In truth, the most impactful techniques to uncover organizational culture are mixed methods that use the strengths of both approaches. Depending on which aspect of organizational culture is being investigated, either a qualitative or quantitative approach will generally fit the purpose. Three common approaches in diagnosing organizational culture include the behavioral approach, the competing values approach, and the deep assumptions approach (Cummings and Worley 2005). When used properly, any one of these three approaches may yield valuable information about the state of an organization's culture.

*Behavioral approach*. This technique, as the name suggests, focuses on the observable behaviors of members of an organization. This type of analysis allows for assessments to be made to determine whether or not organizational culture is in need of change to support future strategic directions. This technique may focus on particular organizational behaviors such as communication, organizing, monitoring, decision-making, innovating, and rewarding.

*Competing values approach*. This organizational assessment technique spotlights the complementary nature of organizational values. When using the competing values approach, the analyst collects data regarding competing values within the organization in order to assess the organization's proclivity for one value versus another. The technique allows for a diagnosis to be made of an organization's flexibility, discretion, internal focus, integration, stability, control, differentiation, and external focus.

*Deep assumptions approach*. By far the most difficult technique for organizational analysis, the deep assumptions approach probes into an organization's most infused values and assumptions. The uncovering of hidden assumptions is one of the greatest benefits as a result of the use of this particular tool. Since hidden assumptions are so hard to find, their discovery can prove very valuable to assessing an organization's culture

### Culture and Change

All too often, organizational culture change efforts fail, and leaders will often overestimate the amount of cultural change they can impose in an organization. Institutions, by their nature, tend to possess an inertia that encourages them to remain stable. This is especially pronounced in public organizations which are highly bureaucratic and decentralized and are typically very slow to change. It is important to recognize that any organizational change that comes is accompanied with fear emanating from the individuals residing the organization. Organizational employees may feel a loss of clarity or focus, feel disempowered, and experience anxiety, tension, or feelings of loss. All of these create formidable barriers to organizational culture change. Typically agency leaders will attempt to communicate the need for culture change but will not take the necessary steps in order to ensure communication is consistent, and incremental successful change steps are accomplished. Additionally, they often fail to recognize how difficult it can be to move people from their comfort zone.

Kotter (1996) offers a well-known and effective approach in organizational change. It begins with establishing a sense of urgency ensuring that organizational leaders identify the competitive realities of the nature of the work and uncover potential crises or opportunities that may occur during the change effort. Once this is completed, leaders are directed to form a powerful guiding coalition of individuals with enough power to be the change agents. This group creates a vision to help direct the change effort and develops strategies for achieving the newly created vision. The next step is especially important, the need to communicate the vision. This is an often underestimated step in that leaders do not communicate enough in general. In attempts to change organizations, leaders are advised to communicate using multiple modalities including in person, email, focus groups, etc. Leaders must then empower others to act on the vision and render the organization free of obstacles to change. It is especially important in this step that support structures be in place that eliminate any barriers to change vision.

Along the path to culture change, it is also necessary to create as many short-term wins as possible. This forms a trajectory and momentum that allows the organization to continue to pursue active organizational change. As credibility is gained, the organization continues to implement new change and improve processes. Once these are institutionalized, the organization is well on its way to a successful culture shift.

## Conclusion

The importance of organizational culture cannot be underestimated. Organizational culture is the operating system of any institution, running quietly in the background but important to accomplishing the organizational mission.

Understanding the complexities of the variables, and their interaction, is tantamount to achieving and maintaining a positive learning culture in any organization. Such cultures have direct impacts on the ways the organization conducts its business, treats employees, clients, and external stakeholders. They also foster freedom in decision-making, innovation, and expression and help employees stay focused on organizational objectives.

## Introduction

The current environment in which leaders must work is characterized by the army term VUCA (volatile, uncertain, complex, and ambiguous), one likened to perpetual turbulent white water (Petrie 2014). It is a political-economic environment that is dizzying and globalized which constantly demands efficiency and stability of organizations (Perucci and Schwartz 2002). These changes can impact leadership development in the trajectory of successfully developing leaders who have the increasing capability to deal with a multiplicity of crisis situations (Probert 2011). This also comes with an enormous cost. The Association for Talent Development (2015), for instance, reported that American corporations are spending $160 billion annually on leadership training and development programs.

Although the environment has changed and the skills needed for leadership have also changed, it had been noted that leaders are not developing fast enough or in the right ways to match the new environment. A cross-country survey conducted by the British Council (2014) on the higher education preparation of leaders in 30 countries selected from country groupings such as Anglo countries, Confucian Asia, Eastern Europe, Germanic Europe, Latin America, Latin Europe, Nordic Europe, Middle East, Southern Africa, and sub-Saharan Africa showed that the study participants did not have undergraduate degrees in leadership studies or related fields although many of them have undergraduate and graduate degrees in the social sciences and humanities. For the participants from the Middle East grouping coming from Egypt, Turkey, and Saudi Arabia, their preparation was more on business, information technology, engineering, and the military, all of which were taken internationally. It can, therefore, be surmised that the leadership studies of these executives were either collateral aspects of their educational or work experiences.

Considering that the development of leaders via collegiate education has been a goal of institutions of higher learning since their inception, the appearance of actual academic majors and minors in leadership is still a relatively recent

phenomenon. The delay may have much to do with overcoming the common perception that leadership qualities are innate, and thus leaders are "naturally born," not made (Prince 2001). Yet several studies suggest that leadership actually can be taught and learned in classroom settings (Buschlen and Dvorak 2011; Astin and Astin 2000; Daloz Parks 2005; Robert 2007; Johnson and Woodard 2014; Mangan 2002).

Leadership educators face the daunting task of creating leadership programs that must meet the needs of diverse learners and stakeholders, including academics and administrators. As Andenoro (2013) noted, the task is both made more difficult and more pressing by the complex charge of leadership education to create a foundation for successfully working with the large number of dynamic organizations and diverse people present in an increasingly global social, political, and economic climate. Student participation in leadership programs must correspondingly encompass many aspects of student development – personal, intellectual, spiritual, philosophical, and skill-based growth (Evans et al. 1998). Colleges and universities are starting to offer a myriad of experiences to build student leadership capacities, including cocurricular activities, social activities, tailored student organizations, immersion programs, weekend community service work, and training workshops (Dugan 2007; Buschlen and Dvorak 2011; Buschlen and Johnson 2014).

A recent examination of the role of civic engagement in 77 introductory undergraduate leadership courses points to the great need for improving undergraduate leadership curricula (Johnson and Woodard 2014). While many well-known universities have developed full undergraduate degree programs in leadership, very little has been available in the academic literature describing the theoretical underpinning or even general characteristics of a successful program. Filling this gap is an important aim of this paper. Perhaps the promise of such training to produce leaders capable of tackling pressing issues of global development and peace in a turbulent world could help convince those firmly entrenched in classical disciplines to accept a Leadership Studies focus (Buschlen and Dvorak 2011; Brungardt et al. 2006; Alexander 2011). As cited by Petrie (2014), "it makes little sense to begin leadership development processes at very senior levels. Instead, the process must start early." The challenge is to think about how leadership development can be democratized to "take it back to the masses – to the base and middle of the socioeconomic pyramid, not only the peak" (Petrie 2014: 18).

## Theoretical Considerations

From the hundreds of leadership programs across the United States and Europe, Perucci and Schwartz (2002) distinguished two predominant approaches in leadership studies and development: utilitarian and communitarian. The utilitarian approach caters to the interest of students in economic security and hence provides the necessary skills needed by students to enter the workplace. The communitarian approach, on the other, caters to the democratic requirement for active citizenship. The rationale of this approach lies in the logic that power resides in the people, and therefore, citizens are expected to exercise leadership roles in advancing a democratic and equitable society. The objective is to foster and sustain the common good. Since students would become future leaders of their communities, they are expected to acquire the necessary skills to make a difference (Perucci and Schwartz 2002). Whereas the utilitarian approach is premised on an economic motivation, the communitarian approach is shaped by political motives.

Perucci and Schwartz (2002), however, argued that both approaches do not portray a complete picture of leadership development. To this effect, they suggested a third approach which they termed the humanistic approach. Accordingly, the humanistic approach combines both economic and utilitarian elements while drawing on the strengths of the humanities in providing a deeper understanding of leadership studies and development. What constitutes the heart of the humanistic approach is the development of a calling among students to translate meaningful knowledge into purposeful action. The three elements that edify the humanistic approach to leadership

development include (1) search for meaning and purpose in human experience, (2) focus on knowledge as the basis for action, and (3) action grounded in a moral ethos (Perucci and Schwartz 2002: 13).

The importance of the past as an element in building leadership development programs also resonates with incorporating the needs of learners in leadership studies. In this regard, Mostovicz et al. (2009) advanced the notion of a leader's timeline and the Theta and Lambda worldviews that influence the choice of learners. The formulation of leadership development programs is found at the intersection of this timeline and worldviews. The leader's timeline consists of the past, present, and future. The past is seated in self-awareness or a deep understanding of one's strengths and weaknesses, drives, expectations, values, and emotions. This capacity is not self-evident but rooted in a cyclic movement of evaluation involving the present and the past. The present situates the leader in the social environment that requires the capacity of understanding the emotional makeup of other people. The focus of the present is on the capacity for empathy. To empathize means the ability to "respect the other's goals and motives" (Mostovicz et al. 2009: 8). The future focuses on purpose. Everyone needs a purpose, and each individual searches for his own purpose based on his or her unique personality.
